FORTHCOMING EVENTS.

Saturday, July 8.

Architectural Association : Second Summer Visit to Hill Hall, near Epping, and the Church of St. John, Epping (Messrs. Bodley & Garner, architects).

Northern Architectural Association : Students' Sketching Club Meeting.

Manchester Society of Architects : Visit to Selby Abbey. Leader, Professor S. H. Capper, M.A.

Tuesday, July 11.

Guild of Architects' Assistants : Visit to British Museum Extension (Mr. J. J. Burnet, A.R.S.A., architect).

Saturday, July 15.

Institution of Municipal Engineers : Annual Meeting of the Western District at Worcester. A paper by Mr. B. Wyand on "Municipal Engineering as a Profession."

Tuesday, July 18.

Northern Architectural Association : Annual Excursion at Wynyard Hall and Grounds.

Wednesday, July 19.

Institution of Municipal Engineers : Annual Meeting of the North-Western District at Manchester.

THE DESIGN OF A HOUSE.

IT is coming to be realised that the designing of a house is something more than the mere arrangement of a number of rooms fulfilling various functions or of the disposition of certain architectural features to form a pleasing exterior, either in a formal or a picturesque manner. Something more than this is needed to render a house a home. And the quality of homelikeness is now by way of becoming recognised as an essential of house design. Moreover, the house in order to be a home must be a beautiful house, and the beauty that it possesses must be of a certain order, and that order must be consonant with the owner or inhabitant. Whether mansion or cottage, some definite idea must be expressed. Hence there is a range of variation in the beauty that the house must possess, and as no two men are in all respects absolutely alike, it follows that no two houses should be absolutely alike if they are to reflect, as they should do, the idiosyncrasies of their owners.

Therefore the house of the future, small as well as large, must be, if a satisfactory home, individualistic. This is the charm and the strength of the Gidea Park experiment. The ordinary householder can better realise from a concrete realisation in the solid the design that most nearly approaches to the ideal that fits him best. But the weakness of Gidea Park lies in the fact that after all the houses are ready-made, and as few men look well dressed in a ready-made suit of clothes, so few will find a completely satisfactory home in a ready-made house, even though it be skilfully and admirably designed by an architect of artistic ability.

The perfect home can only be evolved by an architect who is in touch with his client and who has imbibed something of that client's personality before he makes his design. Hence the presentment of a design is but the first step to success by the bringing together of an architect who produces and a client who requires the expression of a particular idea.

Now the presentment of a design in the solid as at Gidea Park is an expensive matter, and since it cannot, save in exceptional instances, result in the perfect consonance of the householder and his home, it is desirable that some less expensive means should be found of bringing together the architect and the client who are likely between them to bring into being the home that shall be perfectly fitted to and expressive of the individuality of its owner.

One means that has been not infrequently adopted to attain this end has been the publication of books dealing with house design and, more or less frankly, advertising some particular architect. Thus we have before us, at the present moment, two volumes* published by Mr. Batsford, in which a profession is made of instructing the man who is interested in house or home-building in the principles and vital points of house design.

In his review of English House Design, Mr. Willmott has given a charming account of the Old English house, rather from the point of view of design than of history, though necessarily there is so much of historical matter as is concerned with the chronological development of design. The author discourses on the chief principles of house design, which he lays down to be proportion, scale, rhythm, colour and texture. He appears to us to confuse proportion and scale to some extent, although much of his explanation of the latter principle is excellent. This confusion is due to the prevalent lack of precision in speaking, as when we say that two things are "out of proportion" when we mean out of scale. This may be near enough for ordinary talk, but when we come to analyse the

---

* *English House Design:* A review, being a selection and brief analysis of some of the best achievements in English domestic architecture from the sixteenth to the twentieth centuries, together with numerous examples of contemporary design. By Ernest Willmott, F.R.I.B.A. (B. T. Batsford. 10*s.* 6*d.* net.)
The Essentials of a Country House. By R. A. Briggs, F.R.I.B.A. (B. T. Batsford. 7*s.* 6*d.* net.)

227696

principles of art we must be precise in our definitions and in our diction. Proportion as a principle of architectural design does not bear the same meaning as is attached to the word in ordinary everyday language. The proportion between the width and height of an obelisk is a very different thing to the proportion between those of a pyramid. In neither case are these dimensions "out of proportion," but in either they may be good or bad, not by variation in amplitude, but by the existence of consonance or dissonance between them.

So also in our author's discussion of colour, there is a confusion of idea in the assumption of an antithesis between harmony and contrast. Contrasts may be in perfect harmony. They may be on the other hand produced by the opposition of violently dissonant keys, as in the case of red brick walls and roofs of hard purple-grey slate to which reference is made. We must be careful to distinguish between harmony and symphony. The close alliance though not identity between colour and texture is rightly considered and their interdependence well explained.

The influence of Philip Webb, Bodley, Garner, and Norman Shaw on the modern development of domestic architecture forms the connecting link between the author's discussion of old work and his examples of contemporary design, which are well chosen and typical. We may well excuse the inclusion of three houses designed by Ernest Willmott.

The essentials of a country house as enunciated by Mr. Briggs are pithy recommendations what to do and what not to do, generally marked by common-sense and experience and illustrated entirely by examples of what the author has done, and he has done a great deal.

NOTES AND COMMENTS.

We are glad to learn that the Bridge House Estates Committee of the Corporation of London have engaged the services of the following architects to advise them in connection with the building of St. Paul's Bridge: Sir William Emerson, F.R.I.B.A., Mr. T. E. Collcutt, F.R.I.B.A., and Mr. J. J. Burnet, A.R.S.A., F.R.S.Ed., F.R.I.B.A. And we congratulate them on the selection of the advisers they have made. There should now be a truce in polemics, and the scheme that is next put forward by the Corporation, as approved by these three eminent architects, must be accepted without question, whether it be the scheme already laid before Parliament or some other. The ambitious proposers of other arrangements may now pause and relinquish their efforts to press forward their own ideas.

Those of us who expected from the announcement that the new postage stamps would be designed by Mr. Bertram Mackennal that we should at last have something that would take a respectable position amongst artistic work in philatelic collections, cannot help being more disgusted than even the ordinary public at the result. It is characteristic of official ideas of art to think that a satisfactory combination could be made of the decapitated head of our uncrowned King, "reproduced from a photograph," and a frame designed by Mr. Mackennal. The frame is in itself such an unbalanced composition that we should imagine it to be "reproduced" from Mr. Mackennal's design.

We were at one time under the impression that Bournville was a model village, owing its existence and excellence in a considerable degree to philanthropy, but it seems that the effort to make it pay as a commercial undertaking is having the natural result that the rents and rates are too high for the tenants to pay. Additional discontent has been caused by the separation of payment for rates from that for rent. The working man's finance is not strong enough to face anything but a weekly rent. He can manage to pay 8*s*. a week much better than 7*s*. a week plus 10*s*. once a quarter.

That eminent artists do not necessarily make excellent assessors in competitions is somewhat in the nature of a truism, particularly when they, as is frequently the case, make a practice of abstaining themselves from competitions, and have no special experience in the class of buildings upon designs for which they are appointed to adjudicate. Then, again, eminent artists in architecture have not seldom attained their eminence by a skilful disregard of limitations which have hampered their compeers and prevented these also from attaining eminence. A client who wishes to spend £10,000 on a house is persuaded, or forced, to spend £12,000 or £15,000 and gets a fine work of art. Hence, the eminent artist is not inclined, when assessing in a competition, to regard too closely the conditions, and, even though nominated by the President of the Royal Institute, does not feel himself strictly bound by the regulations of the Institute. He sees a fine design and, although it cannot be built for the money and is too big for the site, his artistic enthusiasm will not allow him to rule it out of court, as he should do, according to the conditions of the competition and the regulations of the Institute.

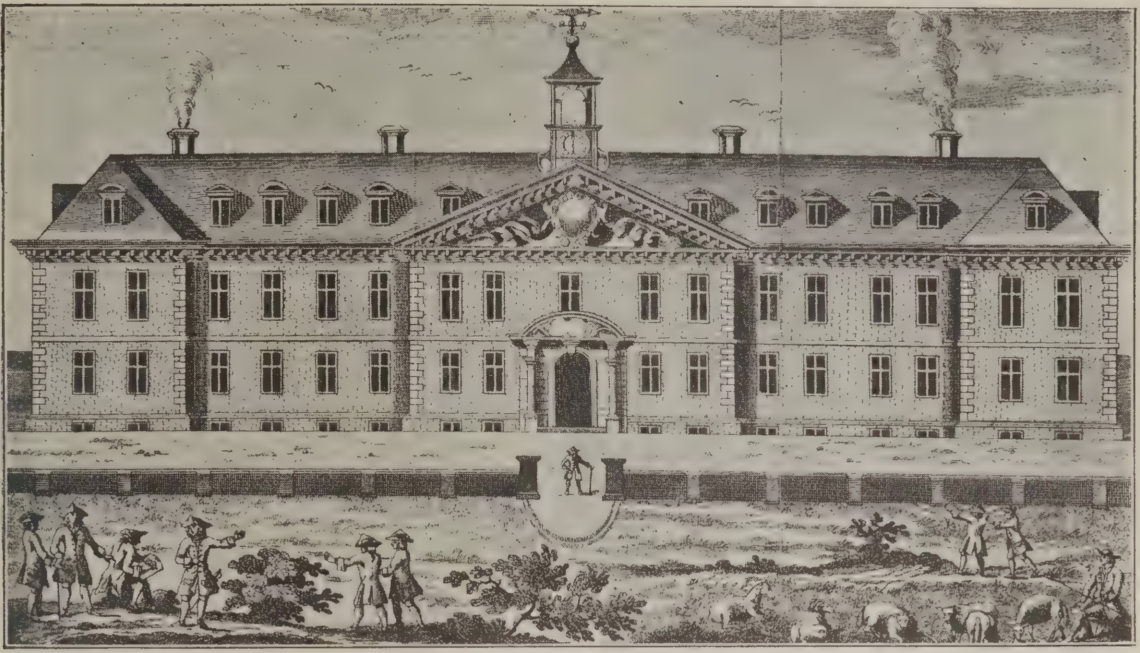
It is not surprising, therefore, to find that in the case of the preliminary competition for the new library and art gallery at Manchester, Mr. Reginald Blomfield, the assessor, has, if the statements contained in a letter to the *Manchester Guardian* by Mr. George H. Willoughby are correct, condoned nonconformity with the conditions of the competition on the part of some of the competitors. True, the variations are, for the most part, not very serious, for we must allow the assessor to use his own judgment in forming an opinion on the cost of the designs before him, and this is the greatest grievance of Mr. Willoughby. Mr. Blomfield thinks that this building could be erected at one shilling per cubic foot. It does not matter in the least if Mr. Willoughby, the city architect of Manchester, and everybody else in the world know better. The opinion of an assessor must be respected even if it be palpably wrong.

The source of all the trouble is that the Corporation of the city of Manchester want too much for the money they intend to spend and the site on which they propose to build. It is more than a tight fit to provide satisfactorily the accommodation demanded on an area of 5,500 square yards for £250,000. Herein lies an advantage of the double-barrelled type of competition. Those architects who are in the first flight have a chance of reconsidering their designs, and the promoters have an opportunity of relaxing their conditions. Competitors who expect literal compliance with conditions should abstain from competitions in which eminent artists without special experience are assessors.

In the *Art Journal* for this month is commenced a series of papers on the interiors of English mansions, Holkham being chosen for a start. The description of the interior is, however, confined to furniture, though some of this is interesting as having been designed by Kent. Furniture forms quite a large part of the contents of the number. "Silver candlesticks of the seventeenth century," described by H. J. L. J. Massé, show some quite architectural designs.

A certain amount of architectural interest attaches to an article on "Some antique mirrors" in *The Connoisseur*, which is accompanied by a large number of illustrations of carved frames. Some Sussex fire-backs are also illustrated, and a coloured plate of the front of the manor house at Hitchin well represents the restoration of this eighteenth-century building. The number for this month is generally more redolent of art than of bric-à-brac.

The account of All Saints' Church, Milford-on-Sea, Hants., by W. Ravenscroft, F.S.A., is concluded in this month's *Antiquary*, with good reproductions of pencil drawings of parts of the building.



THE WEST PROSPECT OF MORDEN COLLEGE, BLACKHEATH. (From Richard Blome's Engraving.)

The Parks and Open Spaces Committee of the London County Council have reported:—Our attention has been directed to the condition of the York water-gate at the Victoria Embankment Gardens. A detailed examination has been made of the structure, as a result of which it is found that the masonry facework is in a condition of advancing decay, while in many places the stone is mouldering. There are also heavy incrustations of sooty matter on the undersides of the projecting ornamental features. We are advised that the decay of the stonework is caused by the action of sulphuric acid in the smoky atmosphere, and that, unless steps are taken to arrest the decay, the ornamental features of the gate will soon be obliterated. In order to preserve the stonework and prevent further decay, we are of opinion that it should be treated with baryta water in a manner similar to that adopted in the case of the Chapter House, Westminster, the effect of this treatment being to re-form the mouldering portions into solid stone of such a composition as to be resistent to the attacks of the atmosphere. It is impossible to state definitely the cost involved by this treatment, but we are of opinion that expenditure of £75 should be sanctioned in respect of the work. There is no provision in respect of the proposed expenditure in the estimates for the current financial year, and, having regard to the necessity for executing the suggested work of renovation as soon as possible, we have asked the Finance Committee to submit a special estimate of £75 in respect thereof. We recommend—*a*. That, as a matter of urgency within the meaning of standing order No. 222 (2), the special estimate (No. 359) of expenditure on maintenance account of £75, submitted by the Finance Committee in respect of the treatment with baryta water of the York water-gate, Victoria Embankment Gardens, be approved as an estimate of costs, debt or liability under section 80 (3) of the Local Government Act, 1888. *b*. That expenditure on maintenance account not exceeding £75 be sanctioned for the purpose specified in the foregoing resolution (*a*). The report of the Finance Committee under standing orders is to the following effect:—The finance committee, having considered in its financial bearings the above estimate, submit the same as chargeable to maintenance account.

MORDEN COLLEGE, BLACKHEATH.

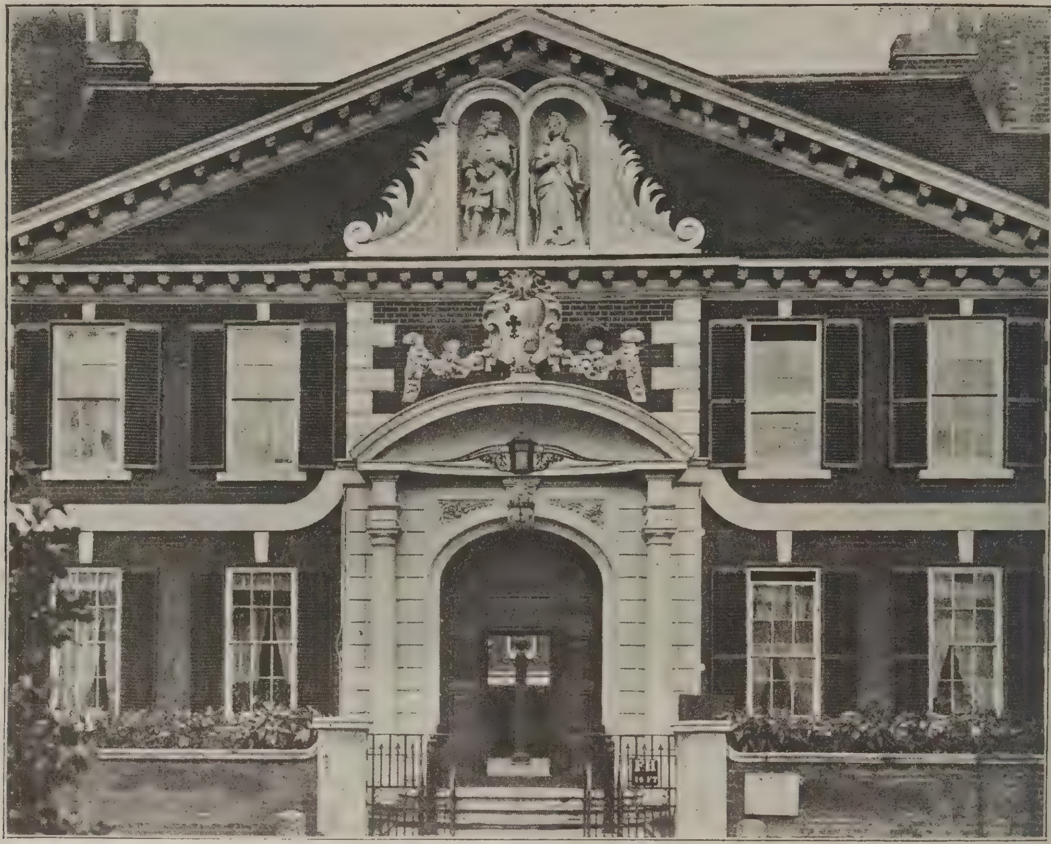
The requirements for which this building was designed are entirely unique, and that Sir John Morden should have conceived the idea of founding and endowing a home exclusively for those who had been at some time extremely wealthy at least convinces us that he was a man of very varied experiences. Unfortunately, little is known of his early history—even regarding the date of his birth there is considerable doubt, for if the registers in St. Bride's, London, are correct, we should have to believe that he was baptised about a week before he was born. It appears from a record preserved in the Heralds' College that he was born on August 23, 1623, and was the son of a certain George Morden, a goldsmith of the City of London. We know that at a comparatively early age he became a member of the "Turkey Company," and put his whole fortune in a number of trading vessels, which he sent laden with cargoes on voyages to the ports of the Mediterranean, Aleppo, and elsewhere. Returning to London, he awaited the result of the enterprise. Years went by, and eventually, believing his wealth to be lost, he was reduced to penury and obliged to take service with a tradesman. Exactly how long he was in this position is not known, but at least it was sufficient time for him to realise the hardships of those working under similar conditions around him, and when he again prospered he devoted a large portion of his fortune to the cost of erecting and endowing the College in 1695.

The situation selected must have been well suited for those who would spend their remaining days in peace and quietude. Even to-day, with modern buildings ever increasing in number and narrowly encroaching upon it, the College cannot be thoroughly seen from without its own extensive and well-kept grounds.

Wren was quite at home with any problem he had to face, and here no less that in St. Paul's Cathedral we can notice his amazing resourcefulness and keen imagination. He never allowed mere ornamentality to stand in the way of, or falsify structural necessity, and it would be difficult to find a building in which comfort and effect have been so successfully combined.

It is a little uncertain what his original design was like. If we can rely on the accuracy of Richard Blome's engraving of the College (now in the British Museum), which was made during its erection, it would seem that many deviations were made from his first scheme in the building as it appeared on completion. For instance, the row of dormer windows shown on the engraving never became part of the finished building, and the arrangement of the central portion above the doorway differs entirely from its treatment depicted in the drawing. It may be that owing to the mechanical methods of the draughtsmen of the period, the engraving, like many others, is thoroughly inaccurate. But on account of the care taken in certain parts it seems more likely that it is a fair representation of Wren's first idea, and that such features as the niches containing the figures of the founder and his wife and certain other details were later ideas, conceived, adopted, and carried out as the building arose, and, therefore, did not appear in the engraving that was made before completion.

The building is mainly of brick, with the cornices of wood and some of the more important features of stone. The



MORDEN COLLEGE.—DETAIL OF THE ENTRANCE.

western facade, which is seen on entering the grounds, is a long, low, and well-proportioned front, consisting of a central portion emphasised at the angles by stone quoins and crowned by a pediment containing two niches. It is difficult to quite understand what could have induced Wren to use the extremely unsightly ornament at the sides of these niches. According to the engraving already referred to, they were not arranged for in the original scheme, and were probably designed and executed later by Cibber, the chief sculptor under Wren, who was the author of the very admirable figures of Sir John and Lady Morden at present occupying the spaces.

The entrance doorway, which is of stone, is made up of columns of the Roman Doric order, supporting an entablature and segmental coved head, above which is the shield bearing the armorial devices of the founder and his wife, the carving both here and elsewhere in the building being the work of the Grinling Gibbons school.

The wings to this façade are treated with great simplicity, being quoined at the angles, and having on their inner sides two splendid doors, which have recently been blocked up. Originally, all the windows had mullions and transoms, and were fitted with casements; these have now been replaced by sash frames, and external shutters added.

The general effect of this simple façade is not unlike the front of the Widows' College in the Close of Salisbury. It was founded by Bishop Seth Ward a few years earlier, and is generally believed to be one of the several probable designs by Wren in that district. Considering the similar uses for which the two buildings were intended, it is not unreasonable to suppose that the latter example is actually the prototype of the finer and altogether more mature College at Blackheath.

The internal court of Morden College is thoroughly in keeping with the general external design, and is certainly quite as fine. It is rectangular in its main proportions, and is entirely surrounded by a cloister which gives access under cover to the forty members' rooms situated around it.

The upper storey is of brick, and is supported on stone columns of the Doric order, placed on lofty bases. Variety and interest are given to each of the four sides by the introduction of piers with three-quarter attached columns. Above the entablature these support pilasters, which are continued to the wooden cornice, and finally crowned by pediments—on two sides triangular and on two segmental.

The vestibule to the chapel lies across the courtyard and immediately opposite the entrance. It is rectangular in plan, the long sides being panelled to about two-thirds of the total height, and crowned by a cornice, ornamented with peculiarly graceful carving, thoroughly characteristic of the Gibbons school. On the east side is a pair of carved and panelled doors, enclosed by an elaborate setting in the form of a four-centered arch with finely carved spandrels. We are told that this doorway was copied a short time ago by a London firm, and erected in the Museum at Vienna.

The chapel itself is interesting, in so far as it shows Wren's extraordinary powers of treating a small interior with refinement and grace, and yet with considerable richness. It is very simple in its general effect; the walls are panelled to just below the windows, and the ceiling, which is of barrel form, springs from a cornice. The pulpit, reredos, and organ gallery are quite exceptionally well designed and executed; the former is perhaps of the greatest interest, as it has inlaid panels, one containing the founder's monogram.

The dining-hall and library are comparatively recent additions, the latter being erected in 1861 at the bequest of Charles Kelsall, of Hythe, a son of a former member of the College. The piece of tapestry in the hall representing David returning in triumph from the slaughter of the Philistines is said to have been worked by Lady Morden, and hung in the chapel prior to its removal to the present position. There are two good portraits of Sir John and Lady Morden painted by Sir Peter Lely, also the coat, spurs, and heraldic trophies used at the founder's funeral. The billiard-room and kitchen complete the College buildings. The latter is a fine, large apartment next the hall, still remaining in much the same condition as when first built.

The suite of apartments for each pensioner consists of a living-room, bedroom, and a bath-room for every two. All the rooms are extremely comfortable, well-lighted, and of a convenient size. Originally, the members wore the College gown bearing an oval silver badge, on which were worked the arms of Morden and Brand (the maiden name of his wife). The use of this gown was, however, soon discontinued, each wearing clothing according to his own taste.

This is somewhat different to the usual class of building that Wren designed, and shows the great versatility of his powers. Indeed, although more than two hundred years have elapsed since the foundation of the College, little could now be done to further add to the comfort of the members, and certainly still less to improve the design as a whole. It is in a building of this description rather than in some of his more pretentious works that we can best appreciate the art of

MORDEN COLLEGE.—THE WESTERN FACADE.

Wren, and realise the great step forward that he made in English architecture.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Annual Dinner of the Royal Institute was held on Tuesday, July 4, at Fishmongers' Hall, Adelaide Place, London Bridge. The chair was taken by Mr. Leonard Stokes, President. Those sitting at the presidential table were His Grace the Lord Archbishop of Westminster, the Lord Mayor, the Lord Saye and Sele, Mrs. Leonard Stokes, Sir Edward Poynter, Bart, P.R.A., Sir L. Alma-Tadema, O.M., R.A., Sir Thomas Barlow, Bart., K.C.V.O., Mr. Edward White (Chairman L.C.C.), Sir H. T. Butlin, Bart., Mr. H. A. Miers, F.R.S. (Principal of the University of London), Alderman Sir C. Johnston, Sir Henry Buckingham, Sir Henry Morris, Bart., Sir William Emerson, Sir James Linton, P.R.I., the Hon. John Wanamaker, Sir Edward H. Busk, Sir Charles Lawes-Wittewronge, Bart., Sir Frank Short, R.A., Sir Ernest George, A.R.A., Sir Aston Webb, C.B., C.V.O., R.A., Very Rev. Professor Inge, D.D., Judge Rentoul, Sir Thomas Brock, K.C.B., R.A., Mr. Edgar Horne, M.P. (President of the Surveyors' Institution), Mr. Philip Morrell, M.P., Mr. Gerald Horsley (President of the A.A.), and Sir Lawrence Gomme, F.S.A. Among the other guests were Mr. Frank Dicksee, R.A., Sir C. Henry, Bart., M.P., Mr. W. Goscombe John, R.A., Mrs. Goscombe John, Mr. G. Bird Godson (President of the London Master Builders' Association), Mr. W. Fleming (Secretary of the Royal College of Physicians), Mr. J. W. Domoney (Chairman of the Bridge House Estates Committee), Mr. G. E. Bond (President of the Society of Architects), Mr. James S. Holliday (President of the Institute of Builders), Sir J. Wrench Towse (Clerk of the Fishmongers' Company), Mr. J. G. White (President of the National Federation of Building Trades Employers), Mr. Henry C. Charlewood (President of the Northern Architectural Association), Professor Beresford Pite, Sir Brumwell Thomas, Mr. Henry T. Hare, Mr. L. A. Atherley-Jones, K.C., M.P., Mr. C. MacArthur Butler (Secretary of the Society of Architects), Mr. T. Costigan (Secretary of the London Master Builders' Association), Mr. S. Forrest Cowell (Secretary of the Royal College of Surgeons), Mr. Paul Waterhouse, Mr. John W. Simpson (Vice-President R.I.B.A.), Mr. James S. Gibson, Mrs. Gibson, Mr. P. F. Rowell (Secretary of the Institution of Electrical Engineers), Mr. J. Y. W. MacAlister (Secretary of the Royal Society of Medicine), Mr. Marion H. Spielmann, Mr. Lewis Hind, Mr. A. G. White (Secretary of the National Federation of Building Trades Employers).

The toast of "The King" was given by the President. It was followed by the second loyal toast, viz., "Queen Mary, the Prince of Wales, Queen Alexandra, and the other members of the Royal Family."

Mr. H. A. Miers, F.R.S., Principal of the University of London, proposed "Architecture and the Sister Arts." He said his ignorance of the subject of the toast reminded him of the situation of a certain Englishman who found he was the only Englishman present at a dinner attended exclusively by Scotsmen. In proposing a toast he announced he was a Scotsman, and when the applause had died away he added, "neither by birth nor by inclination." But he at any rate could say that he had had an interest in architecture ever since the time when he was led to play truant after reading Parker's "Glossary of Architecture" in order to visit a neighbouring church. No one could have had such a career as he had had without realising what a part architecture plays in life. No doubt the position now occupied by Oxford and Cambridge was partly due to their buildings. When he came from Oxford to London he was struck not so much by its inspiring influences as by the deplorable design of some of its buildings. Some years ago he had been asked by a professor to say where buildings expressing an idea were to be found. He found it quite difficult to find out the desired kind of structure in London. London University was typical in its shortcomings. For instance, it had no hall or residence which it could call its own. Even the cabmen hardly knew where it was. Indeed, there seemed to be some confusion between London University and a Union. He was ashamed to confess that before he entered the room he did not know which were the sister arts. An attempt was being made in London, through the enterprise of Professor Geddes, to have in Crosby Hall buildings which were suitable to their surroundings. He had often been struck in this country by the need of that alliance between sculpture and architecture which is so splendidly manifest in Greece. Nowadays the ordinary traveller fails to realise the important part which sculpture played in old buildings. Visiting gallery after gallery containing a large number of examples of detached architectural sculpture, they cannot get an idea of their appearance on the buildings where they first stood. One of the present needs of London was that it does not possess a sufficient number of casts from the antique. There was now being held in London an exhibition of the discoveries by Professor Flinders Petrie, which takes one back to the beginnings of

MORDEN COLLEGE—THE COURTYARD

painting. He knew that the English were not to be regarded as an artistic nation, but there was now a desire for the artistic application of architecture in the development of building estates. The authorities of London University were endeavouring to take some steps in the furtherance of architectural education by combining the two schools so as to make one large school which would, he hoped, have the support of those interested and of all architects. He hoped to be soon able to say they were teaching sculpture. The University appreciated the value of architecture and the sister arts and in every way encouraged them.

Professor A. Beresford Pite, F.R.I.B.A., who responded for Architecture, said his colleague, Professor Blomfield, had designated architecture "the Mistress Art." He offered no apologies for that, and he did not hesitate to accept the pedigree and the compliment. But regarding them as sister arts, what an extraordinary insubordination there was among those sisters! That fact could not be denied by any keen observer. Architects begged their sisters to try and restore that mental equilibrium which at one time prevailed. But there was now a larger and deeper interest in the beauty of our cities at large. The man in the street could not close his eyes to the buildings around him in the streets. He would venture to congratulate the Lord Mayor upon presiding over one of the most beautiful cities in the whole world. Within her limits were the Palace of Greenwich, Somerset House, Waterloo and London Bridges, to say nothing of St. Paul's Cathedral and a crowd of Renaissance buildings such as no other city possesses. What other city had such a collection of mediæval structures as the Tower of London, Westminster Hall, St. Bartholomew the Great, the Temple Church, and Westminster Abbey? Architecture in London was certainly well served in the past. It was difficult to speak of the future. Town-planning was architecture in its largest ideas. Parliament had recently conferred on the Corporation the honour of opening up and exhibiting a view of St. Paul's which would be unrivalled. They congratulated the Corporation upon getting the assistance in the matter of the proposed Thames Bridge of three of the Institute's distinguished members, men in whom they felt the greatest confidence. But he would suggest the question was too large to be left to architects. It concerned everyone; it affected the dignity of the whole City, and their appreciation of the greatest monument of Renaissance art we possessed as a nation. Nor was he sufficiently sanguine to believe that the solution of that problem is quite near. It is complicated by such questions as the safety of the dome and financial matters. But public influence would, he was sure, support the Corporation in any scheme which was sufficiently large to do justice to St. Paul's. They hoped to be able to drink at no very distant date the health of St. Paul's Bridge.

Sir Edward J. Poynter, P.R.A., replying for Painting, said he felt some difficulty in approaching a subject so vast, in view of the very brief limits imposed, for, short of a studied lecture, there was no way of dealing adequately with a topic so complicated and so questionable in its aspects. Nor did he know exactly how he should best return thanks for Painting as an abstract proposition. If the toast was intended as an expression of a kind wish for the prosperity of the art from a commercial point of view, he wished to summon the ghost of Sir Joshua or one of his contemporaries to reply to it, for in the picture market they are experiencing a success which many painters of to-day may well look upon with envy. As for the *success d'estime,* he might truly say that the English school has of late years gained it in a remarkable degree. In all international exhibitions held in the last twelve or fourteen years the English painters have, to say the least of it, shown themselves second to none, and notably at the present exhibition at Rome, where the English section is acclaimed as the most distinguished feature. He would venture to say that if the English school of painters—he disliked the word "British," although that was what he meant—will keep their individuality and cultivate that love of beauty which has been its distinguishing characteristic from the days of Reynolds, Constable, and Turner, he ventured to affirm that they had nothing to fear in any competition for honours in the world. Painting and Sculpture were, by the toast, rightly linked with Architecture. Painting takes its highest form and fulfils its noblest function when used for the decoration of great works of architecture. It was the first use to which painting was put, and the majority of its greatest works were produced for such a purpose, adding a lustre to ecclesiastical and public buildings and private palaces which frequently outshines the edifices which they adorn. Such works as those of Michel Angelo and Raphael in the Vatican, of Giotto in the Arena Chapel, of Ghirlandajo in Santa Maria Novella, of Tintoretto in the Scuola of San Rocco, were a few among hundreds of examples which the combination of painting with architecture presented in Italy alone. If these buildings would suffer by the loss of the paintings, it might with equal justice be said the painter would never have risen to such heights but for the architecture whose beauty he was called on to enhance, for the treatment of great spaces in noble architectural surroundings led to the highest form of expression which the art of painting could achieve. He had frequently dwelt on the importance of giving opportunities of this kind to painters. The mere fact that an artist felt himself to be working for something that would permanently appeal to the public, that he was doing something of national importance, was a stimulus to him to bring forth both his intellectual and his artistic faculties to their highest use. Such efforts were the best antidote to that loose method of work from nature which too often formed the staple of exhibitions. He sincerely hoped, in the interests of art, that public spirit would not stop at the completion of the corridor in the House of Lords which had proved such a success, but would carry forward further the scheme of decoration originally proposed for the Houses of Parliament. There was another field of association. From the time of Giotto to that of Tintoretto there was not a painter in Italy who had not a thorough knowledge of architecture, and did not understand the value of architectural backgrounds and accessories as an adjunct for his compositions. Those in this country who are capable of so enriching their work might almost be counted on fingers of both hands. This lamentable ignorance of a great and closely allied art was a serious handicap. It was his hope that in the Royal Academy schools a course of architecture would before long be imposed on the painter students, instead of being taken as a voluntary exercise.

Sir Charles Lawes-Wittewronge, Bart., President of the Royal Society of Sculptors, in replying on behalf of Sculpture, said that sculpture was a particularly difficult form of art; it was more difficult to practise that art than to talk about it. Nothing very fine in sculpture had been executed apart from architecture. The Royal Society of Sculptors was only a young society, but they have had a good beginning. They were immediately recognised by the Board of Trade, who entrusted them with the organisation of sculpture exhibitions. There were two in the present year, viz., that at the White City and the other at Rome. To-day the architects of this country were looking more towards sculpture for the decoration of their buildings. He was confident that English sculpture of the future would hold its own with all the schools of the world.

Sir Aston Webb, C.B., C.V.O., R.A., remarked, in proposing his toast of "The Houses of Parliament," it was usual on occasions of that sort to say that Parliament had little to do with matters of art. But in the past two or three years Parliament had had more to do with questions of art than before. The House of Lords had dealt with several important matters, including the decoration of their own House. The House of Commons had in the last few days expressed their opinion on a very important question. Up to the last moment it was not known what the result would be, and it was, perhaps, the first time the House of Commons had given their opinion on such a matter. Then there were the measures for town planning. As that Act was more and more used it would be found to be more and more a splendid thing. On such lines as these the Houses of Parliament will assist architecture. Neither they nor any other body can produce designs. But what public bodies can do and are doing is to see that when great public schemes are brought forward they are put before those who are ready to prepare a scheme. It is on the lines of the Housing and Town Planning Act that the Legislature can do so much for the art of architecture and for the people. Bright and healthy homes and beautiful surroundings will increase and multiply the health and happiness of the people of this country.

The Rt. Hon. Lord Saye and Sele said that he could best express the difficulty of replying at the present juncture for "The House of Lords" by describing it in someone else's words as skating on thin ice over a burning volcano. They were engaged in passing a Bill which some thought would build their house and some thought would pull it down. If they were to build their house, they had a very difficult task to perform, as they did not know what the quantities were. They were told there were six hundred noble lords, but throughout his lengthy acquaintance with the House he had never seen more than two hundred. He himself might claim particular interest in architecture as the nearest living descendant of William of Wykeham, as residing in the house he resided in, and as having a son who hoped to be an architect. It was consequently a pleasure for him to be associated with the toast.

Mr. Edgar Horne, M.P. (President of the Surveyors' Institution), replied in the unavoidable absence of Mr. John Burns, P.C., M.P., for the House of Commons. He said he heartily agreed with the suggestion that they, as legislators, were architects engaged in preparing designs, some of a State character and some of a promiscuous kind. Perhaps, however, they were not so much architects as decorators, for they did not think so much of their foundations as of the gold and tinsel trappings.

Mr. Paul Waterhouse, F.R.I.B.A., proposed "The Guests." There was not, he said, very much architecture in the Farringdon Road, but there were barrows. On those barrows they could buy old books and comparatively modern shellfish. He sometimes indulged in the purchase there of books to the extent of a penny, twopence, threepence, or even fourpence. A short time ago he came into possession of a Latin volume by a Dutchman which dealt with the whole art of the entertainment of guests from the earliest times down to his own day. From this book he gathered that the entertainment of guests had very much improved. The author quotes a poet (probably Juvenal) who took this very commercial view, "What on a thriftless wife you spend is money merely spent; but if you use it on a guest it will yield, like money Hebrews lend, interest at 100 per cent." That sentiment was, of course, in thoroughly bad taste. But they, as architects, were aware that they had obtained a company of guests who had given them the greatest possible pleasure. He might be allowed to explain why he had been selected to propose the toast. There was an excellent new rule in the Royal Institute which might be called an insurance against old age. The Institute was ruled (or supposed to be) by a Council. And lest it should be found that old age was the only qualification of some of the members to sit on that Council, a simple piece of machinery has been invented by which the ancient member can be silently removed. Upon himself and upon another member there had just fallen the crown of antiquity. Now it was an English tradition that when a man becomes too old for work he is qualified to make after-dinner speeches. Hence the authorities had chosen him to propose that toast. The solar system was an important part of the universe, the earth is an important part of the solar system, Great Britain is an important part of the earth, London is an important part of Great Britain, and the Lord Mayor is the most important man in London. Those who had studied the record of the present occupant of that high office would have observed that he is fulfilling his functions and engaging in those many interests in which a Lord Mayor may engage—and which are far more than Metropolitan in character. In Sir Vezey Strong they had a man who upheld the traditions of his office nobly and has gone *con amore* into those works in which a Lord Mayor may, so to speak, let himself loose. He was permitted to couple with the name of the Lord Mayor of London that of His Grace the Lord Archbishop of Westminster. It would not be becoming of him to speak of the great organisation of which Archbishop Bourne was the head, and there were others who knew more than he did of his Grace's life of love and service in London. But he could not allude to his church without thinking of the many architects connected with it. Two names especially stood out as combining faith with works, and they came at the beginning and end of a great period of fifty years: Pugin at the beginning and the architect of Westminster Cathedral at the end. Both of these men showed in a conspicuous way how a man's art may be wrapped up in his faith. It could be accounted almost part of his fame that Bentley was so little known. Even when his great work was done he was almost as lost to notoriety as the great builders of the Middle Ages. In conclusion, he would remind them that the Institute were in a sense guests themselves, for they owed it to the gracious permission of the Fishmongers' Company that they were allowed to dine in that hall. He would therefore like to express the appreciation of the Institute of the kindness of the Company.

The Rt. Hon. the Lord Mayor, in responding for "The Guests," said he thanked Mr. Waterhouse for what he had said, although they had all been reminded of some of their weaknesses. They had been told that when a man gets too old for any other occupation he is allowed to make after-dinner speeches. Now it was his privilege to make many after-dinner speeches. Mr. Waterhouse had, however, forgotten in saying that this was the sole occupation for the aged there was another possibility for them, and that was the lethal chamber. He was sure that the guests would be very much honoured at the opportunity afforded of standing shoulder to shoulder with the great professional men who belong to this Institute. Allusion had been made to a profit of 100 per cent. from guests. He, as a representative, employed many architects, but he hoped that they would be so certain of giving full value for any miserable pittance they might receive it would be recorded of them that they worked for the love of their art and not in the expectation of any sordid gain. In conclusion, he would express the sincere gratitude of the guests for the great privilege afforded the mere man in the street of being permitted to come into the citadel of architectural learning and for a few hours at any rate to be permitted to sit at the feet of architects and to learn of their art.

His Grace the Lord Archbishop of Westminster said he was greatly honoured to be associated in the toast with the Lord Mayor. The latter had replied mainly on the part of those who approach architecture from the civic standpoint. When he himself came into contact with the architectural world it was necessarily from the ecclesiastical side. On that account the Institute had given proof of very great magnanimity in inviting him to be their guest. The greater part of his work consisted in trying to set up ecclesiastical buildings of the simplest possible character at the least possible expense. He had found that generally his first interview with one or other of the many architects with whom he could claim friendship was the most pleasurable one for both sides. He entertained great hopes, and the architect did likewise, of what they were going to accomplish. But later on the architect had to reconcile his art with a very exiguous purse. But he (the speaker) could never forget that he was at Westminster living continually under the shadow of a very masterpiece of modern architectural skill. And on that account, if at times he was bound to curb artistic aspirations, architects would understand he could never be ungrateful to the members of their profession. Perhaps he might be allowed to say that, after all, it is the Christian Church which has offered to architects the highest opportunities of exercising their skill, and they have done more than anyone to add dignity and beauty to Divine worship. They would permit him, in expressing a wish for their success in every department, to hope they would never fail to find in religion their highest source of inspiration.

During the dinner a programme of instrumental music was gone through by Herr Gottlieb's Vienna Orchestra.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has issued a special manufacturing building number, which contains a large number of views, plans, and other geometrical drawings, including constructive details of a variety of factory buildings recently erected in the United States. A complete series of views is also given of St. Paul's Cathedral, Detroit, of which Messrs. Cram, Goodhue & Ferguson are the architects.

Berliner Architekturwelt (Berlin) illustrates fully the new Real-gymnasium at Mariendorf, of which Herren Reinhardt & Süssenguth are the architects; and also that at Gross-Lichterfelde by Herr Ammer. Plans, views, and details are given of a large office building, the Fuggerhaus, in the Königin Augusta Strasse, Berlin, by Herren Leschnitzen & Lipp, and some country houses are also illustrated.

La Construction Moderne (Paris) gives some good general views and details of the Victor Emmanuel monument at Rome, with a scathing criticism by Alfredo Melani on its design as executed.

Deutsche Bauzeitung (Berlin) has in recent issues fully illustrated the great building erected to provide lecture rooms for the University of Hamburg, from the designs of Herren H. Distel & A. Grubitz.

Het Huis (Amsterdam) has a continuation of the article on the castle of Doornenburg, and also the conclusion of that on old tobacco-boxes with engraved lids. The new building of the Amsterdam Bank in the Sarphatistraat is illustrated.

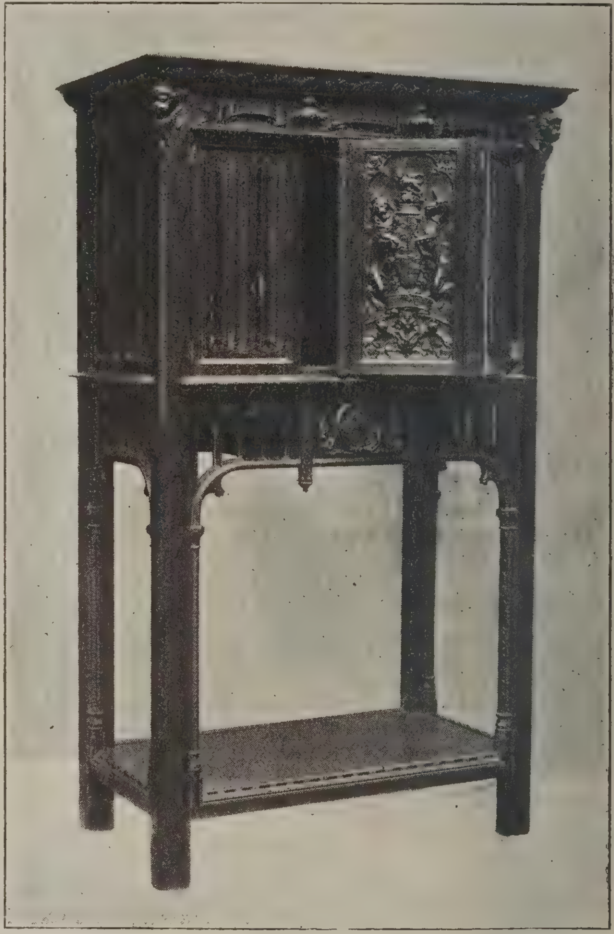
Il Monitore Tecnico (Milan) contains an illustrated description of a scheme by the engineer Daniele Donghi for connecting Venice and the Lido by a tramway tunnel under the lagoon.

Stone (New York) illustrates the entrance vestibule and main stairway of the New York Public Library and the upper central portion of the reredos at Christ Church Episcopal Cathedral, St. Louis, the latter the work of Harry Hems & Sons, of Exeter.

ILLUSTRATIONS.

DETAIL OF CARVED CABINET.

THE Armoire was designed by the headmaster and carved by the students of the school. The wood used is French walnut, and the design is carried out on the lines of the transitional Gothic of the "Francois Premier" period. The details are modern but treated somewhat severely in accordance with the style. The cabinet stands 4 feet 6 inches high and is 2 feet 9 inches wide, the upper portion forming a cupboard with a opening of 2 feet by 1 foot 4½ inches by 1 foot 7½ inches high. Beneath the centre of the cupboard is a drawer 8 inches by 5 inches by 15 inches deep. The Royal monogram is introduced in the carved panel on the front of this drawer. The door which forms the centre panel is richly carved with the Royal Arms, the Rose, the Thistle, and the Shamrock. On either side and at the sides of the cupboard are six panels ornamented with the linenfold pattern, with a very delicate line of carving down the centre of each. The three front panels are separated by small columns richly tooled and finished off with finials and pendants. The cupboard rests on three arches and bands of pierced tracery. These arches are supported by small shafts with caps and bases, they are octagonal in section and covered with delicately tooled ornament. The whole is surmounted by a cornice consisting of a convex moulding pierced and carved with roses and foliage and a frieze on which is carved an inscribed Garter. At the two angles are winged cherubs' heads carved out of the angle posts.



Carved Cabinet presented to their Majesties the King and Queen as a Coronation Gift by the School of Art Wood Carving.

The following letter has been received by the Secretary of the School of Art Wood Carving in acknowledgment of the presentation:—

Buckingham Palace:
June 17, 1911.

Dear Sir,—The King and Queen command me to convey the expression of their sincere thanks to all those students, past and present, who have joined in offering to their Majesties on the occasion of the Coronation the cabinet designed and carved by the staff and themselves. The King and Queen are delighted both with the design and execution of this beautiful present, and are very glad to possess the list of names of the donors, which is appended to the address that accompanied the gift.—Yours very faithfully,

ARTHUR BIGGE.

J. Saltmarsh, Esq., I.S.O.,
Secretary, School of Art Wood Carving.

MORDEN COLLEGE, BLACKHEATH.

THE measured drawings of this work of Sir Christopher Wren have been prepared by Mr. W. G. Allen, and are in further illustration of the article which appears on page 3.

SITTING ROOM IN MR. CHARD'S HOUSE (Plot 304).

FURNITURE AT GIDEA PARK.

THE promoters of the exhibition of houses and cottages at the Romford Garden Suburb were well advised in arranging a special award for internal fittings. There were in all seven classes in the competition: the first was for a detached house to cost £500; the second, for a detached cottage, to cost £375; and Class III. was for the best internally fitted cottage in either of the preceding classes. Most of the prizes have been already allotted, but the winner in Class III. has yet to be selected. Now, however, several of the houses are furnished by enterprising firms, and the visitor will find in them both instruction and interest.

Those of our readers who have not been to Gidea Park had an opportunity of obtaining an idea of some of the furniture in a previous article, with illustrations, dealing with the interiors of a few of the houses.* This week we show more photographs, and these are of rooms furnished by Oetzmann & Co., Ltd., Hampstead Road, W. Their exhibition is to be found in four houses, two of which are facing the golf links and the remaining two are in an adjacent part of the estate. To the visitor approaching the suburb from the station the first house to be entered is on plot No. 14 (Mr. T. Milwood Wilson, architect). It admirably exemplifies what can be done in the way of furnishing a sitting-room, a dining-room, and four bedrooms for about £250, with due regard for good taste and comfort. To some the chintzes in the sitting-room might seem not quite satisfactory, but that is obviously a matter for individual choice. In this house, as in the other three, commendable care has been taken to preserve the colour harmonies between the walls, the carpets, the hangings, and the coverings. Close to plot No. 14 is Mr. Michael Bunney's house on plot 16, of which we show the sitting-room. This is the most expensively furnished of the four, and totals about £300. There can be no possible doubt that it contains many pieces which would please the most exacting critic. The sitting-room is furnished, Messrs. Oetzmann say, partly in walnut and partly in oak of the Charles II. and William and Mary styles. This room goes from front to back of the house, and gives all the necessary space for a dignified arrangement of its contents. In certain of the other houses in the suburb the rooms are so small as to give a crowded effect when the furniture is brought in. Our second illustration is of the sitting-room of a house designed by Mr. T. Millwood Wilson for plot No. 226 (opposite the village green). It will be noticed that here there is a laudable restraint, which is continued throughout the house. The fourth and last house is in Risebridge Road, on plot No. 304 (Mr. Chard architect). This is particularly interesting by reason of its low cost. But the dining-room here shown will indicate that it is quite possible to retain dignity and taste in furniture even though the cost be under three figures. The sitting-room also illustrated possesses the same qualities.

It should be mentioned that in each case the furniture has been installed only after consultation with the architects. The exhibit is, of course, a business one, and so one may cordially approve of the clearly marked prices which are attached to most, if not all, of the contents of these four houses.

DINING ROOM IN MR. CHARD'S HOUSE (Plot 304).

THE SAFETY AND CONSTRUCTION OF BUILDINGS AT EARL'S COURT.

By BANISTER F. FLETCHER, F.R.I.B.A., F.S.I.

THE Exhibition at Earl's Court has for so long been an attraction to Londoners and visitors from the provinces and all parts of the world that there might seem to be little to say on the subject from an architectural point of view, but a visit to Earl's Court will convince anyone that considerable alterations and improvements have been carried out to make it more attractive to the public, and when it is remembered that about 3,000 men have been employed in effecting these changes for some time it will be readily understood that a good many novelties in the architecture have been executed.

The Earl's Court Exhibition, as reorganised and reconstructed by Mr. J. Calvin Brown, inevitably recalls those great international exhibitions which were held in Paris in 1889, in Chicago in 1893, and in St. Louis in 1904, for although not so large in area, it possesses many features which are due to American invention, and it further has the advantage of compactness, and in this respect the various attractions are, of course, more easily accessible to visitors. The various entrances have been provided with imposing open archways, which at once emphasise new management and reorganisation.

As an example of town planning, the arrangement of the buildings on the awkward site is indeed of great interest, and reflects great credit on Mr. A. O. Collard, F.R.I.B.A., who originally designed them, and who has been associated with a well-known American engineer (Mr. J. C. Biggs, of St. Louis) in their remodelling.

The Exhibition is, as it were, in fact, on three islands, separated not by water, but by railroads, and these are brought together with considerable ingenuity by wide bridges, some of which have been recently reconstructed so as to form one self-contained whole.

The irregularity of the site, indeed, gives to Earl's Court a considerable advantage over other Exhibitions, as it enables numerous entrances and exits to be formed on all sides, giving access to various lines of railways and omnibuses, and thus provides for the safety and convenience of the public by enabling it to easily gain the route required without crushing, crowding, and inconvenience. When one sees what takes place at the closing hour of some Exhibitions, the advantage of numerous exits cannot be too much insisted upon, for the exit to the buildings themselves is in reality a minor matter unless crushes are avoided at the turnstiles.

The risks of fire, too, appear to have been carefully studied, and the buildings have been treated with fire-resisting paint, which is approved by the London County Council, and the fire appliances have had to pass the severe tests imposed by Lieut. Sladen, of the London Fire Brigade. Where thin enclosures have been necessary, asbestos sheeting is used in preference to thin boarding, and in many cases steel takes the place of the wood studding which was formerly used in Exhibition buildings.

The Empress Hall, which is 315 feet long, and has a clear span of 220 feet (only 5 feet less than St. Pancras Station, which is the widest space in England roofed in a single span), is now used as a skating rink, and has been re-decorated inside and out, and remains one of the finest buildings in the Exhibition.

The Central Hall, which forms the centre of the Exhibition, being situated at the eastern end of the bridge over the West London Railway, has been re-arranged and made more convenient as a meeting-place and starting-point to various parts of the Exhibition.

Northwards of the Central Hall lies the Imperial Court in the Hindoo style of architecture, which is considerably altered from its former appearance, for the eastern side has been removed, and is occupied by the "Gravity" or "Coaster" ride. This is a structure of timber providing a railed track of 1,200 yards, along which the cars, provided with carefully-designed safety apparatus, run on graded curves after being started from a tower 50 feet above the ground. This structure, with its forest of pitch-pine timbers, is, we believe, the first of its kind in Europe, and possesses many improvements, which should make it popular, amongst which may be mentioned the "Jerk Saving" apparatus or clutch, the improved cars each seating four persons, the complete automatic signalling apparatus, improved wheels, and guide wheels and extra precautions in laying the track including the safety clutches every 3 feet apart.

Further northwards, the "Dragon Gorge," formed of tracks in a similar manner, is made to pass through scenery of various types for a distance of over a mile, the safety cars having a seating capacity for six people. The entrance is an amazing structure of steel and plaster. Near by is the West Kensington Station entrance, one of the four great exits which distribute the public at closing time, and thus minimises any inconvenient crushing.

Crossing the District Railway line by the newly-widened bridge, the forest of timbers forming the new "Tower Ride" is a conspicuous feature. This structure, raised well above the ground, is of stout timbers, the uprights being bolted together and supporting the horizontal timbers to which they are securely spiked with 6-inch spikes. In this, as in the other structures of the same type previously mentioned, the London County Council regulations require that the safety of the public should be adequately provided for, and, indeed, it must be the prime consideration for all amusement devices, for whereas railways and other public means of communication have perforce to be used by the public to get from place to place, people are not compelled to use "Gravitation Rides" and "Mountain Railways," and should not do so unless assured that every precaution is taken for their safety.

Returning by the Western Arcade to the Imperial Court, the Royal Galleries of which are now given up to the interesting Art Exhibition, we come to the bridge which crosses the West London Extension Railway and leads to the Queen's Hall. This has been rebuilt by the District Railway at an expense of £8,000. We find that in order to prevent crushing at this important point it has been widened considerably, and is formed of steel and concrete with asphalte floor, and is provided with a double "Escalator" or moving inclined stairway for those who like to glide up and down instead of using the adjacent staircases.

There are other novel structures, such as the "circular swing," "dragon slide," "waltzing swing," "mystic caves," "bridge of sighs," and many others, which offer new sensations without any danger to the most jaded visitor.

From a close inspection of the various buildings, I am of opinion that Mr. Calvin Brown, aided by his officials and experts, has done everything in his power to provide for the safety, comfort, and convenience of his clientèle, and that the various novel attractions already mentioned and the exhibition of very valuable ancient art, collected with much trouble from all quarters of the globe, should make the Earl's Court Exhibition a place for relaxation and interest during the coming months.

ART AND ITS INFLUENCE UPON DAILY LIFE.

By P. Walton Harrison, M.S.A., P.A.S.I.

Amidst the more evident allurements of modern life the many ways in which the arts serve for pleasure and profit, how they embellish the house and bring joy to the home, how they refine daily life and add grace and finish to individual character, are sometimes overlooked.

This subject may be dealt with under two heads; the one outward, the other inward. The one dealing with houses and tenements, with furniture, decoration, pictures, dress, and other visible and tangible objects of beauty. This is the concrete, the actual branch of the subject; while the converse side concerns conditions of mind, desires of imagination, taste, and the sense of the beautiful. This is the abstract, the mental, and what may be called the æsthetic phase.

To picture one side exclusively would be to present only one-half of the subject; whilst to combine the two into a whole brings into view the arts as they exist in the world bodily and as they affect man mentally. The inborn love of beauty begets art, and then again art, when brought into daily life feeds the finer faculties of the mind. Art is a pervading atmosphere which colours common things, giving, as Lord Bacon says of poesy, "Some shadow of satisfaction to the mind of man in those points wherein the nature of things doth deny it, the world being in proportion inferior to the soul."

The end to strive for is, to raise life to the level of art, not to sink art to the level of the common world.

A man's home is something more than a protection against the elements; in fact his house in relation to his life may be compared in some sort to the connection between body and soul. The analogies are many; indeed the windows of a dwelling have been sometimes likened to the outlooking senses, the eyes being as the windows of the mind. And next in importance to the health and comeliness of the fleshy tabernacles we inhabit, are the houses we make our homes—their light, air, and beauty; the colours, forms and ornaments that growing into daily life percolate the thoughts and flow into the current of the domestic affections. One reason why a man is seldom quite comfortable in lodgings is that the surroundings are foreign to himself; hence the endeavour to make his house in some good degree an integral part of his life.

It has been aptly said that "a house is in a certain sense an outer garment, which should bear the impress of the owner's peculiarities"; and it may be further observed that as a single dwelling represents an individual, so does a collective style of construction and decoration correspond to a race, a nation, or a period. A historic style, whether it be exemplified by a temple, church, palace, or ordinary private house, is an accumulative growth. In domestic architecture the first germ may be said to be a chamber or room, a shelter from the elements, which as barbarism passes into civilisation gradually grows; and so in the course of time have been matured the Greek and Roman houses, the Italian villa, the French château, the German schloss, the English castle and manor house. Each type in turn was moulded on the actual life, and having served its end, was succeeded by a new form accommodated to changed circumstances. Moreover, these historic styles and architectural structures have risen in the presence of nature—that nature which in its beauty colours the mind of man; they reflect conditions of climate, they make provision for summer's heat and winter's cold, they respond to the daily wants of great families of mankind, they embody an idea and satisfy a desire. And thus these forms and decorations become more living than inanimate stone; they are vital as organic tissues, they share a growth with nature and a grace with the human figure and flowing draperies.

It is important here to endeavour to indicate how the manifold phases of art, which in these latter days have grown complex and perplexing, had at first a simple origin in the forms of nature and in the wants of man; how they stand as tangible effects of more or less ascertainable causes, and accordingly are appreciable to reason and common-sense. This line of thought invites to further study.

Domestic architecture in England sprang out of a social state of the people. The arrangements were once feudal and servile, but at length the local arts, like the national laws, wrested as it were a Magna Charta of liberty. In mediæval times the distinctive feature was the dining-hall, but after the 15th century expanded into importance dormitories and other chambers, including the ladies' "withdrawing room." These structural changes were made to meet the advance in the social and moral condition of the English nation, the object being to minister to the convenience, comfort, and privacy of domestic life. "Side by side with the gradual development of the civilisation, wealth, and power of England, grew the domestic habitations of the country, in each age reflecting not only the manners and customs of the people, but the position and prosperity of the English as a nation; each progressive step in the gradual development of the style and plan being but an illustration to a page of history."

Whether Great Britain possesses any one style that can be called expressly national is doubtful, and yet beyond question our structural and decorative arts have grown out of and respond to our national life. Our laws are said to be the perfection of reason, and our arts, though not very ideal, are little short of perfect in their adaptation to practical ends, and are the heritage of our people. Of the Englishman's house, the boast has been made that though the winds of heaven may blow through it, the king cannot enter. Against our political constitution the fault has been found that it holds so loosely together that a carriage and four can be driven between its clauses, and yet it works well. And so with the domestic economy of our art; it may be wanting in symmetry and consistency, and yet it keeps out weather and ensures comfort.

Architecture is the parent art whence all the auxiliary arts spring. The reason of this is obvious, not only because a structure must be raised before it can be decorated, but also because the conditions of man and the surroundings of nature which mould the architecture act with equivalent forces on all subsidiary creations. Hence sculpture and painting, born as twin brothers, acknowledge architecture as a parent entitled to govern and to guide.

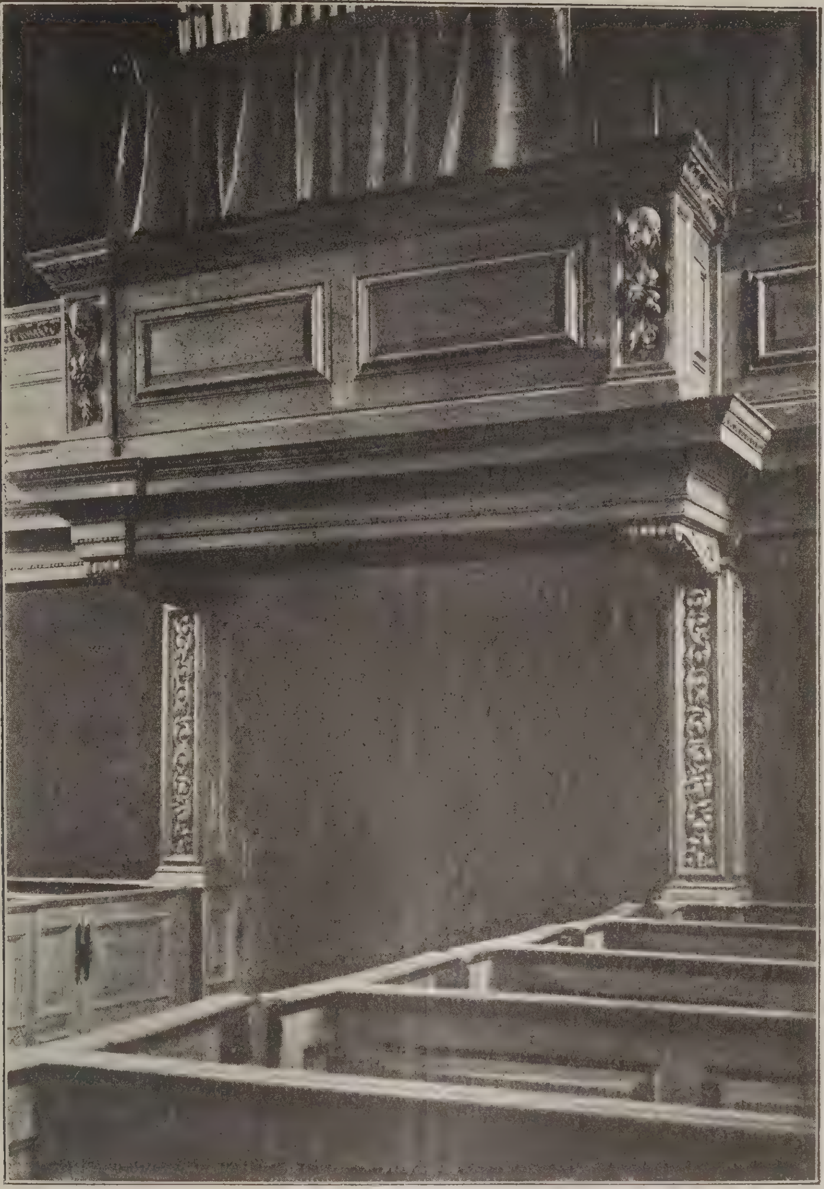
Kindred, if not identical, principles of construction, composition, and ornament prescribe the style of a building, of a statue and wall decoration; like laws regulate the form of a stone facade, of a wood cabinet, of a wall-painting, and a woollen carpet. I do not wish to under-rate the difficulty an unprofessional person may find in mastering these principles with their practical applications. But it may be well to recognise that without some knowledge a householder's judgment must be almost worthless; that wanting the first rudiments he will fall a victim to blind caprice and unreasoning fashion. Such misadventures, which have brought upon the arts in all their aspects incalculable evils, may, I think, in great part be averted even by the most elementary tuition. Art education, fortunately, becomes day by day more widely extended; and casting aside what is false and meaningless, people are taught to revert to a simplicity akin to nature and appreciable to clear reason and common-sense. Nor is it hard to gain a sound groundwork by aid of the plain and practical books which treat of the orders of architecture and the principles of design and decoration; and such teachings may receive pleasant illustration by visits to public museums and schools wherein national styles and chronological developments are exemplified by leading historic examples.

What is the style, Italian, Gothic, or otherwise, which an Englishman may best select for his dwelling? In the majority of cases this is decided for him, and not by him. In a city, at all events, the chances are that he will have to content himself with "the common square house" which he must make the best of. But, of course, the ideal condition

MORDEN COLLEGE.—THE CHAPEL.

is that a man possessed of some modest independence shall begin at the beginning, and first construct the house which he will afterwards proceed to decorate and furnish. Thus in due course the inside grows in harmony with the outside, all is of one type and pattern, and will turn out a consistent and complete work of art. This I have known done successfully—of course under professional advice, for I need scarcely say that the man who acts as his own architect has a fool for his client. Happily it is not difficult in the present day to find a well-trained and trustworthy adviser. Now, as in the best epochs, the divisions are broken down between high and low, great and small; the artist is not above industries, while the artisan is raised by legitimate aspirations. Art, as Thomas Carlyle says of poetry, "is the attempt which man makes to render his life harmonious." Very welcome is the close fellowship that has sprung up among skilled labourers. We may possess no "Gardens of the Medici," but we have at least the Schools of South Kensington. And throughout the country in the same Government institutions are seen studying together the architect, the sculptor, the painter, and the art workman. And it is no slight gain that among the pupils may be counted the sons of capitalists and of private gentlemen. Nothing, it is well known, tended more in the immediate past to the degradation of the arts than the ignorance and false taste of the middle and the higher classes; but now when art culture, at least in its rudiments, is possessed by all conditions in life, professional men may, with advantage, take counsel with patrons and connoisseurs. Such relations between employers and employed have in the best times led to salutary results. The hope would not seem unreasonable that the architect and decorator may be incited to rarer beauty and subtler utility by the well-to-do, well-read, and widely-travelled Englishman, who not unreasonably requires that his house in its plan and appointments shall minister to his highly-wrought sensibilities. It is through such reciprocities that the domestic arts have ever blended with the habit and complexion of the times, and it is yet possible that new and improved adaptations may follow, when the artist shall find equivalent expression for the better thought of man and the higher phases of life.

Never were the facilities greater for bringing domestic surroundings into keeping with the mind's imaginings. The sage advice has indeed been given to "leave the goodly fabrics of houses meant for beauty only to the enchanted palaces of the poets who build them with small cost." But fortunately "the thing of beauty" is not costly in proportion to the joy it brings, and while the necessaries of life have grown year by year dearer, elegancies, and even luxuries, have come within the reach of moderate means. It may be observed that there are typical characters which appear to fit typical houses; on the other hand, incongruities sometimes arise between tenants and tenements. It may readily be conjectured that there exist certain angular, serrated individuals to whom gable ends, barge-boards, and cork-screw chimneys prove most congenial; while there are others of symmetric proportion, balanced thought, and finished manner, who might feel most at home with a geometric and ideal villa as designed by Palladio and Sansovino. What is greatly to be desired is, that art shall express character of some sort, for in these days, especially in city life, the bane has been that houses, like their inhabitants, are characterless. Artists, however, of late years, both at home and abroad, have set a good example; they have raised habitations which are as picturesque as their own manners are un-



MORDEN COLLEGE.—THE ORGAN GALLERY IN THE CHAPEL.

conventional. Studios are naturally built and adorned in response to the arts they shelter—quiet retreats secluded from the busy world in gardens among shadowy trees, or shut off from noisy city life by tapestries, and otherwise far removed from senseless fashion by old treasures, painted glass, cabinets, carvings, costumes, and embroiderings which transport the fancy to periods historic and picturesque. A studio fitly reflects the style of an artist's composition; a library, in like manner, echoes an author's thoughts, and each will generally be found to yield material for a picture. Indeed, scarcely any better test can be made of the skilfulness, or otherwise, of any structure or decoration than by asking the simple question, "Will it compose well; will it add beauty to the landscape; will the whole arrangement make a pleasing picture?" Many such paintings live within the memory. Take as example Lord Lytton and Charles Dickens, each seated among books in his library; or again, the studios of great artists surrounded by the works their genius has called into being.

Each man, though but a small unit in a large world, impresses his mind indelibly on his home, and something more than idle curiosity leads a traveller to search out the haunts and habitations of Coleridge, Wordsworth, and Shakespeare. Matter impressed by mind becomes art.

The reverence for antiquity, the love for what is old, has made our century a period of revivals. And there is a reason under the law of reaction why men suffering from the pressure, the turmoil, the perpetual motion of modern civilisation, should seek refuge in the tranquil and poetic past. Young men rush to the city, while older men have retired to the country, only too happy if amid the beauties of nature could be found repose in

. . . . "an English home—where twilight pour'd
On dewy pastures, dewy trees,
Softer than sleep—all things in order stored
A haunt of ancient peace."

The country seats of old England gave place to Palladian villas, not of native growth, but exotics transplanted from abroad. Then ended for a time, at any rate, the national type, and houses were raised for pride and ostentation. The successive architectural styles, often named from the reigning sovereign, which took root in British soil, were, it must be confessed, far from legitimate in descent; the Elizabethan was followed by the Jacobean, and in due course came Queen Anne and the Georgian. Nothing can be more melancholy than the degradation and corruption into which the arts had fallen, when at last the notion happily seems to have occurred that it might be well to revive the old styles in their purity. Hence the resuscitation of the Gothic, not only for ecclesiastical but for secular uses; a revival which, notwithstanding some extravagances and follies, brings to our English homes manifold forms of fantasy and beauty. Since have followed other phases, and one of the latest and most favoured of ideas is that the Queen Anne style, though somewhat mongrel, bids best for the art of the future. These several revivals have the advantage of being sustained by research. And so critical has been the study of historic masterpieces that the care-taking revivals of Classic, Gothic, or Renaissance types reproduce the style, purged from late corruptions, in the chastity of the best period. Thus there is good ground to hope that shams have had their day; indeed, there cannot be a doubt but that the domestic arts have gained greatly in purity, simplicity and truth. The time has now come when art permeates all conditions of society, ministering to the luxuries of the rich as well as to the necessities of the poor. The aim should be in all our works to approach the completeness and fitness which mark the more perfect ways of creation, making our homes, the furniture of our houses, the clothes of our bodies part of that large economy in which uses intermingle with beauties.

THE TESTING OF PAINT AND VARNISH.

THE following is the conclusion of Mr. W. F. Nicholson's paper read before the Paint and Varnish Society on June 15, and is continued from our two previous issues:—

Cracking.—That is, very fine cracks, extending in all directions. This is often due to the varnish being applied in very cold weather, or in weather with cold snaps. Another frequent cause of this is the addition of too much gold size or terebine. A painter will often add terebine to his varnish to enable him to get off the job quicker, and especially in bad weather, when he has to do the work during the fine spells. The powerful dryer causes the varnish to set too hard and destroys the elasticity, so that the varnish cannot expand and contract with the varying weather it has to encounter. Cracking is often due to the inferior preparation of the work over which the varnish is used, especially in beer graining and groundwork that contains too much oil, or in which terebine has been used. When too much oil has been used in the undercoat, it prevents the work hardening sufficiently so that when the varnish is applied and dries it draws the paint up, thus causing cracks. When too much terebine is used it has just the opposite effect, *viz.*, it causes the undercoat to dry too hard, so that when the elastic varnish expands with the heat of the sun the paint will not correspondingly expand, thus causing cracks.

A practical man can usually tell whether the fault lies with the varnish or the paint underneath. If the fault of the varnish, the work underneath is usually undamaged, but if, on the other hand, the fault lies with the undercoat, the cracks extend right to the woodwork underneath. Again, in graining work, if the cracks extend in all directions, it is usually the varnish that is at fault, but if the cracks follow the graining, then the fault is with the undercoat.

Blooming.—This is one of the most serious difficulties that manufacturers and users of varnishes have to contend with. However well made and however good the quality of a varnish, there is still the likelihood of blooming. Blooming is a peculiar white, cloudy, and lustreless appearance which shows itself either in patches or over the whole surface coated with the varnish. The fault may be with the varnish itself, or may be caused through conditions arising at the time of application. If this fault be due to the varnish itself, it is caused usually through insufficient running of the gum, so that all the moisture is not expelled, and it also sometimes happens through using of varnish that is in too new a condition. If caused through conditions arising when the varnish is being used, it is usually that there has been a draught which has caught the varnish, or that the work over which the varnish is being used is damp. This bloom, as a rule, can easily be wiped off with a soft cloth, but will usually re-occur. The most satisfactory manner to deal with blooming is, in my opinion, to wash the work over with a solution of vinegar and water, about half a pint of vinegar to a pail of water. Then, if the work is rubbed up again with a washleather, it is generally found that the bloom has disappeared entirely.

It sometimes happens that a painter will leave his varnishes exposed to the air for some time, by leaving the bung out of the can. He then finds that the varnish has thickened too much to use. He will often then add some turpentine to thin it down again, and is very surprised when he has used the varnish to find that it dries patchy—that is, the varnish dries in patches, some dead and others glossy, and as often as not blames the varnish. It should be well known that turpentine will not properly amalgamate with varnish cold, even if they can be well shaken up; on being left, it will be found that some of the turps has risen to the top. To thin the varnish properly it requires to be heated, and even then it is not safe to use the varnish so treated on good work. The same will apply when terebine or other liquid dryers is added to varnish, and if a painter does do this, he should do so at his own risk, and not blame the manufacturer if the work does not turn out satisfactory.

Sometimes varnish will be found to crawl into blotches—that is, it looks like small-pox marks. This is due to one of two causes. First, that it is applied over a dirty, greasy surface, or, secondly, that it is applied on a surface that has already been varnished and has not been rubbed down. Varnish will not take well over a glazed surface.

Varnishes made from cheap, low-grade gums and resin are rather liable to perish. The same thing happens by the use of too much driers in making the varnish. Exposure to gases, especially vapour of ammonia, or to heat before the varnish is dry, is liable to induce the varnish to perish.

Whenever any such faults occur in varnish work the varnisher should make particular inquiry into all the conditions surrounding the work before proceeding to form an opinion as to the exact cause, and at once throwing the blame on the varnish. First, he should have regard to climatic conditions; then, to the place and circumstances surrounding the work, whether subject to draughts, too much heat, vapour, &c.; to the condition of the work itself; and the care with which the varnish has been applied.

Many decorators have the opinion that anyone can use and apply varnish, and often put a casual painter or labourer on to do the work. This is a great mistake. To varnish work well it requires a skilled workman, and should not be undertaken by anyone who has not had plenty of practice.

In using varnish, several points should be carefully seen to. First and foremost, to see that the work is thoroughly clean and dry, also free from grease, pumice dust and dirt. Secondly, to see that the brush is quite clean and dry. Do not use a brush that has been kept in paraffin, as paraffin is greasy and will spoil the work. Thirdly, to see that the atmospheric influences are the best possible. Fourthly, to see that the varnish is not too thick, as this is as bad as using it too thin; both will cause it to run, the former will appear to hang in festoons. And lastly, to see that the varnish to be used is the right sort for the work. For outside work an elastic varnish should always be used.

Now as to the best tests for varnish. The best and most reliable test for a varnish, and one which I would recommend all consumers of varnish to use before taking the bulk into use, is:—Paint a board with a good coach colour, allow it to get properly hard, then apply the varnish to be tested, taking care that a clean brush is used. Then hang the board in an exposed position, and watch the results.

This method takes time, which cannot always be spared or given to the test. If it is desired to arrive at a knowledge of the durability under wear of a varnish sooner than it would take under ordinary conditions, take a sheet of glass and paint it with a coat of body colour. If there are several varnishes to try, space off the surface into as many spaces as there are varnishes. Then with a clean brush for each proceed to apply by accurate measurement each varnish to the space allotted, and when dry expose it to the weather on a flat surface, on which some gravel has been placed, or on a skylight, laying it flat with the varnish side up. Weeks will determine in this case what would take months otherwise. Inside varnish can be tried by pouring some on a piece of glass and exposing it to the light in a room or workshop.

If I may, in conclusion, be allowed, as a manufacturer, to give a piece of advice to users of varnish, it is this:—Always use a good varnish. It is far cheaper in the end, besides going further; it gives satisfaction to you and your customer, thus obtaining repeat orders; whereas cheap varnishes, which look well perhaps when first put on, soon lose their lustre and more often than not crack and blister, and do not give satisfaction to you or anyone else. I have often been met with this remark when I have endeavoured to impress this upon a customer: "It is all very well, but my work is so cut in price that I cannot afford to use a good varnish." My reply is this: After all, the cost of your material is very small in proportion to the cost of labour, and what you gain on the cost of your varnish you lose in labour, because a cheap varnish as a rule takes longer to apply, it not flowing as easily as the better-class article and does not go as far, besides which, your customer is not pleased, which, after all, is the chief consideration. Anyone who studies the market must know that cheap varnishes cannot contain pure ingredients, and as a rule it can be taken for granted that when the price is reduced the quality is reduced to meet it.

I now ask you to comment upon and to criticise this paper, as it is only by hearing one another's views that a correct judgment can possibly be obtained upon the subjects I have spoken on, every manufacturer having, I suppose, a slightly different view according to how he has studied the subject.

Mr. T. A. Davidson thought the author did well in advising the practical painter to test his paints and varnishes by practical methods rather than to apply the methods of chemistry, as chemical methods required an amount of knowledge not usually to be found in the painter and decorator. While a painter and decorator might be able to achieve results fairly well, those results had to be interpreted correctly, and for that purpose very special knowledge was required. He had been interested to hear the remarks about good varnishes being made containing resin and Chinese wood oil; he believed such varnishes could be made, and under those circumstances he did not see why varnishes made from the more expensive resins should be held in higher esteem, unless they were capable of accomplishing better work than the cheaper varnishes. The question of "bloom" on varnish was perennially cropping up. He doubted very much whether anybody really knew what were the causes of "bloom." It was well known that varnish in drying during exposure to the weather, especially under conditions of moisture, exhibited the blemish, and in his experience there was more than one type of "bloom," and one of them, he thought, was due to the oxidation of oil in the varnish. Some varnishes were subject to blooming more readily than others, owing to the nature of their composition. With regard to the blooming due to natural oxidation, a good deal of it would be removed by washing, and it was on that account that carriages and coaches were so frequently washed, simply to keep the appearance of the varnished surface up to its best. He would emphasise that greater attention should be paid to the physical testing of paints and varnishes rather than to the chemical testing, for after all they had to do certain work, any if they would not do that work, no matter how pure they were, they were useless for the purpose. With regard to the reference in the paper to a chemist directing a painter's work and the antithesis, the chemist being directed by the painter, he could only say that in the latter case he should have a great deal of pity for the chemist.

Mr. J. **Cruickshank Smith** said there were many points in the paper on which he differed entirely from the author. At the outset, the author mentioned that, in his opinion, the painter's aspect of testing paints and varnishes might not be interesting to the manufacturer. He himself thought the reverse was the case. Nowadays manufacturers welcomed every addition to their knowledge, provided it came from really practical men, and he should like to have heard some practical painters express their opinion on the view the author had put forward. Manufacturers really did welcome painters' criticisms, and were open at all times to hear really practical remarks from users. It occurred to him that the term "testing of paints and varnishes" was liable to a good deal of misconception. The questions arose as to who was going to do the testing, and for what purpose the testing was to be done. If the testing was to be done by a professional analyst—and in that case it might be called an analysis—it gave quite different information from that which would be obtained from a painter practically examining things. He therefore drew a distinction between scientific analysis and what might be called the practical valuation of paints and varnishes. There were no men more competent than the practical users of such materials to give an opinion as to the practical value of the products; but to expect a painter to labour through the processes mentioned by the author was expecting an impossibility. Painters who attempted to follow the brief outlines given by the author would be exceedingly badly advised, because he was quite certain they would not get good results, and would probably be misled and a good deal of trouble would be caused to everyone concerned. With regard to the test in connection with the burning of oil from white lead, anyone who had the slightest smattering of chemical knowledge would never attempt, or recommend his employees to attempt, that burning off of the oil. He once came across a painter who had formed the opinion that he was using adulterated white lead, and he was endeavouring most laboriously and conscientiously to obtain some sort of result by burning the white lead in a ladle, and he mentioned that he always tested his lead in that way. He took a ground white lead of a certain weight, burned it over a coke fire, and weighed the residue, and if he obtained a certain amount he knew the lead was pure, and if not, that it was adulterated. Such information was useless. Technical testing should be left entirely to the professional chemist, because the painter attempting it would be sure to make a mess of it. With reference to oxide of zinc in the form of paint working very heavily, that did occur sometimes, but it was not necessarily so. Oxide of zinc could be ground in such a manner as to work quite freely. Modern manufacturers did not always use linseed oil in grinding oxide of zinc, but used other materials, which had the property of counteracting that physical effect. As to barytes, it was often a useful, but more often a very dangerous friend. He had understood the author to say rather emphatically that a great deal of white lead was adulterated; but he was inclined to dispute that, and if by adulteration was meant wilful sophistication, he certainly disputed it. If the author, however, simply meant that a good deal of composite paint was made nowadays, paint containing one or two pigments in a blend, it was quite true, because people had found that such a blend, properly amalgamated, gave better results than one pigment. He thought he had understood the author to say that in tinting red paint vermilionette was used, but if vermilionette was used for tinting red paint that paint would soon lose its colour. He wished to ask the author for some further information as to the action of electricity in promoting pinholes in paint, because it was an interesting point. He thought the Society was indebted to the author for putting forward the groundwork for a very wide discussion.

Mr. J. G. **McIntosh** said that with regard to tests made by painters, in the first place, the painter could not apply the tests, and, in the second place, a great many of them were totally unreliable. For instance, in regard to white lead, the author mentioned alcohol. That was one of the things he himself had been writing about for the last thirty years; it was impossible to separate the lead by sulphuric acid and alcohol; it had to be precipitated by sulphuretted hydrogen as sulphide. The testing of linseed oil with nitric acid was just as bad as burning it off. With regard to zinc oxide and white lead making a very good paint when mixed together, he quite endorsed the author's views on that matter; but he could not endorse what was said about barytes. The barytes was nothing more nor less than a makeweight, and the manufacturer who tried to educate the painter into the belief that barytes was anything more than a makeweight was on the wrong tack. He objected altogether to the manufacturer educating the painter. With regard to Chinese wood oil, the first thing that appeared about it in the English technical press was that it was used to a great extent on the Continent; but the Continental press mentioned that it was used to a large extent in England. If Chinese wood oil was to be used as a vehicle for the introduction of resin into paint, the less it was used the better.

Mr. A. S. **Jennings** had rather hoped the author would have given detailed information as to how a paint should go through a service test, because it seemed to him that was the only way to ascertain the value of a paint. The value was principally its protective value, and it was necessary to ascertain how the paint would last, and he thought there was no way of doing that except by actually exposing the paint to the atmosphere. A series of tests had been conducted in America on that plan. There were various mixtures of different pigments, pure white lead, a proportion of two-thirds of white lead, and one-third of zinc oxide, and so on, barytes, lithopone, and coloured paints. The mixtures were painted on a board and exposed to the air, and periodically reported upon a committee of painters. It seemed to him that if the Society could do something in that way it would be doing very valuable work. He thought it would be then found that the claims made for white lead were not altogether deserved, that it was not the beginning and end of paint. It would be necessary to carry out the work under the supervision of a chemist in order to obtain uniformity. A painter even with the greatest care was likely to forget that exactitude in such matters was very essential. It would be also essential to vary the thinners according to the material; for instance, one would not use the same paint on cement as on iron or wood. Also, different woods would require different mixtures, a hard wood needing something different from a soft wood. The National Association of Master House Painters and Decorators took the subject up two years ago, but they had only gone a little way, and he hoped they would continue to develop the subject, because he felt quite certain it would give much more valuable information than chemistry. Chemistry was exceedingly valuable to the manufacturer, but, as the author justly said, it was practically useless to the painter who wanted to know what a paint would do, not what it consisted of. He thought the author had made a little slip in connection with the adulteration of white lead. It was perfectly true there were on the market a number of leads which were termed "reduced," but the word "reduced" had nothing whatever to do with the Adulteration Acts. It was brought forward by the London Chamber of Commerce White Lead Section, whose action resulted in every dealer and manufacturer of white lead placing upon the package the word "reduced" when the white lead was not genuine or pure. Sometimes "No. 1" or "No. 2" was used instead. The trouble was that one manufacturer's

"No. 1" did not contain the amount of barytes as another manufacturer's "No. 1." Some uniformity in that respect would be a great help. He also thought the author was mistaken in thinking that zinc white was often adulterated. There were some zinc oxides on the market which contained a little lead, but as a rule zinc oxide was not adulterated. It was very unfortunate that the word "zinc white" was used as applying both to zinc oxide and to lithopone—two totally different materials.

The Chairman said the Society was greatly indebted to the author for his paper, which was full of useful information. From the point of view of those who used paints and varnishes there was much value in it. The testing of paints and varnishes on the part of the paint-users was more or less mechanical. There might be a number of people in the decorating trade who expected to get a first-class article at a fifth-rate price, but they did not get it, and the author had brought out that particular point. Those firms with a reputation to keep up were the firms to which the best decorators went because they knew they could rely upon having a good article at a moderate price. The tests made by users were more or less of a rough and ready character, chiefly mechanical, but they sufficed to show whether the standard was being kept up, and to keep a check on the manufacturer. The user generally had a standard set of colours, and compared the paints against those standard colours by means of weights and scales. The judging was not exact, but was sufficient for the purpose. If a man came and offered an article at 15*s*. a cwt. for which another firm wanted 35*s*., it was a mere question of proportion to find out if that 15*s*. article in comparison with the 35*s*. one was worth more than 3*s*. 6*d*. What the user looked for in colours chiefly was fineness of grinding. That helped to give a perfect paint and a paint easy of application, and also gave a solidity and finish to the paint work which could be obtained by no other means. The extra grinding was the cause of a good article costing money. There was no doubt also that the paint went further, and that, therefore, the best article was the cheapest. In testing for colours, the test would be directed to purity of tint and depth of staining power, and in the more or less transparent colours clearness of tint would be looked for. In connection with varnishes, the question of bloom was an ever recurrent one. He had had some most curious experiences in that matter. He would go on for a considerable time without the least trouble, and then, from the use of the same varnish, blooming would take place. From experience, spread over some twenty-five years, he had come to the conclusion that in most cases blooming was due to atmospheric influence. Where blooming took place the atmospheric influence was more or less of the same character, although the time of year was different; it was generally when a humid atmosphere had prevailed at the time of application of the varnish. The morning might be fine, but before the varnish had dried a moist afternoon might have occurred; nothing happened for a time, but a few weeks afterwards a bloom appeared. That bloom would recur over and over again when the weather was moist, but when the sun came out it often went away. He had had two or three instances of a door blooming regularly at such periods. On the other hand, there were cases which he could only assume must have been due to some defect in the manufacture of the varnish. He was agreeably surprised to hear from Mr. Cruickshank Smith a reference to white zinc. Most painters were now quite alive to the fact that it was not unlikely white lead was going to be barred; that would be no surprise, having regard to the commission sitting on white lead. Therefore, the question of substitutes was an important one. He did not think painters were conservative; they had used white lead because it was the best thing they could find. It led to very serious illnesses, and had been one of the causes for the rise in the rates of premium under the Employers' Liability Assurance Act. Painters would therefore like to drop white lead if possible, but equally good work had not hitherto been done with other pigments. He defied any manufacturer to use zinc white, as it had been manufactured up to the present, and make anything like a possible job, finishing with an enamel surface that would retain its lustre and would not crack or blemish in any way. He had been rather surprised with regard to the suitability of resin varnish. He did not care what varnishes were made from so long as they could be depended upon to give a reliable and satisfactory job. He had been always told, however, by representatives of manufacturers that there was not the least trace of resin in their varnishes, and had, therefore, been led to consider resin rather deleterious. With regard to vermilionette, he had not an ounce of it in his shop. What was known as vermilionette was the most unstable thing on the market. He rather wished the author had touched on red pigments, because he had had some extraordinary experience of them in the past, and most painters had had trouble. He should like to know some test which would show what reds were reliable, as the matter was a serious one very much to the front at the present time.

Mr. Nicholson, in reply, said the Society, as constituted, was a very difficult one to read a paper to, because of the different classes of members. There were certain things that a manufacturer could not mention. He, therefore, tried to strike a medium. Most of the tests he had given he thought would not be very troublesome to the majority of painters after a little study. He assured Mr. Davidson that a good many varnishes were now made from Chinese wood oil. He thought Mr. Cruickshank Smith had not quite caught something that he had said—namely, that manufacturers were quite aware of the necessity of employing a practical painter at their works in order to obtain practical results with their paints. With regard to the burning off of oil from white lead, it was not reliable, but it was given in a good many textbooks, and he had a case a short time ago in which he found it was still used. He was attending the Courts as a witness, and heard a chemist from the London County Council asked how he tested white lead, and his reply was that he tested with a blow-pipe. A good deal had been said against barytes. Several large public bodies in their specifications now stated that their colours should be ground with so much colour, so much barytes, and so much oil, so that it was being recognised that it was impossible to make paints without barytes. One of the largest users of such a specification was the Metropolitan Water Board. With regard to vermilionette, he did not mean to say that vermilionette was good for making red paint, but simply gave it as an illustration in the colouring of a white body. With reference to Mr. McIntosh's remarks, Mr. McIntosh was not a manufacturer, and did not look at things from a manufacturer's point of view. He thought Mr. Jennings had answered himself with regard to the drying of paint. The only method that could be properly used was the practical testing out of doors. With regard to adulteration, he had said distinctly in the paper that if by adulteration was meant the putting in of a cheaper article with intent to deceive the purchaser that was adulteration, but if it was simply reducing the quality it could not be called adulteration. It was a common thing for manufacturers to sell first, second, and third quality white lead, not with the intent to deceive, because if a man bought No. 1 white lead he knew he was not getting it pure. He agreed with Mr. Davidson that there were a number of cases of blooming which could not be explained at all.

On the proposition of the Chairman, a hearty vote of thanks was accorded to the lecturer for his excellent lecture.

Correspondence

Old-Time "Travellers' Rests."

Sir,—Some recent correspondence in your columns has drawn attention to "Travellers' Rests" to be found here and there in England. In London there exists a very interesting "rest" which countless hundreds of the floating population doubtless pass without bestowing a glance upon it.

And yet it is situated in such a thoroughfare as Piccadilly and at a position near the railings of the Green Park, not so near the corner as to prevent attracting attention by reason of personal anxiety as to effecting a safe crossing, and yet far enough removed from the shops, so that the more crowded nature of that portion of the thoroughfare offers no excuse for the neglect of attention paid to this "Rest."

No! doubtless the explanation is that it is not a work of art, a thing of beauty—it is purely utilitarian, and even its utility is more of the past than the present. For it is a "Porter's Rest"—a wooden slab some ten feet in length, supported on cast-iron pillars of mid-Victorian want of style, the height of the Rest being perhaps slightly over four feet. It bears a bronze inscription in bold lettering to this effect: "On the suggestion of R. A. Slaney, Esq., who for twenty-six years represented Shrewsbury in Parliament, this porter's rest was erected in 1861 by the Vestry of St. George's, Hanover Square, for the benefit of porters and others carrying burdens. As a relic of a past period in London's history it is hoped that the people will aid in its preservation."—Faithfully yours,

Percy L. Marks.

FORTHCOMING EVENTS.

Saturday, July 15.

Institution of Municipal Engineers : Annual Meeting of the Western District at Worcester. A paper by Mr. B. Wyand on "Municipal Engineering as a Profession."

Tuesday, July 18.

Northern Architectural Association : Annual Excursion at Wynyard Hall and Grounds.

Somersetshire Archæological and Natural History Society : Annual Meeting at Frome (three days).

Wednesday, July 19.

Institution of Municipal Engineers : Annual Meeting of the North-Western District at Manchester.

Friday, July 21.

Architectural Association : Annual Exhibition of Students' Work. Special Visitor, Mr. Frank Brangwyn, A.R.A. (Closes July 29.)

University College, London : Mr. Leonard Stokes, P.R.I.B.A., opens an exhibition of drawings and designs by the Students in the Department of Architecture. (Closes July 29.)

Saturday, July 22.

Society of Architects : Sketching Party's visit to Oxford.

Institution of Municipal Engineers : Annual Meeting of the Eastern District at Yarmouth.

ARCHITECTURE AT THE ROYAL ACADEMY.

THE President of the Royal Institute, Mr. Leonard Stokes, is represented by three drawings, two of them showing proposed additions to Downside School, near Bath, in a bird's-eye view (1,490) and a detail (1,497) of part of the quadrangle, with a characteristic tower of the type that Mr. Stokes knows so well and so effectively how to produce, and that other people try to follow with a conspicuous lack of success. The third drawing exhibited by Mr. Stokes is "The Oratory, Brompton : showing completion of St. Wilfrid's Hall" (1,678), a water-colour by Mr. Walcot. Mr. Lutyens has only one drawing in the Academy this year, "The Rand Regiment's War Memorial, Johannesburg" (1,492), in which the terraces and garden form part of the memorial as a setting to the arched central structure.

Amongst the many beautiful coloured drawings which are a feature of the Architectural Room this year, Mr. Albert Palser's "A pair of small houses" (1,704) is worthy of notice, and shows a clever composition from modest material. Another close by is "Staircase, 10 Carlton House Terrace, S.W." (1709), by Messrs. Detmar Blow & F. Billerey, a sumptuous piece of interior design.

Mr. J. Harold Gibbons, in his "Heathfield School, Ascot : proposed entrance gates" (1,548), shows in some nice pencil drawings a study of brick piers with vases, which are rather successful. Two different methods of design have been followed by Messrs. W. F. Unsworth, Son & Inigo Triggs; the one in "Rusper House, Horsham" (1,546), suggests a Sussex half timber and plaster house, with hung tile bay, which has by successive additions attained picturesqueness. The other, "A house in Kent" (1,555), appears to have been built in red brick, all at one time. "The Hermitage, Bedwellty, Mon." (1,552), by Mr. John N. R. Vining, is a curious essay in house planning, a Greek cross around an open court, which on the ground floor is cloistered. Hence the dining-room is styled the "refectory." Mr. Norman Evill's "House and stables at Silchester" (1,557), for A. S. Newnham-Davis, Esq., is a pleasantly picturesque, well-grouped composition in half timber, red brick, and tile.

If the requirements of business needed an addition to "The Lygon Arms, Broadway, Worcester" (1,572), that well-known hostelry could hardly have been treated with more strict regard to the real spirit of Broadway than has been done by Messrs. C. E. Bateman & G. H. Hunt. Mr. Edward J. May has had no easy task to deal with the site of "Webbington House, Somerset" (1,574), placed as it is on a steep hillside, but he has successfully accomplished the task as regards arrangement and composition.

It is pleasant to contemplate the possibility of our railway stations being in the future designed by architects instead of engineers when we look at "New buildings for Pinner and Harrow Stations, L. and N.W.R. Co." (1,582), by Mr. Gerald C. Horsley. We hope these may be the precursors of many more. In the "Proposed residence for University men in London" (1,581) Messrs. A. W. S. Cross & Alan E. Munby have produced a dignified example of English Renaissance, of the best type, breathing the spirit of Wren. The interior of a quadrangle is shown in red brick with stone dressings, a building of two storeys crowned by a mansard roof, which gives opportunity for a pediment.

Churches and houses form the larger majority of the buildings contained in the architectural section of the Royal Academy exhibition this year. Amongst the designs for public buildings some unsuccessful competitors for the National Museum of Wales appear, but in the form of perspectives of the exterior without plans, so that their presence on the Academy walls is no evidence that they ought to have received favour in the competition. Some of the Usher Hall designs also are exhibited, to which the same remarks apply.

In a different category are the drawings of "Glamorgan County Hall, Cathays Park, Cardiff" (1,668), by Messrs. E. V. Harris & T. A. Moodie, which show the front and rear of an actual building, the result of success in competition. The building is, though in no way a reflection of its neighbours, worthy of its position amongst the remarkable group of fine public buildings collected in Cathays Park, which promises to make Cardiff the most remarkable city in Great Britain in respect of modern architecture. Another public building of striking character is shown by Messrs. Gibson, Skipworth & Gordon's design for the new Guildhall, Westminster, of which a general perspective view (1,655) and a detail perspective of the entrance (1,660) are exhibited. As in many of Mr. Walcot's water-colour drawings of architecture there is in these a mysterious suggestion rather than definition of the features of the design.

Good examples of breadth in architecture may be seen in Mr. Charlie Castelow's drawing of "A country house, Well, Yorks" (1,662), and "House in Chelsea Vale" (1,653), by Messrs. Ralph Knott & E. S. Collins. The former is a stone-built house with mullioned windows, in which the ancient proportion of window to wall is characteristic of the period of English architecture on which the design is based; but in the latter we have an abnormal distance between the heads of windows on one floor and the sills of those above them, which is not at all in keeping with the traditional treatment of eighteenth century Chelsea, but assists in the attainment of breadth. There is quite a flavour of the modern L.C.C. architectural department about this design, which is not surprising.

The representation of old buildings in the Academy seems to be relegated to the Water-Colour and Black and

White Rooms. In the former we have a fine drawing by Mr. R. Phenè Spiers of a "View across nave of Great Hall, Karnac" (819). Other examples of architecture depicted in water-colour are "Sunny Palma" (855), by Mr. Tristram Ellis, in which the city dominated by the cathedral is viewed from the sea; "The Greek Theatre, Taormina" (878), by Mr. Alex. J. Mavrogordato, with the remains of the skene and grass-grown slopes of the auditorium; "The Giralda, Seville" (893), by Mr. Henry C. Brewer; "The enchanted castle" (922), by Sir Alfred East, A.R.A., a phantasy of Mont St. Michel; "The Church of St. Magnus, Lower Thames Street" (937), by Mr. W. Dacres Adams, a large detailed study of the arched footway; "St. Gilles, Caen" (987), by Mr. John Sowden, a detail of the Flamboyant lateral porch; "La Porte de Nevers, St. Valery-sur-Somme" (1,000), by Mr. George Ward, a riot of rich and broken colour of brick, stone, and slate; "The Rathaus portal, Rothenburg" (1,017), by Miss Madge Dawson, a study in green and purple; "Mariatheresien Strasse, Innsbruck" (1,026), by Mr. John Glynn; "A quaint corner: Caudebec, Normandy" (1,028), by Mr. Frank Holford; "Interior of San Vitale, Ravenna" (1,034), by Mr. Harold Sund; "Evening; the Rameseum, Luxor Egypt" (1,038), by Mr. Lancelot Crane; "Nevers, Porte du Groux" (1,039), by Mr. Charles Maundrell; "Venice," by Mr. Cyril A. Farey.

In the Black and White Room ancient architecture is delineated, mostly in etchings, by "St. Wulfran, Abbeville" (1,349), by Mr. William Ansell; "Church Lane, "Shepton Mallet," by Mr. Nathaniel Sparks; "Santa Maria del Sasso, Locarno," by Mr. Percival Gaskell; "Rue Damiette, Rouen" (1,376), by Gertrude Hayes (Mrs. A. K. Morgan); "The portals of Bourges Cathedral" (1,382), by Mr. Axel H. Haig; "St. Maclou, Rouen" (1,390), by Gertrude Hayes; "Saint Ouen, Pont Audemer" (1,396); and "Marché au Blé, Le Neubourg" (1,399), by Mr. Charles J. Watson; "Cour d'Albane, Rouen" (1,429), by Mr. William Ansell.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE drawings submitted for last month's subject of a piece of wrought-iron work executed prior to A.D. 1800 are of a generally satisfactory character.

Mr. F. J. Lenton has measured a pair of well-designed wrought-iron gates now at Berrystead House, Oundle, Northants, which, with the lead figures on the piers, were removed from Stoke Doyle manor. The date of the work is seventeenth century and shows the influence of Jean Tijou. Mr. Lenton's drawing is well executed in blue-black brush work, heightened by Chinese white.

Mr. T. Owen Thirtle has selected for measurement a small wrought-iron gate at the head of the staircase in the Guildhall, Norwich, which he has drawn to inch scale, with details half full-size. This is not a good scale for details, which should be either full size or not larger than one-third full size. Mr. Thirtle's drawing fails in the representation of leafage, and would be better if drawn in colour with a brush rather than in pencil with a flat tint.

"Le Quayt's" contribution is an elevation to inch scale in plain ink outline of the entrance gates to the Treasurer's House at York. This is eighteenth-century work and a good piece of design, to which our contributor's drawing hardly does justice. The curves are raggedly put in and the leafage not well expressed, whilst the shaky line fails to suggest antiquity, as is the evident intention.

"Plato" sends drawings of two gates, both at Enfield, Middlesex, one of which shows the curious quasi-Gothic affectation which is seen in some late eighteenth-century work and culminated in the efforts of Batty Langley. "Plato's" drawings are to inch scale with details half full-size, but being wholly in line, with scarcely a suspicion of shading, are not satisfactorily expressive.

Mr. H. A. Welch has given us a sheet of "measured notes taken from S.K. Museum, &c.," of a number of small pieces of wrought-iron work, English, French, and Italian, rather a heterogeneous and haphazard collection. The scale is an inch and a half to the foot, which is quite small enough for the size of the specimens selected, and the drawings wholly in pen-and-ink outline, which, as with other contributions, fails in the leafage.

"Sans Peur" sends a nicely-executed pencil drawing to inch scale, with a few details quarter full-size, of some beautiful gates at the Manor House, Jesmond.

Mr. E. H. Gibson has sent two drawings, to a large scale, not specified, of ironwork from churches in Leeds: a mace-rest from St. John's and a piece of chancel railing from Holy Trinity. With such large scale drawings, which are commendable, there should be given more information than is supplied by a pure elevation. The thickness of bars and the widths of straps have a vital influence on the design of wrought-iron work. The neglect of this fact has been somewhat general amongst our contributors, but is more noticeable with Mr. Gibson's drawing on account of the scale.

We have awarded a prize of one guinea to "Sans Peur" and half-a-guinea each to Mr. F. J. Lenton and Mr. E. H. Gibson.

This month's work closes the competition for our Travelling Studentship for the year, which has been won by Mr. A. E. Lowes, who has contributed under the motto "Sans Peur" very regularly from the commencement of the club, and whose work has during the last eighteen months shown marked improvement. Mr. Lowes has been run very close in the competition for the Studentship by "Le Quayt," who has also worked very consistently during the last twelve months.

NOTES AND COMMENTS.

The annual report of the Council of the Architects' Benevolent Society, which has recently been issued, is evidence of the good work that has been done in extending assistance to unfortunate members of the architectural profession. A tolerably sure test of the ability with which a charitable institution is conducted may be found in the relation between the gross income and the amount of the working expenses. In this Society the latter is less than ten per cent. of the former, which is a low figure. Subscribers and donors may, therefore, feel assured that their contributions are not wasted, but that the utmost amount of relief is granted to deserving applicants that the income will permit. We should, however, like to see this income, which for the past year was just under £1,200, very considerably increased. Even in the present hard times this does not represent the full extent of the support that should be accorded to the Society by architects in practice, nor is it sufficient to adequately relieve the necessities of those who fully deserve help.

The second annual exhibition of work executed by students of the School of Architecture connected with the Liverpool University was held last week in the exhibition room at Liberty Buildings, School Lane. Among the examples of design and measured work were some very promising specimens of draughtsmanship, and no small amount of originality. Interest was added to the collection by the perspectives, elevations, and detail drawings of cottages submitted in competition for three prizes of £25, £10, and £5 for the best designs for a block of seven cottages, offered by Sir W. H. Lever, and the first premium for these has gone to Mr. R. F. Dodd, with Mr. W. E. Davies second, and Mr. A. R. Sykes third.

To the list of architect-knights has now been added the name of Sir Thomas Manly Deane, R.H.A., on the occasion of the opening by H.M. the King of the new College of Science in Dublin, of which Mr. Deane, in conjunction with Sir Aston Webb, was the architect. We offer our congratulations to the distinguished representative of Irish architects who, as "Tommy" Deane, was known to, and popular with, a large number of his English confrères.

There is an unusual but gratifying spirit of good sportsmanlike feeling in the following letter, which has appeared in the *Manchester Guardian*:

Sir,—Lest recent correspondence should make it appear that there is any general dissatisfaction with the result of the preliminary competition, we, the undersigned Manchester competitors, wish to say that we consider that the Corporation has conducted the competition on excellent lines, and that there is nothing in the assessor's report that would lead us to think that the selection of the ten final competitors is anything but a fair one.—Yours, &c.,

Harry S. Fairhurst; France & Laycock; J. Gibbons & Son; Henry Goldsmith & Son; Lindsay Grant; E. W. Leeson; P. D. Lodge; F. P. Oakley & G. Sanville; J. Henry Sellers; Woodhouse, Corbett & Dean.

The Council of the King Edward National Memorial desire at least three prominent persons in every town and village throughout the country to volunteer to act as a local committee of the Hon. Grand Council, which aims to purchase the Crystal Palace as the King Edward National Memorial. They also require three influential persons in each town and village to act as collectors of instalments toward the £1 1*s.* life-admission tickets, and to sell Crystal Palace stamps on commission. Communications are invited from those willing to offer their services or to suggest other persons in each locality most suited to the above offices, so that the persons can be officially approached. Specimen Crystal Palace stamps will be sent to each correspondent. Letters should be marked "Committee," and addressed to the Right Hon. the Earl of Kinnoull, D.L., Hon. Treasurer the King Edward National Memorial, 26 Shaftesbury Avenue, London, W.

The Birmingham City Council has resolved, in view of the bequest of the late Mr. John Feeney, to erect further art galleries beyond those already arranged in the Council House extension, now approaching completion. These additional art galleries will be erected in Great Charles Street and the space below them is already bespoken by some of the administrative departments of the Council.

The Public Health Committee of the London County Council have made the following report, which will, if the suggestions therein contained are adopted, lead to a material alteration of the present law as interpreted by the Judges:—We have had under consideration a letter dated March 13, 1909, from the Hampstead Metropolitan Borough Council, calling attention to an appeal (Kershaw *v.* Brooks) by the borough council, which came before the Divisional Court by way of special case from the decision of Mr. Plowden, the metropolitan police magistrate, dismissing certain summonses issued under the by-laws as to drainage and as to deposit of plans made under section 202 of the Metropolis Management Act, 1855, and the Metropolis Management Acts Amendment (By-laws) Act, 1899. The question for decision was as to the person liable for an infringement of the by-laws. The Hampstead Metropolitan Borough Council summoned the responsible person actually carrying out the work, and the summonses were dismissed by the magistrate on the ground that they should have been issued against the person who ordered the work to be done. The divisional court sustained the decision of the magistrate, with the result that the practice hitherto adopted of proceeding against the responsible person actually carrying out the work would no longer be open to the metropolitan borough councils, but inquiries would have to be made as to who was responsible for the work being done. As the matter was of serious importance to the metropolitan borough councils, the Hampstead Borough Council asked the Council to amend the by-laws so as to validate the practice which has hitherto existed, and to make it clear, as suggested by the Lord Chief Justice in his judgment, that a builder or contractor in control of the works shall, in addition to the existing remedy against the owner, be responsible in cases of breaches of the by-laws. We have been in communication with the Local Government Board as to the desirableness of securing an amendment of the by-laws in order to place upon the builder the responsibility of complying with the by-laws. The Board stated in reply that it would be prepared to consider the terms of any by-laws proposed to meet the decision referred to, at the same time intimating that it was not satisfied that it was necessary to amend the by-laws, the effect of the decisions in the case of Kershaw *v.* Brooks, and in that of Brown *v.* Edmonton being to show that the applicability of the by-laws to a particular person must be judged by the facts in each case. In view of this expression of opinion we deemed it advisable to obtain the views of the metropolitan borough councils on the subject. In answer to a communication addressed to them, we learnt that most of the metropolitan borough councils were in favour of an amendment of the by-laws as suggested by the Hampstead Borough Council. As the result of further correspondence with the Local Government Board, the Board has intimated that it will be prepared to approve by-laws making the builder responsible in the event of any breach of the by-laws. We have accordingly had draft by-laws prepared in the form in which the Board is prepared to approve them. The by-laws will be subject to the provisions of sections 202 and 203 of the Metropolis Management Act, 1855, which provide that the by-laws, if made at one meeting of the Council, shall be of no force and effect until submitted to and confirmed at a subsequent meeting. We recommend—That by-laws as follows be made by the Council in pursuance of the provisions of section 202 of the Metropolis Management Act, 1855, and the Metropolis Management Acts Amendment (By-laws) Act, 1899:—"Notwithstanding anything contained in the by-laws made by the London County Council in pursuance of the provisions of section 202 of the Metropolis Management Act, 1855, and the Metropolis Management Acts Amendment (By-laws) Act, 1899, in the case of any work done to or in any pipe, drain, or other means of communicating with sewers and the traps and apparatus connected therewith, such plans, sections, and particulars relating to such work as are required to be deposited by the said by-laws shall be deposited by the builder and he shall be the person liable to the penalties provided in the said by-laws for the failure to deposit such plans, sections, and particulars. Such builder shall, in carrying out any such work as aforesaid, observe all the requirements contained in the by-laws made by the London County Council under the provisions of section 202 of the Metropolis Management Act, 1855, and he shall be liable to the penalties provided for a breach of the said by-laws. In these by-laws 'builder' means the builder, contractor, or person actually carrying out the work, but does not include a workman in the employ of such builder, contractor, or person."

ST. PAUL'S BRIDGE.

THE report by Sir William Emerson, Mr. T. E. Collcutt and Mr. J. J. Burnet on the scheme proposed by the Corporation is entirely in favour of that scheme and is as follows:

1. We have now completed our inquiries and consultations, and have the honour to reply to your letter inviting our opinion and advice in respect to the instruction of the House of Commons to the Committee on the Corporation of London (Bridges) Bill "not to agree to any scheme for the construction of the proposed new bridge, including the approaches thereto, until they are satisfied that the scheme, both in respect of architectural design and convenience of traffic, is the best adapted to the public needs and best suited to the character of the site."

2. We construe the words "the scheme" in the instruction as meaning the official scheme of the Corporation or any alternative scheme, for a bridge to open out at or near St. Paul's Churchyard, which is the "site" in question. We

have considered the scheme and also some other suggestions. The instruction opens up the three questions of—(*a*) The best adaptation to public needs; (*b*) appropriateness to the character of the site; and (*c*) architectural design.

3. We accept as essential conditions for a satisfactory scheme the following requirements:—(1) That the projected bridge must have its roadway at the level above high-water mark shown upon the section; (2) that the linking of the northern and southern tramway system is an integral part of any scheme; (3) that the roadway from the bridge must be carried as a bridge over Queen Victoria Street.

4. As to (*a*) adaptation to public needs, the object of the Bill is to relieve the congestion of traffic between south and north over London, Southwark, and Blackfriars Bridges, from a point in Southwark, near Marshalsea Road, direct to the main traffic roads to the north, *via* Aldersgate, and to offer facilities for connecting the tramway systems on the south with those on the north. After the most careful consideration, both separately and in frequent consultation, of various suggested or possible routes, and study of the general plan of London roadways and contemplated tramways in the neighbourhood of St. Paul's, we are of opinion that the line of route proposed by the Corporation is best adapted to the public needs, and to fulfilment of the objects of the Bill.

5. As to (*b*) appropriateness to the character of the site, we would point out that in the Corporation scheme the situation of St. Paul's in the relation of its line of axis to the central line of the river is not a factor. The area of the Churchyard would be increased, and there would be no consequential obstacle to the consideration of future improvements of the Churchyard. Moreover, better views of the Cathedral would be secured on the only side on which this can be done, without disturbing the picturesque charm of present surroundings. There is the further point of great practical importance that, owing to the depth of the Cathedral foundations and the quality of the subsoil, it is only on the eastern side of St. Paul's that a subway for tramways can be constructed above the level of the foundations without menace to the structure. (It is understood, of course, that the subway is not to be deeper than shown on the section.)

Having carefully considered these points and all the surroundings of the site we are of opinion that the alignment proposed by the Corporation is the one best suited to the character of the site.

6. In respect to (*c*) architectural design, we are in complete accord with the opinion of the Council of the R.I.B.A., that an architect or architects should have been appointed to collaborate with the engineers as to the general design of the bridge and its approaches when the scheme was initiated. In making this observation, the Council of the Institute were undoubtedly actuated by the desire—shared, of course, by the City authorities—that a fine monumental bridge of masonry should be erected. In skilled hands the bridge and its approaches can be made a magnificent addition to the river scenery about the City.

7. Since the scheme was published side issues have been raised as to the "opening up" of St. Paul's. At first sight, and without detailed expert scrutiny, the idea that the opportunity might be taken to open up a vista terminating in the south transept of the Cathedral is attractive. The project shown by black lines on the plan has appealed to some architects and to a section of the public, and there has been a tendency to subordinate the main purpose of the new avenue of traffic between north and south to what would at the best be a subsidiary aim. In considering the project three points of great importance have to be borne in mind. They are:—(i.) The alignment of the bridge in relation to the river, since the proposed vista would only be obtainable by the building of a skew bridge; (ii.) the width of the northern approach to the Cathedral; and (iii.) the possibility of future river embankments being constructed below Blackfriars.

8. We are of opinion that the suggested alignment is not good, and that as it would be almost impossible to make a satisfactory monumental design for such a skew bridge in masonry, it is probable that the bridge would have to be of steel—a contingency which the R.I.B.A. evidently wished to prevent.* There is strong presumptive evidence that Wren did not design the side elevation of the Cathedral to be looked at from any great distance. This is shown by the bolder treatment of the west front and of the dome as compared with the comparatively superficial ornamentation of the other wall surfaces. And in this matter the great architect followed the best traditions of his profession. We know of no famous public building, either here or on the Continent, in respect to which it has been considered necessary to arrange great roads leading to the side of the structure. Wren evidently did not contemplate such approaches in the case of the Cathedral, but he did contemplate a wide road at the east end, and that he was capable of taking large views as to future requirements was shown by his well-known plan for the rebuilding of London. We may add that the Greeks—great artists—took especial care that the Parthenon should not be approached by a road leading directly up to it. [* I am of opinion that it would be possible to construct a bridge over the river giving a vista of St. Paul's, which I should much prefer if found practicable.—T. E. COLLCUTT.]

9. Further, it is to be observed that views not less interesting than the suggested "vista" will be opened up by the roadway proposed by the Corporation, and that it would not prevent improvements subsequently being made, if necessity arose, in connection with a general scheme for improvement of the Churchyard. We wish it to be clearly understood, however, that in our opinion there is a limit to such "improvement," and that to exceed it would be to place Wren's design at a positive disadvantage by bringing it under conditions it was not designed to meet. But such limit would not be exceeded by the improvements the proposed Corporation route would effect, and facilities would be offered for opening up picturesque views of St. Paul's which have hitherto been obscured.

10. While it has been no part of our duty to examine with care the financial aspects of the conflicting schemes which have been the subject of public discussion, we feel it right to say that we have been impressed by the extent to which the "vista" scheme would involve altogether heavier expenditure, out of all proportion to the Corporation project.

11. With respect to the suggestions we are asked to make, we agree with the Council of the R.I.B.A. in their recommendation that architects should collaborate with the engineers in the designs for the bridge, the archways over Queen Victoria Street and Thames Street, and the approaches as well as the accesses from the lower and higher levels, and in the debouchment of the roads. If the general scheme is passed by Parliament we advise that such architect or architects be appointed.

12. We submit the following suggestions for improvement of the scheme as shown on the plan:—

(1) That where the bridge road debouches on to Cannon Street it should be opened out as much as possible within the lines of deviation, and that the corner building to the south-east of Old Change be also acquired, thus opening that corner towards St. Paul's.

(2) That the building frontage along Old Change should be no nearer to the east end of the Cathedral than at present, any future buildings following that line, and that the whole of the existing buildings between St. Paul's and Old Change should be removed.

(3) That at some time the property now obscuring the south end of the Post Office in St. Martin's-le-Grand be acquired, and the space opened up and arranged so that a fine suitable architectural feature might centre on the line of the new bridge. If this were done it would also be possible for Foster Lane to somewhat relieve the traffic by St. Martin's-le-Grand.

These alterations would give views of both the south-east and north-east sides of St. Paul's not hitherto obtainable. Further, ample space would be provided for the traffic at the road junctions, and right-angled crossings would be avoided.

Mr. A. J. Barry, engineer to the Dean and Chapter of St. Paul's, has expressed in a very forcible manner his opinion on the relative danger to the stability of the Cathedral of the southern and eastern tramway routes in the following letter to Mr. Basil Mott, the Corporation's engineer for the bridge:

> In reply to your letter of the 27th inst., in which you inquire what my views would be as regards the possible damage to St. Paul's Cathedral if a tramway subway were constructed nearer to the south side of the Cathedral than shown on the plans that have been discussed between us, I beg to say at once that I should regard with the gravest concern any proposal that would involve the excavation of the subsoil nearer to the Cathedral than is shown on the plan you submitted to me, more particularly if such disturbance of subsoil took place on the south side of the Cathedral.
>
> After discussing with you the *maximum* depth to which the foundations of the tramway subway as proposed to be constructed under your Bill of this year should be carried, the horizontal distance of the same from the foundations of the Cathedral, and after agreeing on certain protective works to be carried out before the proposed excavations were commenced, we eventually agreed with you certain clauses for

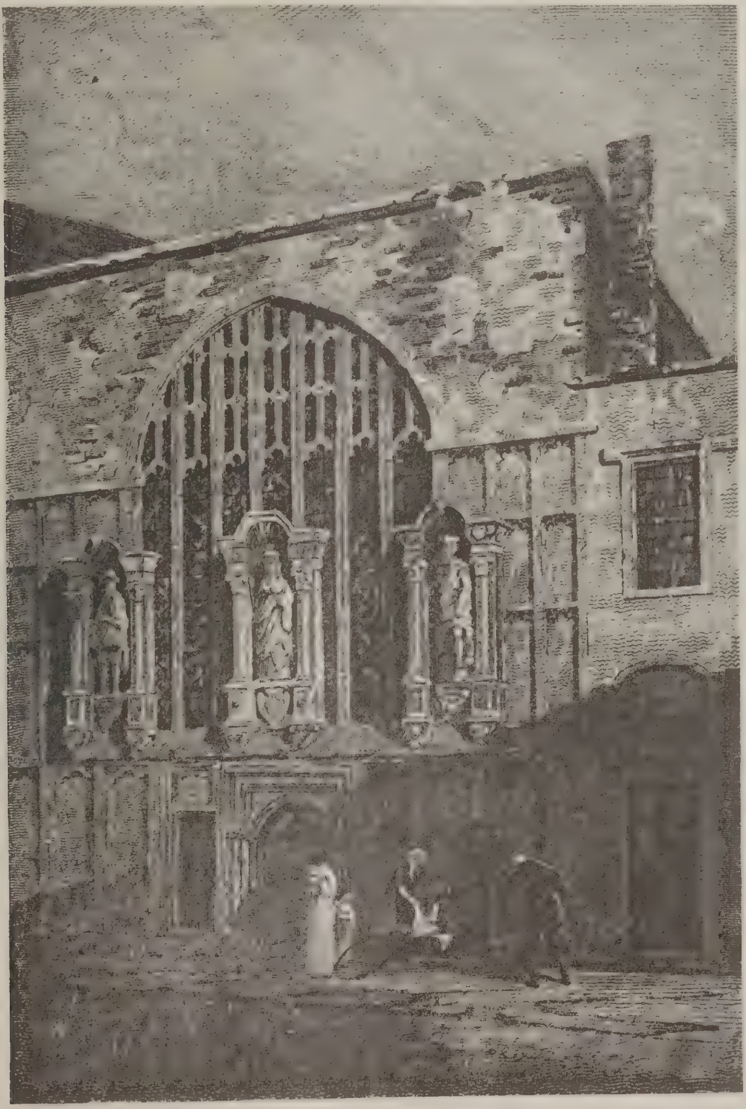
the protection of the Cathedral. In consenting to the disturbance of ground even in the situation as then proposed we were not without some misgivings, and in accepting the clauses which were finally agreed we were actuated by the desire not to interfere if possible with a work of great public importance. We were influenced, too, by the fact that the proposed excavations for the tramway subway would only affect that part of the Cathedral foundation which carries the least weight and is most secure.

When you inquire what my views would be as to the possible danger to St. Paul's if the subway were constructed nearer to the south side of the Cathedral, I presume you have in your mind the construction of a tramway under St. Paul's Churchyard from the point about opposite to the centre of the south transept window eastwards and round the east end of the Cathedral. I have no hesitation in saying that from an engineering point of view I should regard the carrying out of such a proposal as certain to cause the most serious damage to the structure of the Cathedral. The main dome is, as perhaps you know, carried on four main corner piers, in addition to eight intermediate ones. The four piers on the north side have settled very little. In every case the piers carrying the south segment of the main dome have settled considerably more than any of the others. The south wall of the west transept has developed serious cracks, and there has been a general movement or draw of the whole structure towards the west and the south. This is evidenced by numerous cracks in the building, and by the fact that the south wall of the building is already out of the vertical. Generally I regard this part of the Cathedral as already being in a state of comparatively unstable equilibrium, and I should regard a far less serious disturbance of the subsoil than that which would be involved by the construction of so large a work as a tramway subway as close to the south wall of the building as I understand is proposed as entirely unpermissible in the interests of the security of so important a public structure as the Cathedral.

THE GUILDHALL, LONDON.*

LLYN-DIN—the Lake Fort—was the earliest name of London. The Romans called it by a title which would have suited it as well in after generations—Augusta—but after their departure the Latinized form of the British name prevailed, and remains to this day. The earliest recorded fortification of the city extended between the river Fleet on the west and the Wallbrook on the east. This citadel was built somewhere about A.D. 43. The Romans, on taking possession, built the first wall between A.D. 350 and 369. It enclosed 380 acres, and was three miles two hundred yards long. On one side was the river, and the extent of the wall may be gauged by the position of the various *gata*, Dowgate, Ludgate, Newgate, Aldersgate, Bishopsgate, and Aldgate. There were also the *gata*—or ways—on the river side, Billingsgate and the smaller posterns, one on the north side of Tower Hill, where the name "The Postern" might have been seen at the corner of a narrow street ten years ago, and on the landward side we have Aldermanbury Postern, which served a similar purpose. Then there were the various bastions, one of which, in London Wall, when demolished, was found to contain many portions of sculpture which have found their way to the Guildhall Museum. The bastion in Cripplegate Churchyard still stands, and one has been excavated in digging the foundations of Christ's Hospital.

There is but little of tradition or custom that can be



GUILDHALL CHAPEL, LONDON From an old Engraving.

---

* Read at a meeting of the Upper Norwood Athenæum by Mr. Walter B. Briant.

traced to the Roman occupation, but we find most interesting antiquities, foundations of buildings, and mosaic pavements; they also left as ports Queenhithe and Billingsgate, and a fortified bridge.

Augusta seems to have been abandoned and become ruinous when the Romans retired, so that when the Saxons rebuilt the city it was on different lines to suit their inclination. Unhappily for us, the fire of 1135 destroyed practically every trace of the 400 years of this Saxon occupation, and there is not a stone that can be identified with the period. Through successive changes, Roman, Saxon, Danish, Norman, through the vicissitudes of nine visitations by plague, four or more destructive fires, London in general and the City in particular has ever been growing in importance.

The word Gild is of Saxon origin, and is derived from Geldan, or Gildan, which means "to pay," because the members of societies so-called, whether united for civil or religious purposes, were "Gildare"; that is, to pay something towards the support of the brotherhood to which they belonged. A Guild was a body of men associated together, under oath, for a common purpose.

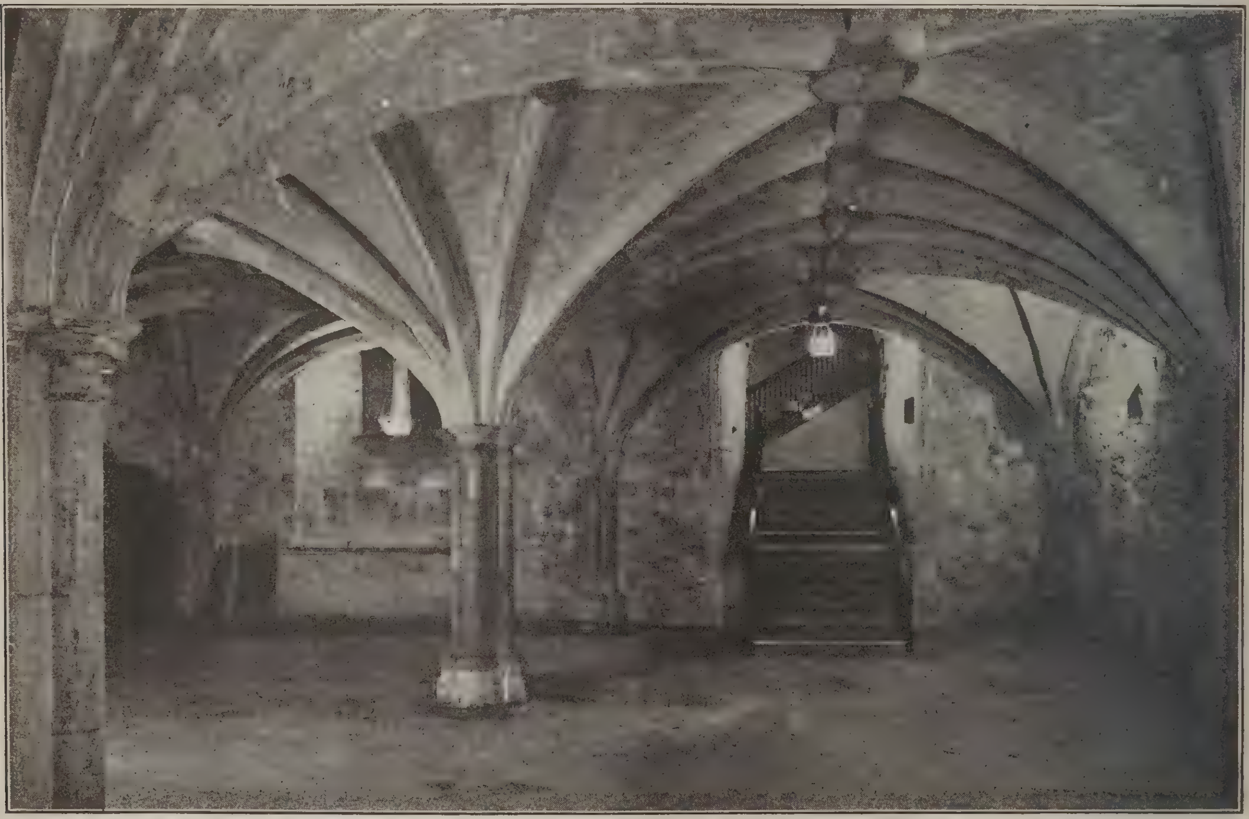
According to Stow, in the days of King Edgar thirteen knights "requested to have a certain portion of the land east of the city forsaken by its inhabitants by reason of too much servitude, with the liberty of a guild for ever fulfilling the conditions laid down; the King named it the Knighten Guild in Portsoken (Ward)."

It is beyond the scope of this paper to deal with the objects of guilds generally; that they were religious, social, and mercantile there is no doubt, but the formation of the companies was of a more mercantile character. When licensed, the companies exercised a vigorous control over their various trades; settled the hours of labour, wages, and output, and they were governed by their own wardens, who tested the quality, weight, and length of the goods to be sold, and generally maintained the common interests of the trade.

The oldest company of all is the Weavers, which received its charter from Henry II. Although licensed, they were not incorporated until the reign of Edward III. There were eighty-nine in all, of which seventy-six exist to-day, the leading ones being the Weavers, Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Taylors, Haberdashers, Salters,- Ironmongers, Vintners and Clothworkers, but except for the Goldsmiths, Apothecaries, and Stationers they now exercise no control over their trades.

Besant reminds us that the chief market-place was in Cheapside, a broad, open space with booths and sheds; on the north side there was Wood Street, Milk Street, Ironmonger Lane, Honey Lane, the Poultry; and on the south, Bread Street, Candle Street, Soap or Soper Street, Fish Street, and (Moneychanging or) Old Change. The Companies, among other things, grouped their trades together in certain places or localities. The Companies early sought to form a common stock for the relief of poor or decayed members, and while supporting a variety of charities, founding schools, almshouses, hospitals, and the like, they used also to advance varying sums of money to start beginners in business.

London, as a city, has always had a ruler of its own. In Roman times the Prefect served as governor, magistrate, and custodian, and its privileges have ever been jealously guarded for the citizens by him. With the advent of the Conqueror came the first of the Charters, which he saw it was wise to grant, guaranteeing the liberties and self-government of the citizens. It was in 1189 the first Mayor was appointed, Henry Fitzalwyn, who retained office until 1212. Eleven years later the Court of Aldermen was formed, and in 1348 the first Common Council was held.



THE CRYPT OF THE GUILDHALL, LONDON.

The City has had conflicts of its own to fight, as well as to settle disputes of others. It backed up the barons in their demands for a charter of liberties, which John so reluctantly granted; it was at variance with Plantagenets and Tudors, and in particular with the Stuarts. Charles I., in demanding the surrender of the five members of Parliament, did much to estrange the loyalty of the citizens; Charles II. again contested the right of the City to go beyond what it claimed as its chartered powers. "Quo warranto" was issued, and the citizens were deprived of their right to elect the Lord Mayor and aldermen. This continued for six years, Charles II., afterwards James II., making the appointments. When the charter was restored the sympathies of the citizens had gone in favour of the Prince of Orange.

Lord Mayor Beckford in 1770 remonstrated with George III. over his indifference to the citizens' addresses, and that so vigorously as to win for himself a lasting monument. Again the City protested against the policy of the same King's Ministers towards the American Colonies, "big," as they said it was, "with all consequences which can alarm a free and commercial people."

In 1807 Sir Francis Burdett, Mayor, was committed to the Tower by the House of Commons for upholding the right of freedom of speech, but on the protest of the Livery he was released at once. But with all their conflicts the City has been loyal to the powers that be, and ever delights to entertain and honour kings, princes, and famous men, of whatever race or station.

As Chief Magistrate, the Lord Mayor has had to preside at many trials of historical importance. That justice has not always been administered, and at times vindictive, brutal, and unwarrantable sentences passed, must be always a stain on the otherwise wise rule of the City.

To recall a few of the more important. Henry Howard, Earl of Surrey, was tried in 1547 for high treason; he was convicted, and afterwards beheaded on Tower Hill. Lady Jane Grey, her husband, Lord Guildford Dudley, and his two brothers were tried for high treason, and all beheaded. Lady Jane had consented to succeed Edward VI. This passing over of Mary was done with the concurrence of the Lord Mayor, Corporation, and others, but Mary naturally resented it, and won back for a time the goodwill of the citizens, to whom she had appealed personally. Cranmer, for complicity in the same connection, was also tried and beheaded.

In 1450 Jack Cade, with a body of 15,000 followers, entered London, and compelled the Lord Mayor to pass sentence on Lord Saye and Seal, a favourite with the King, and the sentence was carried out in Cheapside.

The trial of Anne Askew, "for speaking against the Sacrament of the Altar" during the reign of Henry VIII., was the most notorious of any. She underwent six examinations or trials, three of them at the Guildhall. After being racked she was burnt alive at Smithfield. Sir Nicholas Throckmorton in 1554 was tried before Commissioners, including the Mayor, for treason against the Queen by complicity in Wyatt's rebellion. The jury found him not guilty, but so dissatisfied were the Commissioners with the verdict that they committed the jury to prison. Four were released, but the others were fined in amounts varying from 2,000*l.* to 60*l.*

Richard Baxter in 1685 was tried before Lord Chief Justice Jeffreys for writing a paraphrase upon the New Testament, and was fined 500*l.*, which afterwards was remitted. He was released nine months later.

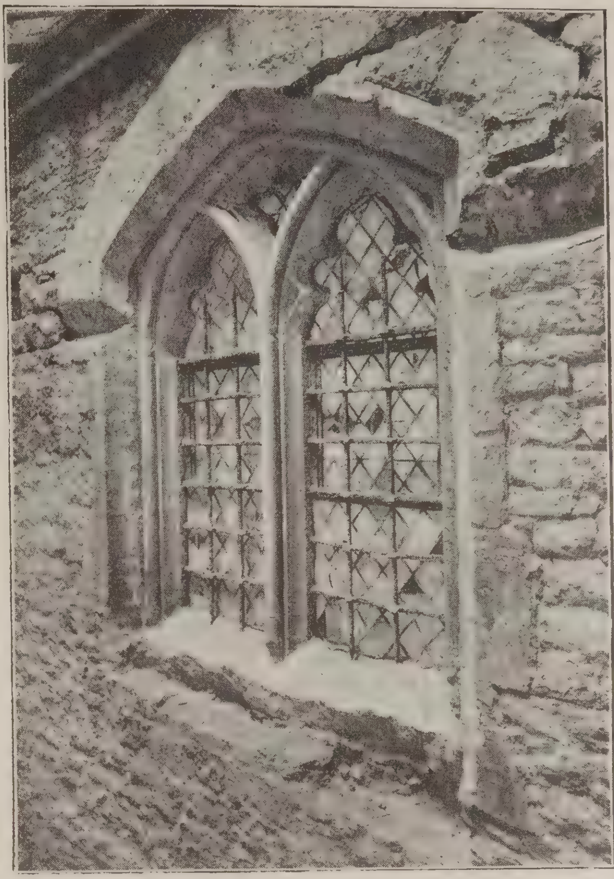
The word Guildhall, to which as a structure we will now turn, was variously spelt "Gyhald," "Guyldhall," "Yieldhall," "Yeldehall," meaning the place appointed at which the burgesses should yield or pay their taxes. It is probable that a building existed in 1189 for this and other civic business, one Richard Fitzreiner giving a portion of his estate for the purpose. It is supposed to have stood on the east side of Aldermanbury, but further west of the present building, and quite independent of it, as Mr. Sydney Perks, the City Surveyor, leads us to believe. The first building was described by Fabyan, an alderman, as "An oylde and lytell cottage;" and in 1411, "Ye Guyld Hall of London began to be new edyfied."

Although commenced in 1411, several years elapsed before the hall was completed, lack of funds required being the reason. In 1422 Richard Whittington's executors contributed 20*l.* to the paving, and a year later another 15*l.*, with a further contribution in 1423 towards glazing the windows. Originally the building was lower than we see it to-day. After the fire in 1666 Wren added a storey with circular-headed windows and a flat plastered ceiling. Illustrations of this may be seen. It was intended to be of a temporary character only, but it stood for 200 years, until the roof was entirely reconstructed from the designs of Sir Horace Jones in 1864. The front, designed by Dance, was also dealt with, and several other alterations made. The raised portion of the floor at the east end, no doubt, was for the purpose of a dais, while the higher vaulting in the eastern crypt just below gave head-room for an imposing doorway, the levels outside being much lower.

The porch, which is in a fair state of preservation, is part of the original building built in the years 1425-30. At one time it was 63 feet wide, and had two entrance doorways, and was in part three storeys high.

The vaulting shows the arms of Edward the Confessor and Henry VI. Six statues decorated the front at a later period, but nothing is known of them since 1846, when they were sold for £100.

The crypt is especially interesting; it is a double one, with a dividing wall. The western portion shows little of architectural interest in its present condition. The vaulting collapsed at the great fire, and instead of being restored in stone, the floor of the hall was carried on the brick arches as we see them. Mr. Sydney Perks, the City Surveyor, has had some examinations made, which go to prove it was undoubtedly part of the original basement built in 1411 and used for storage and other general purposes. The eastern portion was designed with more regard to effect, and in as good a manner as is the porch with Purbeck shafts and firestone ribs to the vaulting. Various stairways have been opened up, showing ways of access to the hall above, in conjunction with which it was used. It could not be better used to-day than it is as an annexe to the Museum.



A FURTHER VIEW OF THE EXTERIOR OF DISCOVERED WINDOW AT THE GUILDHALL, LONDON.

We share with the city surveyor the hope he has expressed that the western crypt may be restored to something like its original form.

Some buildings which were intimately connected with the Guildhall, but have now been removed, call for a passing reference. Stow records in 1424, "Then was built the Maior's Chamber and the Counsell Chamber with other rooms above the Staires."

This, then, was the first Council Chamber. It seems to have been re-erected in 1614, and adjoined the north wall of the hall, and was used until 1777. It occupied part of the site of the present Council Chamber. The old Council Chamber, used from 1777, occupied the site of the present offices of the city surveyor. It is remembered for having been the scene of the presentation of the City's freedom to Nelson, Wellington, Brougham, Pitt, Disraeli, Livingstone, and others. To quote what was said of the chamber in 1884, "Here have been fostered and supported those great charities which are the glory and boast of this old England of ours." The inauguration of most of the great public improvements took place in this chamber.

According to a later chronicle, Guildhall chapel was erected by Richard Whittington in 1406. It says: "He also buylded for the ease of the Maior of London and his bretheren and of the worshipfull citizens at the solemne dayes of their assemblie a chapell adjoining to the Guyldhall, to the extent that they should ever before they entered into any of theyr affayres, first to go into the chapell and by prayer to call upon God for his assistaunce." This would be early in the fifteenth century, but there seems to have been a chapel as early as 1280. The building stood until 1822 on a site which is now the picture gallery. It was dedicated to St. Mary Magdalene and All Saints. The history attaching to it is interesting, especially of its keepers, chaplains, and chantries. At the great fire the roof was burnt off, and it was otherwise partially destroyed.

The three statues which are now on the staircase leading from Basinghall Street decorated the west front, and were placed in niches, as shown in our illustration, facing the Guildhall Yard. They represented Edward VI., Charles I., and his Queen. The west window, with seven lights, was perhaps the chief architectural feature of the building. When pulling down the old chapel, a massive Purbeck stone coffin was discovered next to the north-east corner, which is now preserved in the crypt. The inscription reads: "Godfrey the Trompour lies here; God have mercy on his soul"; the date about the thirteenth century. The Corporation bought the chapel and library of Edward VI. in 1550 for £456 13*s.* 4*d.* The Mayor and Aldermen attended service here until it was given over to secular uses, when it became the Court of Requests, an office, and Courts of Law. It also served as a lumber store.

Blackwell Hall, also spelt Bakkewehalle, occupied a site next to the chapel, which afterwards became the Bankruptcy Court, and is now the picture gallery. Its frontage to Guildhall Yard was 105 feet, and with a depth of 188 feet. It also fronted Basinghall Street. It dates back from 1293, and originally belonged to the Clifford family and afterwards to the Basings. It fell into the hands of the Crown, by whom it was sold to the Corporation in 1398 for £50. Opened as a cloth fair or market-place for the sale of woollen cloth, we are told that "no manner of person, foreigner or stranger, bringing woollen cloth into the city for sale, shall house, show, or sell the same at any other place within the said city or in the suburbs thereof, than at Blackwellehalle," and, further, "No person shall sell any manner of cloth at any time in the week, except between eleven of the clocke before noon on Thursday and eleven of the clocke before noon on Saturday, on pain of forfeiture of all cloth sold to the contrary hereof."

The care of this place was vested in the Drapers' Company by Henry VIII. Rebuilt in 1658, at a cost of 2,500*l.*, it was entirely destroyed at the great fire and re-erected in 1672 in form which we show in the illustration. It contains two open courts surrounded by warehouses. It was finally pulled down in 1820.

It was a happy idea that the Court of Common Council should about the year 1826 "consider it well to provide a suitable place for the reception of such antiquities relating to the City of London and suburbs as may be procured or presented to this Corporation." A start to collect was made when excavating the site of the old Post Office in St. Martin's-le-Grand, also when rebuilding London Bridge in 1841, the Royal Exchange, the formation of Queen Victoria Street, the National Safe deposit, the underground railways, and many works or other buildings with deep excavations. The antiquities recovered were housed in the ante-room of the old library. Additions of various kinds have been added from time to time. Mr. H. B. Hanbury Beaufoy presented his collections of tradesmen's tokens; Dr. F. P. Weber his coins and medals, &c.; the Watchmakers' Company show their most interesting collection of old watches and clocks, &c.

To attempt, however, to describe what the Museum contains is quite unnecessary.

London in Roman times must have been closely populated by a cultured, wealthy, and artistic people; that is to say, judging from what we find. However much we, as members of an archæological society, deplore the destruction of building of historic interest, necessitated by public improvements, we are thus able at least to see countless treasures and relics of past ages which have been unearthed, and these in a fair state of preservation. It is interesting to speculate as to how such a mixed number of articles came to be together at such depths.

Buried at varying depths of 5 to 20 feet below present levels, especially at Walbrook, suggests that the articles found were from an abandoned marsh settlement on the banks of the brook: nothing later than 350 has been found here. Some articles are found in black ashes, no doubt those of the wooden houses destroyed by fire, or even possibly the Walbrook provided a convenient tip, as we should now call it, for rubbish contractors. At any rate, the City Fathers of Roman times may have preferred this easy way of getting rid of their lumber and rubbish to that of burning it up in a destructor on the Surrey side, and so destroying all trace of it, as is the approved way of the twentieth century. Any way, we are glad to-day to be able to inspect the contents of many a Roman sanitary dustbin.

In conclusion, I would like to acknowledge my indebtedness to Mr. Lambert, the assistant-librarian, to our Chairman, and to Mr. Harradence, all of whom are the embodiment of helpfulness in such matters.

This meeting has fitly been arranged by our executive to celebrate the 500th anniversary of the erection of the Guildhall. "Domine dirige nos."

ILLUSTRATIONS.

THE BLIND SCHOOL, YORK.

THE sketch shows the Blind School at York as seen from the grounds of St. Mary's Abbey. Originally the building formed the residence of the Abbots of St. Mary's, but at the dissolution of the religious houses in 1538 Henry VIII. turned it into the Palace for the Council of the North. The first occupant under the new régime was Robert Holgate, Bishop of Llandaff, afterwards Archbishop of York. Henry himself resided here with his Queen, Catherine Howard. The next President was Francis Talbot, fifth Earl of Shrewsbury, quickly followed by the Earl of Rutland and Archbishop Young. The next President, Thomas Radcliffe, Earl of Sussex, made considerable additions to the King's Manor, as it was then called, and further additions were made by the Earl of Huntingdon and the Earl of Sheffield. The Great Council of the North, hated by the people, came to an end in 1641, and the last and greatest President, the Earl of Stafford, was executed. It underwent the siege of York in 1644, and in the reign of Charles II. became a private residence and remained so until the year of Queen Victoria's accession, when it was leased to the trustees of the Yorkshire School for the Blind. The wing on the left was probably erected by the Earl of Huntingdon, and the one on the right during the presidency of the Earl of Stafford. The walls of the older part are built of coursed limestone, probably from Tadcaster; the later wing is built of thin 2 inch red bricks, the whole being roofed with flat tiles. This drawing by "Le Quayt" was awarded a prize last month in *The Architect* Students' Sketching and Measuring Club.

PROPOSED GRAMMAR SCHOOL, PENRITH.

IN a competition held for designs for the erection of the above, out of 110 competitors the design here illustrated was placed fourth.

The building was designed facing Station Road, with a girls' playing field and gardens for horticulture in the rear. The building to be faced with local grey bricks except the base, quoins and arches, which were suggested to be faced with red sand stocks.

The caretaker's house with domestic room adjoining is placed in the south-west corner of site, with direct access from the main road. The assembly, laboratories and art room, which are common to the two departments, are placed in a central position; the hall, moreover, has the advantage of not being a thoroughfare room.

Excellent supervision has been obtained by placing the headmaster's and senior mistress's rooms on the ground floor, and the assistant masters' and mistresses' rooms on the first floor.

The cloak and changing rooms and lavatories can be used in direct conjunction with the playgrounds and playing fields, as access to the school can be cut off when desired. The design was submitted by Mr. Edward Cratney, architect.

CATHEDRAL SERIES.—ELY.—SOUTH SCREEN OF BISHOP ALCOCK'S CHAPEL FROM RETRO-CHOIR—DETAILS IN BISHOP ALCOCK'S CHAPEL.

BISHOP ALCOCK'S Chapel contains some of the most charming late detail to be found at Ely, and of this we now give illustrations.

AN exhibition of drawings and designs made by the students in the Department of Architecture at University College, London, will be held from Friday, July 21, to Saturday, July 29, inclusive. The exhibition will be opened on Friday, July 21, at 5 P.M., by Mr. Leonard Stokes, P.R.I.B.A. Persons desiring tickets of invitation for the opening ceremony should apply to the Secretary of University College. The exhibition will be open on week days from 10 A.M. to 5 P.M. on the days following the opening to July 29. Tickets of admission are not required except for the opening ceremony.

THE Architectural Association will open their annual exhibition of students' work on Friday, July 21, at 3 P.M. Mr. F. Brangwyn, A.R.A., will be the special visitor. The exhibition will close Saturday, July 29.

CONGRESS OF ARCHÆOLOGICAL SOCIETIES.

THE twenty-second Congress of Archæological Societies in union with the Society of Antiquaries of London was held at Burlington House, W., on July 5. The chair was taken by Mr. C. H. Read, LL.D., President of the Society of Antiquaries.

The congresses of this body take place annually in the first or second week of July. At present they are attended by delegates from some forty-four of the larger archæological societies in this country. Matters of moment which concern all archæological bodies are debated, and the weight of the influence of the members affects improvements in matters interesting to archæologists throughout the country in a way which could not be expected if individual societies only were concerned. A further object of the Congress is to exchange experiences as to the best method of working such societies, to prevent overlapping and doubling of work, and to print economically such literature as may be useful to all the societies in union. Among their publications are the annual Index of Archæological Transactions Report, the Transcription and Publication of Parish Registers, and the Earthworks Committee's annual report upon the condition and destruction of the ancient defensive earthworks and fortified enclosures scattered up and down the country. Among the immediate publications promised by the Congress is a large Subject-Matter Index of Archæological Papers dating from 1665 to 1890. This will form a second, or supplementary volume to the Authors' Name Index of Archæological Papers with which the name of Sir Laurence Gomme, F.S.A., is so much associated, and which was published a few years ago. The affairs of the Congress of Archæological Societies are carried on by means of a Council which is elected annually, and the Society of Antiquaries places at its disposal their premises at Burlington House, W., for the annual meeting. The Honorary Secretary is Dr. William Martin, M.A., LL.D., F.S.A., 2 Garden Court, Temple, E.C.

At the Congress last week the following report was presented for the year 1910-11:—

The number of societies affiliated to the Union still remains at forty-four.

The resolution passed at the last Congress "That the matter of the Archæological Index be referred to the Committee to consider how the Index can be produced most cheaply, and how it can best be circulated at such a price as to pay its cost, and with full powers to make arrangements," was duly considered by the Archæological Index Committee. As regards the Annual Index, the committee has decided to publish it for the year 1908 at the price of 1s. per copy to members of affiliated societies, subject to a discount of 33 per cent. to societies purchasing a quantity. In the event of the cost of production not being met by the sale of copies, the committee would recommend its discontinuance. The Council expresses the hope that all the societies in the Union will find it convenient to purchase copies of the Index when published, and thereby assist in securing continuation of this important publication. The manuscript is well advanced, its production having been promised by the compiler early in the autumn.

With respect to the large Subject-Matter Index, 1665-1890, the committee, by means of a donation of £10 from one of its members and by a grant from the Society of Antiquaries, will be enabled to purchase from Messrs. Constable & Co., Ltd., the index-slips and other papers which Messrs. Constable have prepared, and to arrange with the Honorary Secretary of the Congress for the completion of the Index. When completed, the question of printing the Index will then be considered.

The revised scheme of the Earthworks Committee for recording ancient earthworks, the preparation of which was announced in the last Earthworks Report, was distributed in November, 1910, to those societies which subscribed towards its issue. About twelve hundred copies remain in the hands of the committee. Part of this number will be used for individual distribution to inquirers. The Honorary Secretary of the Earthworks Committee, Mr. A. G. Chater, finds it necessary to resign office. As his successor, the Council has appointed Mr. Albany F. Major. As before, the report for the past year of the Earthworks Committee will be issued separately.

The resolution passed at the last Congress—"That this Congress approves the principle of Mr. Johnston's proposal (as to church restoration, &c.), and requests the Council, in conjunction with Mr. Johnston, to draw up a recommendation that may be circulated by the Congress to the Bishops"—received the attention of the Council. The Council, after considering the matter, passed the following recommendation:—"That the position of the Society of Antiquaries of London in respect of work hitherto accomplished in advising diocesan authorities on matters of church restoration should be strengthened by the grant of additional powers through 'The Ancient Monuments (England)' Royal Commission; and that the Council of the Congress of Archæological Societies of England and Wales recommends the appointment of the society as the advisory authority for England and Wales in all matters relating to the fabric, furniture, and monuments of churches."

This recommendation was duly forwarded to and acknowledged by the Royal Commission and by the Society of Antiquaries.

The resolution passed at last year's Congress—"That His Majesty's Government be respectfully asked to direct that arrangements shall be made by the authorities at Somerset House that access for literary study may be given to all documents, ecclesiastical as well as Probate records now in their charge, in the same way as at the Public Record Office"—was forwarded in due course, and a reply was received that the resolution would receive the Prime Minister's attention.

The Council records with satisfaction the appointment of a Royal Commission to inquire into and report upon the preservation and indexing of Public Records. In view of this appointment, the Council decided, as regards the resolution passed at the last Congress, concerning the desirability of increasing and expediting the issue of Public Record office volumes, that it was sufficient for the present to inform the Commission of the Council's desire to tender any assistance within its power in furtherance of the aims and objects of the Commission. The offer of assistance was duly acknowledged.

Some considerable discussion took place on the subject of Mr. P. M. Johnston's proposals as to church restoration, which are alluded to above. At the Congress of 1910 Mr. Johnston had introduced a motion expressing the cordial approval of the Congress of an arrangement in operation in the Diocese of Chichester, by which the Bishop consented to submit to an Advisory Committee appointed by the Sussex Archæological Society, before issuing a faculty, any proposals that might arise for enlarging, restoring, altering, rebuilding, or re-fitting any ancient church or chapel-of-ease within the diocese; an arrangement by which the Bishop also invited warning and advice in the case of proposed alterations of importance. He also moved a resolution that the Bishops of the other English and Welsh dioceses be formally invited by the Congress to accept the services of similar consultative committees, if formed by the local archæological societies. Mr. Johnston described the genesis and working of the committee, and mentioned cases in which it had successfully intervened. Many small alterations and refittings were, he said, often done without a faculty; but the Bishop of Chichester insisted on everything being submitted to him before a faculty was granted.

In the subsequent discussion last year it was suggested that the proposal was one unsuited for adoption, as the Bishops and the Chancellors would resent any interference with their functions, and the local architects would likewise object. As a consequence of these possible difficulties, Mr. Johnston's resolution was somewhat modified, and was finally carried as follows:—"That this Congress approves the principle of Mr. Johnston's proposal, and requests the Council, in conjunction with Mr. Johnston, to draw up a recommendation that may be circulated by the Congress to the Bishops."

At the Congress last week Mr. P. M. Johnston, F.S.A., F.R.I.B.A., again brought this matter up. He said he felt that the recommendation given above in the Council's annual report was hardly sufficient. He therefore moved a rider to it as follows:—"This Congress of Archæological Societies of England and Wales and Ireland, recognising the importance of local knowledge and influence, approves the step already taken by the Sussex Archæological Society in setting up a sub-committee to watch over the ecclesiastical antiquities and to warn the Bishop of any threatened mischief to an ancient church, and to tender advice where a faculty is applied for within the diocese of Chichester. The Society further commends this arrangement to the consideration of other archæological societies for imitation where circumstances allow. Such local action to be supplementary to the general powers sought to be obtained for the Society of Antiquaries through the Ancient Monuments Royal Commission of England and Wales." The above rider was debated and amendments proposed. These were at length withdrawn, and Mr. Johnston's rider was passed unanimously. It was generally felt, however, by the delegates that it was far better to approach the Society of Antiquaries as a court of appeal than to leave such matters in the hands of special local committees, since the Society's representations would have far more weight with the authorities than any action by local people.

THE ARCHITECTURE OF LONDON HIGHWAYS.

By "VIATOR."

TO AND THROUGH PALL MALL.

THERE is a natural temptation to head this article "Clubland"—a temptation to which surrender might be made were it not that it is necessary, in the earlier portion, to consider not only a Royal palace, but also various memorial erections, and elsewhere office blocks and noblemen's mansions are also cast on the screen; consequently the obviousness of the desired title would not have been conspicuous.

There is but little that is really ancient in this district. St. James's Palace—the building that gives its name to England's Royal Court—carries our thoughts back to the earlier years of the sixteenth century, when bluff King Hal suppressed a hospital that stood on the site and erected a Royal palace in its stead. There is an air of picturesqueness about the straggling pile, not at all increased by the sooty accumulations from the atmosphere. Though not strikingly architectural, there is yet an interest attaching to the work of Hans Holbein, the well-known portrait-painter and architect. Unpretentious as the Palace may be, it yet serves to show the superiority of unassuming brickwork over assuming stucco, the latter so much in evidence at Buckingham Palace and many other important buildings.

Before considering any of the latter, attention may be directed to some of the memorials that this district contains. Undoubtedly the finest is the equestrian statue of Charles I.; it stands now upon the site of the original Eleanor Cross, the modern copy of which we have already observed in the courtyard of the railway terminus. In the unregretted days of Puritan sway the cross was demolished, and the King's statue (erected in 1633) was taken down also during the Cromwell régime. After the Restoration the equestrian group was re-erected in its present position, though the iron enclosure of former days has disappeared. Who amongst us can fail to recognise the inappropriateness of the selected site? The heroic queen of King Edward I. to be superseded by the unheroic and ill-fated Charles I.! But setting aside this historic unseemliness, the artistic merits of the memorial must appeal to all. A fine, dignified statue of the king cast in copper (and doubtless a faithful presentment of the features and picturesque attire of the ill-starred monarch) provides a fragment of history torn from the book of records, to be set here in the public gaze, and not unpathetically directing his looks towards the place of his execution. Le Sueur's work is a masterpiece; and if he is also responsible for the stone pedestal (though this has been attributed to Grinling Gibbons) our praise of him must receive an access of fervour. Pity 'tis that the gnawing tooth of Time, the destroyer of all things, aided by the deleterious atmosphere, should have so defaced, and even effaced, the carving; but sufficient is yet left to enable us to gain an impression of the whole. Close inspection shows that the carved shields of the Royal Arms bear on quarterings the lilies of France; at that period, and for some time subsequent thereto, England asserted her dormant claims to sovereignty "over the water" by the addition of such quarterings and by the insertion in the regal title of the word "Franciæ" (Rex).

But if Le Sueur's work is a masterpiece, such cannot be said of Matthew Cotes Wyatt's bronze equestrian group of George III. in Cockspur Street. Regret is keen that Time's gnawing tooth, or some other kindly agency, could not take effect here instead of elsewhere. Attention may be directed, in passing, to the too-forward position of the group on its pedestal, with the result that the horse seems to be shying at his apparently uncomfortable insecurity.

The architecture of Simeon Stylites is an error, and no prescriptive use can justify it. In this very district there are two examples. There is no temptation to linger by the Duke of York's column overlooking the Mall in St. James's Park; let it suffice that it lacks such merits as attach to the Nelson column, and substitutes none on its own account. The Trafalgar hero memorial, however, even if monumentally silly, is architecturally good in detail. Irrespective of its purpose, William Railton's work is a fine conception. But in raising a memorial, surely the crowning effigy should be capable of close inspection by the wayfarer! The gallant Nelson! he was indeed a lion; and yet on his own monument he is skied and set uncomfortably astraddle on his lofty perch, whilst other lions are placed within easy range of vision. Certainly Sir Edwin Landseer's supporting couchant beasts may be taken as a guard of honour, and there are those who would urge that our naval hero was not one who desired to be foremost in the public gaze; assuredly, however, this was not the inspiring *motif*. Again, when we remember the connotation of the word "Corinthian" in the early years of the nineteenth century, the appropriateness of the use of this architectural order in connection with Nelson is not apparent. The statue (by E. H. Baily, R.A.) is 17 feet in height and is very theatrically posed. The bronze panels on the pedestal form, together with Landseer's lions, the most pleasing features of the memorial; nor is this the only instance where subsidiary portions take artistic precedence, another metropolitan example being the Albert Memorial in Kensington Gardens. Nelson's memorial was not completed before 1843, occupying six years in erection.

Only passing notice can be accorded to Sir Francis Chantrey's fine equestrian statue of George IV.; the King's gaze is directed towards St. James's Park, where his former residence, Carlton House, was situated. By the irony of fate it has been decreed that the sole relics of that house (some columns) have been incorporated in the portico of the National Gallery in the rear of the King's statue.

Hamo Thornycroft has produced a delightful statue of Charles George Gordon, set in the centre of Trafalgar Square. It would have been so easy for an artist to exhibit Gordon in an attitude scanning the far distant horizon, on the watch for the succour that arrived only when succour was unavailing. But pathetic as is the story of Gordon at Khartoum, the pathos would have been rendered somewhat theatrical so translated into statuary; the pensive attitude of the man of generous dreams is far more sympathetic—aye, and even more pathetic!

Sir Aston Webb's work has a quality all his own, though not always in evidence. Whereas in the completory buildings of the Victoria and Albert Museum, at South Kensington, the quality is not greatly noticeable, in the Victoria Memorial entrance buildings to the Processional Avenue of the Mall in St. James's Park, Aston Webb's afflatus is pronounced; to do justice to the building, however, further demolitions are required in Charing Cross, which would render the vista from either side much more satisfactory.

A few remarks must be devoted to Trafalgar Square itself. Admittedly a fine site, it has been decidedly maltreated and is but the grave of lost opportunities. Instead of making manifest its *raison d'être*, it has surrounded itself (or become surrounded) with buildings unworthy of such a site, though exception must be made in regard to St. Martin's Church. Sir Charles Barry, a notable architect, a man whose travels had carried him amongst the best examples of Continental art, and who knew so well how "to transmute into gold the leaden metal" of architecture, singularly failed in dealing with the Square. It is decidedly monotonous in the etymological sense, and "universal (greyness) broods o'er all." The fountains, we think, are out of place in a business centre, and silk hats suffer when the wind is in an adverse quarter. There is no life, no relief; the Square should have smaller ponds (no fountains), there should be trees, flower-beds, turf; and no advantages accruing from its adaptability for large open-air demonstrations, nor from its possessing the standard measures, can balance the lack of artistic qualities. And it should have noble thoroughfares heading away from it, and noble buildings enclosing it. But what can be said for Mr. A. Waterhouse's Grand Hotel, for Morley's Hotel, the Union Club, the College of Physicians, the National Gallery, on the palm of nobility? The last-mentioned building was opened in 1838 (nine years later than the Square), and in its original form it was the work of William Wilkins, though Sir James Pennethorne made additions in the sixties, and Mr. E. M. Barry added a wing in 1876. The one satisfactory portion externally is the noble portico. This fine feature compares (not contrasts) favourably with Wilkins's portico to University College, in Gower Street. For the rest—'tis but decadent art.

Before further reference to the Square's enclosing buildings, a few remarks may be offered in regard to the National Portrait Gallery, a really fine exterior by an architect of whose work too little is to be seen in London—we refer to the late Ewan Christian. The same qualities of Classic reserve are noticeable here as elsewhere in his buildings for the People's Palace at Mile End. The conjunction of the Portrait Gallery with the National Gallery was very happily effected, though the two buildings are differentiated in treatment. When we observe how the architect has shown a sense of right proportion, right disposal of ornament, right massing of features—adverse criticism, however slight, is out of place. This is one of the rare buildings, to which reference was made elsewhere, that satisfy the eye without arresting the step.

But the two Galleries provide an interesting object-lesson in contrasts within and without. Externally, the one impressive and dignified, the other mean to insignificance; internally the merits are transposed, for whereas the National Gallery exhibits a series of notable halls, the qualities of meanness and obscurity attach to the salons of Ewan Christian's building.

The Royal College of Physicians, occupying the northwest angle of the Square, is the work of Sir Robert Smirke, and is worthy of respectful notice. The Ionic portico facing Pall Mall East is eminently satisfactory, and the niched presentments of Linacre (founder of the College in 1523), Sydenham and Harvey give character to the institution; the completion of the western side of the Square by the premises of the Union Club merely continues in stucco the flank design of the College. That is perhaps not the correct description, for the Union Club is the quondam Cannon Coffee House (the work of Smirke), being converted into the club premises in the year 1823, at the time when the stone northern building for the Royal College was added.

The next structure that comes under notice here is the United University Club, in Pall Mall East; it is one that does not admit of cavilling, even were such the object of an architectural tour through the streets. In all Clubland there is no building to surpass, few to equal it. It may be supposed that some criticism of adverse nature may be possible under all circumstances, but even as in the case of the façades of the National Portrait Gallery the positive merits are so evident, and anything else so trifling, that such criticism would savour of impertinence. This club house is another instance of the good effect of ornamented construction as contrasted with both constructed ornament and unadorned nakedness. As in the case of the U.K. Provident Institution in the Strand, though from a different cause, Mr. Reginald Blomfield's club house gives the appearance of a highly ornate building, though the result is obtained in spite of a restrained use of ornament.

There is a very heterogeneous assemblage of façades in Charing Cross, nor do many of them require notice here. The Dominion of Canada seems to have made this central point of the world its home from home; here are congregated the offices for Canadian emigration and of the Pacific and Grand Trunk Railways. Of these we must confine attention to the last, where we find Sir Aston Webb once again in a happy mood. The façade has a curious but not unpleasant effect of being self-framed; the entire absence of columnar treatment may be noted with a sigh of relief, as we are not of the number of those who desire "toujours perdrix." The one disagreeable note struck in an otherwise harmonious piece is the interpenetration of arch labels and panel mouldings. The adjoining premises to the west are the offices of the Hamburg-American Line, in which we recognise thoughtful work and a refined taste; but as in some other buildings to be met with (mention was made of Temple Bar restaurant in a previous article), the heavy contrast between Labradite ground storey and white or cream stone superstructure is too pronounced; the coupled Ionic columns to the latter help towards counterbalancing this effect.

Here we must pause to enter a protest against the cult of the New Art as exemplified in neo-English architecture—the twentieth-century style, which is no style, but an agglomeration of unpleasant vagaries. Examples there are in more than sufficient number, and here we are confronted by one in "Oceanic House," and Piccadilly, Oxford Street, and Holborn furnish further instances. The columns to "Oceanic House" are pleasing, but that once conceded no more is left to concede to a building which seems to have no beginning and no end. Arrived at Pall Mall, the first building demanding attention is the Carlton Hotel, with the conjoined theatre situated in Haymarket. Mr. C. J. Phipps originated the design for the complete block and superintended the erection of the theatre, but dying ere the hotel was far advanced, the work was entrusted to Messrs. Isaacs & Florence, who made considerable alterations in the plans, though the elevational treatment was probably not greatly varied. And this is to be regretted, for it can never be a canon of art to make of an hotel a mere completory design to an existing theatre. The architecture is respectable, nothing more; but even for this we may be thankful.

Seymour House, situated at the north-western junction of Pall Mall and Waterloo Place, is a building fully worthy of laudatory notice. Mr. Arthur Thompson, the architect, has produced a good Italian Renaissance design * with a modern freedom in parts, fully justifiable in itself and fully justified by the result. The window pediments to the first floor are a bit oversteep for the best effect, however, and the building suffers to an extent from the western wing being not yet built; but that is no fault of the architect's, we may be sure. The keystone cappings to ground-storey windows are worthy of notice. The coupled columns to the entrances do not look well; single columns of increased diameter would have been a great improvement, and without the square blocks to the shafts; the rough-axed treatment to the basement windows is very effective.

Clubland is now reached, and we will first refer to the New Oxford and Cambridge at the extreme south-west, so as to dispose once for all of the nauseating façade. What architect was responsible we neither know nor care, but that such work was to come next door to Wren's might almost make one credit Sir Christopher with the foresight to set his mansion for the Duke of Marlborough as far back as possible in order to provide against future contact. There is no rest for the eye from base to crown, no sense of proportion in whole or in part—a veritable example of constructed decoration—and with this, *Vale*!

Most of the club houses are situated on the south side of Pall Mall, towards St. James's Park, and vary in their architectural as in their political and other features; but there is a directness of purpose in most of them, that is a pleasant phase of union. It cannot be pretended that Decimus Burton produced a building of any external value in the United Service Club; but stucco has a very depressing effect and reacts most unfavourably on architectural compositions. However, the Athenæum by the same architect and opposite to the United Service is a great improvement, nor does it suffer from having as a neighbour on the north side the fine block of Seymour House described above. But this may be variously accounted for; perhaps it is due to the pleasing proportions (by no means spoilt by the addition of an extra storey in recent years, for this was set well back behind the balustrade); perhaps the figure of Pallas Athene or the replica of the Panathenaic frieze of the Parthenon, or the unusual and interesting boundary walling are accountable—but the interest of the building is undoubted. The toned background to the frieze, a subdued amber, is very effective, and contrasts favourably with the treatment accorded on the façade of the Oxford and Cambridge Universities Club near the western end of Pall Mall; this also is in the stucco so much favoured in past years, and on this façade is a series of mezzo-relievo figure panels with a background of very blueish grey, giving a most crude effect. The portico of the latter club is very commonplace, and the ground storey windows mean; the brothers Smirke were the architects. They also are associated with the Carlton Club, the original building being the work of Sir Robert, and the existing one being by Sydney Smirke, contemporary in erection with the duration of the Crimean struggle. We may suitably consider the Senior and Junior Carlton Clubs simultaneously, as there is a general effect of as close kinship in the architecture as in the political colour; but there the likeness and any appropriateness of simile ends, for whereas with advance of years political exuberance tones down into a sobriety unknown to youth, in these two buildings we perceive a reverse architectural effect. The design of the Senior Club is based on Sansovino's library of St. Mark at Venice. Its main frieze is too ornate, nor is this effect counterbalanced by a sufficiently solid-looking balustrade over. But the whole façade of this club is less restful than the Junior; when regarding the latter building, it will be found that the St. James's Square façade is a finer work of art than the Pall Mall main front. This building was the work of David Brandon in 1866, with a western wing added by Mr. J. Macvicar Anderson in 1885-6; the latter architect repeated on the main front the one-storey shallow bay existing at the eastern end, and on the St. James's Square façade treated it as a two-storey bay, and these features impart a pleasing relief, which is very far removed from the restlessness of the Carlton.

But though both these buildings are real works of architecture, probably most architects will give the palm to the Reform Club which was the work of Sir Charles Barry (1837-40), who modelled it after the design of Sangallo Junior's Palazzo Farnese at Rome. At that period a fashion was in vogue to bring Italy to England, with a want of appropriateness at times that evinced a regrettable lack of the humorous sense and of the exercise of the divine art of design on the part of the various architects concerned. In Pall Mall itself attention may be directed to four such lapses (the Athenæum does not come under this category). There are the Carlton and Reform Clubs, of which mention has been made above; the Travellers, also by Sir Charles Barry (1830-2), based on Raphael's Palazzo Pandolfini and over which there is no inducement to linger; and there is the Army and Navy Club by Messrs. Parnell & Smith, based on Sangallo Junior's Palazzo Cornaro at Venice: in all these cases there is little desire to advance criticisms here, as the designs were not the work of the various architects engaged for the buildings.

---

* *The Architect*, March 11, 1904.

Of the other club houses in this thoroughfare, only two demand notice in this article—(1) the Marlborough, for its quiet domestic appearance of an Elizabethan cast, and the pleasant relief thus afforded from the Italian Renaissance so prevalent in the neighbourhood; (2) the Royal Automobile Club premises now in course of erection, but sufficiently advanced for the present purpose. The use of the colossal order necessarily has a dwarfing effect upon the storeys of a building, but after noting this, the appearance of the club is worthy of all praise, and the public may be congratulated on the substitution of this building for the miscellany of old premises that erstwhile housed the War Office. In regard to the carved ornament to the newest club-house façade, it is neither sparse nor excessive and there is a pleasing freedom in treatment far removed from straining after originality, and at the same time providing an interesting variation on the academic design so generally in evidence. A criticism may however be advanced at this place; whilst the representation of smoke, flames and jagged lightnings may be presumably typical of the disturbing elements associated with automobilism, where is the *raison d'être* of agricultural implements? for assuredly, speed limit reached or ignored, motorists cannot heed the country through which they pass; and, "when Adam delved and Eve span," where was then the motorman? The top balustrading of the club compares favourably with others, a stouter baluster being used; it needs bearing in mind that a baluster, as seen close to the eye, however satisfactory, becomes in appearance thin when raised to a height, and therefore it must be exaggerated in contour in order to look well at a distance.

As a general matter of observation, the back front of a building is less architectural than the main façade, but here in Pall Mall there are at least three exceptions. To one of these attention has already been drawn, namely, the Junior Carlton Club; another is a building by the late Professor George Aitchison, built in 1884 for the Royal Exchange Assurance Company, and situated next the above club house. The red gauged, rubbed and carved brick façade to St. James's Square is full of delicacy and interesting detail, though the Pall Mall front is also not without its good points; the entrance to the latter is worthy notice, and the carved representation of the Royal Exchange redeems to an extent what is an otherwise poor gable.

The third exception to the rule referred to a few lines earlier are the premises designed by Mr. Alfred Williams for Wilkinson's Sword Company[*] and now occupied by the Daimler Motor Company. In this case the two façades are of equal architectural value, repeating one the other with but slight modifications, and these to an extent resulting from the exigencies of the plan. The chief distinction not so resulting, but introduced so as to differentiate between back and front, is the substitution (in the upper storeys of the former) of red brick filling for the rusticated stone courses of the main façade. The central arched windows to ground storey on both faces are eminently satisfying, and the massing throughout is good; the one disturbing element on both façades is the loggia near the top, seeming in effect to wrench away the roof and its dormers from the substructure.

The last of the Pall Mall frontages to be considered are the offices of the London and Lancashire Fire Assurance Company, designed by Mr. E. Guy Dawber; this building has a somewhat elusive right of comparison with the Daimler premises described just above, but to the advantage of Mr. Dawber's façade throughout; there is the semicircular arching in each ground storey, the well-projected cornice to each, with loggia over, and there is the tripartite frontage in each case. But the differences are certainly as great as the points of likeness. Mr. Dawber's loggia treatment is guilty of no such violent effects as are Mr. Williams's, and the central lantern on the insurance building is a great improvement upon the central gable of the other. It is perhaps a trifle, but yet it is interesting to note the lesser height of the central arch of ground storey in Mr. Dawber's building, being the entrance to a foot thoroughfare of meagre dimensions, and thus suitably dealt with in the design.

The next buildings demanding notice bring within our ken the most interesting of living architects, Mr. R. Norman Shaw, and this opportunity may be taken for correcting an error of which the article on the Strand was guilty; for on reliable authority (not Mr. Shaw's own, however, be it understood), we have been informed that the external design for the offices of the Government of Victoria (Australia) is the work of this eminent architect in all its main features, and to this extent it is necessary to revise what was said in the earlier article. Here, at the corner of Pall Mall and St. James's Street, is a building erected several years ago by Mr. Norman Shaw for the Alliance British and Foreign Life and Fire Assurance Company; the ground storey arching here is entirely satisfactory, not lacking the sense of right proportion such as was observed in the Victorian offices. The bold gables and angle turret, the well-disposed carving, the distribution of stone bands over the red brick façades all combine to produce a fine office block, that at the date of its erection did not have so many worthy companions as at the present day. On the opposite side of the street are the more recent offices of the Alliance Assurance Company, the joint work of Mr. Norman Shaw and Mr. Ernest Newton; it is good work, but not as pleasing as the earlier building; the pulvinated rustication, which is a feature growing in favour, is not to be commended; it gives an air of softness where there should be nothing but strength. The iron balcony fronts are good, and masses are well judged. Mr. Frank T. Verity's block of mansions in Cleveland Row compares well with the last-named building, and is very fitted for its purpose, so far as the design can express it; there is a suggestion of similar ideas bearing influence in both buildings, though this is doubtless accidental.

At the commencement of this article some remarks were offered respecting St. James's Palace, and at this place it will be convenient to refer to some of the private mansions situated within and near its precincts. Of Stafford House but few words are necessary; it was built by George III.'s second son, the Duke of York, on Crown land, at a cost of 72,000*l*., with money lent by the Marquis of Stafford, the architect being Benjamin Wyatt. The Duke died before the house was ready for occupation, and the Crown lease was subsequently sold (in the year 1841) to the Marquis for the amount of the above loan. Sir Charles Barry added the upper storey, and was architect for much of the interior; architects will have an opportunity later on in the year of inspecting this nobleman's palace, on the occasion of the Town-Planning Congress—an opportunity that has not occurred since the International Congress of Architects held in London four years ago. The exterior of the house is not at all architectural, and we need not linger over it, nor over Clarence House just opposite, built for the Duke of Clarence, afterwards William IV.

When we turn to Bridgewater House, we are confronted by a thoroughly fine specimen of architecture, the work of Sir Charles Barry in 1849. It has a family connection with Stafford House, for Lord Francis Egerton (second son of the Marquis of Stafford and created Earl of Ellesmere) was great-nephew and heir to the Duke of Bridgewater, who left his valuable collection of pictures to his nephew the Marquis of Stafford (first Duke of Sutherland), with remainder to Lord Francis. On the death of the Duke of Sutherland, the new owner of the pictures had the present Bridgewater House rebuilt on the site of what was once known as Berkshire House, afterwards as Cleveland House, and then as Bridgewater House, built by the first Duke of Bridgewater in 1730. Barry's mansion is a palatial pile, within and without, and is almost beyond criticism of an adverse nature; this also will be available for inspection in the autumn; we went over both Bridgewater House and Stafford House four years ago and hope to renew acquaintance this year. The lintels to first floor windows have an unusual decoration in the form of a motto "Sic donec" in the centre of each. The forceful chiselled lettering over the portico "Restitute Anno Domini MDCCCXLIX," is worth attention; the alternate plain and vermiculated drums of the columns to the portico are also effective.

Spencer House is not possessed of any specially attractive external features. It was built in the fourth quarter of the eighteenth century, John Vardy being architect for the Green Park façade, and James Stuart (of Grecian fame) for the entrance front in St. James's Place. The statues on the pediment, where one is accustomed to see modest acroteria, were the work of M. H. Spang; the ground storey park façade is arched and rusticated, and there is a superstructure with Doric order, and a frieze showing in alternate metopæ the absurd bucrania or ox-skulls; but as there is no inducement to linger over the description of an uninteresting building, we will here stay our wearied pen.

---

[*] *The Architect*, Feb. 26 and March 4, 1904.

REFORM OF BUILDING BYE-LAWS.

THE Council of the Rural District Councils Association in their annual report refer to the draft Public Health (Building Bye-Laws) Bill as follows:—

The Council considered this Bill submitted to them by the Building Bye-laws Reform Association in pursuance of the Conference between the representatives of that Association and a Sub-Committee of the Council held on January 20, 1909.

The Council were of opinion that Clause 2 of the Bill, in so far as it proposed to enable the County Court to order the plan to be approved without modification or subject to any modification specified in such Order or to make such other Order as the Court shall think just, went beyond the agreement come to with the representatives of the Building Bye-Laws Reform Association, which merely contemplated a right of appeal to the County Court on the question of whether or not the plan complied with the bye-laws, and was merely intended to substitute the less expensive procedure of appeal to the County Court for the present procedure by *mandamus* to the High Court.

They ultimately decided that provided Clause 2 of the Bill was altered to confine the appeal to the question of whether or not the plan as submitted complied with the bye-laws, that the Bill would substantially carry out the arrangements come to at the Conference between the representatives of the two Associations on January 20, 1909, and a communication to this effect was addressed to the Secretary of the Building Bye-Laws Reform Association.

TOWN PLANNING.*

I FEEL it a great honour to have been asked to address this Conference of Rural District Councils on this subject, as it is one which I think the delegates present will have more to do with than almost anybody.

The recent Census statistics reveal the existence of a strong tendency for population to shift away from busy centres to more rural surroundings outside, where it is possible for a man after his day of toil to recuperate amidst pleasant surroundings, and where his family can have permanent enjoyment of cleaner air and more spacious quarters. The result of this growing tendency must be the gradual spreading of our towns, so that our rural districts will become urbanised. In the process the towns must either enlarge their boundaries to the detriment of the rural districts, or the Rural District Councils must provide the amenities, convenience, and sanitary conditions necessary for a town population, and co-operate with the towns which they adjoin in anticipating future development.

Having this in mind, one feels that the Town Planning Act was passed in order to benefit rural districts almost more than any other form of district or borough. The weakest part of the Act is that it hardly provides enough machinery for rectifying existing wrongs, but this weakness will be least felt in rural districts, because in most of these the greatest development is yet to come.

That the development as it comes should be on right lines is of the greatest economical importance to the district, and within the Town Planning Act will be found considerable powers to make this possible.

We have heard a great deal of the social, moral and physical benefits to be derived from town planning, and they are indeed important, but reformers have been rather apt to overlook their biggest asset, viz., the great economical advantages attached to it.

The average ratepayer, and he is after all the party of principal importance as matters stand, will let you talk of the first three assets until you are blue in the face, and it is not until he hears that number four is sound that he will begin to take notice.

Finance is the ruling factor, and in our brief examination of the possibilities opened up by the Act, that is the thing we must bear most closely in mind.

Probably we are all agreed as to the desirability of town planning—we have all seen too much of the disastrous results of the haphazard planning of our towns not to be impressed with the wisdom of exercising wise foresight, now that the Town Planning Act has made such a course possible, and provided that the Act has placed such powers within our means financially.

In urban districts, and many rural districts in which there are urban developments, one has so often seen good property spoilt by the bad development of adjoining estates, and good property spoilt, as we all know, means loss to the rates. Again, we all know the heavy sums that have been spent on street improvements, which a very little wise foresight might have avoided, and it is well for us to remember that the urban problems of to-day are the rural problems of to-morrow.

The responsibilities of the rural district are, indeed, perhaps even greater than the urban, as she is the mother of many parishes that will themselves some day burst into urban powers, and it should be a matter of maternal pride to see that the days of their maturity are not marred because of a bad upbringing.

The Act itself we are all pretty familiar with, but one may perhaps briefly recapitulate its main town planning provisions.

The gist of the matter is in the first section of Part II.:—

"54 (1) A town planning scheme may be made in accordance with the provisions of this part of this Act as respects any land which is in course of development, or appears likely to be used for building purposes, with the general object of securing proper sanitary conditions, amenity, and convenience in connection with the laying-out and use of the land, and of any neighbouring lands."

"(2) The Local Government Board may authorise a local authority within the meaning of this part of this Act to prepare such a town planning scheme with reference to any land within or in the neighbourhood of their area, if the authority satisfy the Board that there is a *prima facie* case for making such a scheme, or may authorise a local authority to adopt, with or without any modifications, any such scheme, proposed by all or any of the owners of any land with respect to which the local authority might themselves have been authorised to prepare a scheme."

In order that there may be no fatal finality, it is also provided by Sub-section 6, "A town planning scheme may be varied or revoked by a subsequent scheme prepared or adopted and approved in accordance with this part of this Act, and the Local Government Board on the application of the responsible authority, or of any other person appearing to them to be interested, may by order revoke a town planning scheme if they think that under the special circumstances of the case the scheme should be so revoked."

Also, in order that schemes may be comprehensive, and not divided by purely parochial boundaries, we have the following valuable provision:—

"55 (3) Where land included in a town planning scheme is in the area of more than one local authority, or is in the area of a local authority by whom the scheme was not prepared, the responsible authority may be one of those local authorities, or for certain purposes of the scheme one local authority, and for certain purposes another local authority, or a joint body constituted specially for the purpose by the scheme, and all necessary provisions may be made by the scheme for constituting the joint body and giving them the necessary powers and duties."

An authority may, without compensation, insert provisions in a scheme, which with a view to securing the amenity of the area included in the scheme or any part thereof, prescribe the space about buildings or limit the number of buildings to be erected, or prescribe the height or character of buildings, and which the Local Government Board, having regard to the nature and situation of the land affected by the provisions, consider reasonable for the purpose.

Also, no compensation is payable in respect of any provisions which would have been enforceable if they had been contained in bye-laws made by the local authority.

With regard to this, one must recognise the wisdom of Liverpool, which has in its own bye-laws a provision that for main thoroughfares 80 feet roads may be insisted on.

And most important of all, directly application has been made, after proper notice for authority to prepare a scheme, no compensation is payable on account of any building subsequently erected, or contract entered into with regard to land included in the scheme.

As we know the local authorities who must deal with this matter are "The Council of any borough or urban or rural district," their expenses shall be defrayed as expenses under the Public Health Acts.

---

* A Paper read by Mr. G. L. Pepler, F.S.I., at a meeting of Rural District Councils of England and Wales at the Guildhall, London, July 6 and 7.

The matters that may be dealt with in a Town Planning scheme are set out in the Fourth Schedule, and the principal ones are as follows:—

1. Streets, roads, and other ways, and stopping up or diversion of existing highways.
2. Buildings, structures, and erections.
3. Open spaces, private and public.
4. The preservation of objects of historical interest or natural beauty.
5. Sewerage, drainage, and sewage disposal.
6. Lighting.
7. Water supply.
8. Ancillary or consequential works.
9. Extinction or variation of private rights of way and other easements.
10. Dealing with or disposal of land acquired by the responsible authority or by a local authority.
11. Power of entry and inspection.
12. Power of the responsible authority to remove, alter, or demolish any obstructive work.
13. Power of the responsible authority to make agreements with owners, and of owners to make agreements with one another.
14. Power of the responsible authority or a local authority to accept any money or property for the furtherance of the object of any town planning scheme, and provision for regulating the administration of any such money or property, and for the exemption of any assurance with respect to money or property so accepted from enrolment under the Mortmain and Charitable Uses Act, 1888.
15. Application with the necessary modifications and adaptations of statutory enactments.
16. Carrying out and supplementing the provisions of this Act for enforcing schemes.
17. Limitation of time for operation of scheme.

Having regard to the savings that we all know can be effected in these matters if they can be provided for ahead and not made to fit in when development is completed, and considering that as against any possible compensation may be set "betterment," of which the Authority takes half, I think it is quite clear that to town plan a growing area should in most cases cost little more than that paid for the actual technical work. There is also no doubt that the ultimate saving to the Authority, apart from added amenity and preservation of rateable value, will be considerable.

The Act makes very ample provision for conferences with owners, and as it is so important to large owners that some general scheme should be arranged, it is probable that in many cases the initiative will come from them; or, as at Ruislip, the fact of the development of a large estate being contemplated, will perforce make the Authority consider town planning in order that proper through communications may be provided.

It is quite easy to make most large landowners see that it is to their interest that main roads through their property should be wide, and in nearly all such cases, I think, the land will be willingly given. The difficulty will be where there are a number of small owners to whom a wide road is not of much advantage, but even in these cases expenses can be avoided if only the problem be tackled in good time.

The Local Government Board Regulations are a further incitement to speed. They provide such careful safeguards so that no interest may be ignored or overlooked, and of necessity the observance of these safeguards must take so long, that it is clearer than ever that a start should be made at once.

These regulations have met with some objection, but if one studies them closely and takes them consecutively, it becomes apparent that first appearances are deceptive, and the task not nearly so formidable as appeared at first sight, although there is room for simplification. Probably in the course of time the Local Government Board may see its way to simplify the procedure. If this can be effected in the first stage, no doubt it will lead to greater activity on the part of small authorities. There are sufficient safeguards in the second stage to make it quite feasible, without injuring the interest of owners, to reduce the procedure in the first stage to the absolute minimum required by the Act.

The Town Planning Review of April this year contained a very clear sample application under the Act, with the necessary maps, and makes the procedure most easy to follow. I have personally prepared a case for the owners of an estate at Middleton, and with the very kind co-operation of the Town Clerk and Surveyor, we have reached the application stage without any very soul-stirring or harassing episodes.

I imagine that in rural districts the cost of preparing a scheme would be apportioned among the parishes concerned, and one knows that a very little expenditure makes 1*d.* rate, but it is only a very little expenditure that need be necessary.

The Local Government Board have made it clear that great detail is not essential; seven maps are certainly ultimately required, but they need not be very formidable productions.

Map 1 is only an ordnance map with the area to be planned coloured on; in map 2, which accompanies the application to the Board, one need only show the most general outlines of direction of any proposed routes for roads, on the 2,500 ordnance.

Map No. 3 is again a coloured ordnance map only.

These are all the maps that need accompany the application, and the later maps are amplifications of these made clear as the matter proceeds.

Map No. 1 should at least include all the area likely to be wanted for building during the next twenty or thirty years, and it is of the utmost importance that this should be prepared at once and the necessary notices served, because after that two months at least must elapse before application can be made to the Board.

During this two months, or more, further attention can be given to Map No. 2, and it is important for this map that the Surveyor should have a pretty complete general idea of the main lines of the scheme; the more detailed lay out will no doubt be evolved and amended as the enquiry proceeds.

The problems to be faced will require most careful study and attention, but once a scheme has been evolved, the authority and its officials will have their reward in being prepared whate'er betide, and in not being at the mercy of every small estate developer who in the ordinary course can force on them his plans as long as they comply with the bye-laws, however undesirable they may be, and whatever seeds of future trouble they may contain.

All Town Planning Authorities should have their Town Planning Committees, and as I have heard of appointed committees who hardly knew on what to begin, I have ventured to compile the following suggestions as to matters to which they might immediately turn their attention:—

1. The first thing I should suggest, as it appeals to the ratepayers' point of view, is that the committee should consider what good property in the district is threatened by bad development in the proximity, and the best way generally in which good development can be encouraged and existing good development preserved. An illustration of this: The Croydon Corporation recently acquired a strip of land to beautify a road, not on account of the estate from which the strip was taken, but in order to prevent depreciation of property beyond. Several thousands of pounds were spent there, which would have been greatly reduced if the Act had been then in force and action had been taken under it.

2. To bring the plan of the district up-to-date, marking on the new roads finished or commenced.

3. Review the plans deposited but not approved, and also plans approved but not yet carried out, to see if there is not urgency to apply for powers in order to check undesirable development.

4. To consider the question of intercommunication with other districts, and whether a joint conference is desirable.

5. To consider the trend of development, the land likely to be next developed, and the desirable way in which it should be developed.

6. To consider the needs of intercommunication, and also as to road improvements that might not now be too expensive under the new powers the Act gives as to betterment, &c.

7. In some places it might be of great value to have traffic charts prepared, in order to show the trend of traffic, and if any relief roads had already been constructed in the district, to consider whether they had answered their purpose.

8. The very important question of open spaces: to see how far existing ones answer their purpose, and what are likely to be required in the future, and whether combination with an adjoining authority might not be desirable in this matter. Also to note any places of historic interest.

9. To consider on what lines the development of the district has so far proceeded, and as to what areas can therefore most easily be retained and improved for various classes of property.

10. To consider whether the assistance of the Road Board might not reasonably be requested.

11. To study present bye-laws, and see whether in some respects they might not be reasonably amended to make cheaper the construction of some types of roads and houses.

As to the methods of planning, it is difficult to generalise, as each district must be treated on its own merits, according to its climate, contours, and customs.

On the Continent they seem ever to be at one extreme or the other; first they were all for formal planning, now they are mostly for informal. First the grass-bordered ring-road was the thing, now it is the turn of the parkland wedge.

It is to be hoped that in this country we shall avoid these extremes, and that having Continental experience to draw upon, we shall steer an even course, judging each case on its merits, and not identifying ourselves entirely with any school except those of common sense and high ideal.

Certainly in rural districts one would expect to find mostly an informal type of plan, and not one of broad, straight streets laid out to a geometrical pattern, and this should certainly be so in districts where the ground is very undulating.

On the other hand, in growing centres of population, and where levels assist, the formal type of plan may be the best, having regard to the growth that is likely, and to the shopping centres and municipal buildings that will be required.

Two possibilities should ever be borne in mind: (1) the arrangement of a good approach to the railway station and the linking up of roads thereto; (2) the reservation of land in a good position for important buildings likely to be wanted in the future, such as town hall, baths, assembly rooms, &c. You have only got to go to Cardiff to see what a magnificent opportunity these buildings afford if properly grouped and with sufficient space. Other simple rules are (*a*) preserve all trees, water-courses and walks thereby, and fine old buildings that you can; (*b*) in arranging the allotment of areas for buildings of various characters, place those likely to create smells as far as possible to leeward of your district, having regard to prevailing winds.

As regards some portions of the area, it may not be advisable to do more than include regulations as to the character of the buildings and the number to the acre that should be allowed.

In a town planning scheme, a uniform width of road is undesirable, and in this, and possibly in some amendment of building bye-laws, with reference, say, to heights of rooms, an opening may be found for concessions to owners which will cause them more readily to fall in with the general scheme as it affects their lands.

With increasing road traffic, the tendency will be to form first-class highways to attract fast vehicles, and to which residential property will not be faced, but will be placed on subsidiary roads which are purposely arranged to discourage use of them by fast through traffic.

One could go on almost indefinitely discussing the many points that one constantly meets in dealing with this most interesting and important subject, but perhaps I have said enough to draw fresh attention to the matter as it affects rural districts.

There are many rural districts that, while still rural in character as well as in name, are bound to be invaded in the near future by the outward thrust of population from the large towns, and it is therefore of paramount importance that the local authorities of those districts should avail themselves without delay of the opportunity offered by the Housing, Town Planning, &c., Act to lay down such a plan as will not only prevent undesirable development by the jerry builder, but will ensure that the existing amenities of the district shall as far as possible be preserved.

Prevention is better than cure, and to the rural districts more than any other body the better course is open.

STAINED GLASS IN A JEWISH SYNAGOGUE.

A COMMENCEMENT has recently been made to decorate the Hammersmith and West Kensington Synagogue, situated on Brook Green, with stained-glass windows, in accordance with a scheme of design which is being prepared by Mr. Percy L. Marks, architect, of Imperial Buildings, Ludgate Circus. The ritual objection existing amongst orthodox Jews to the decorative introduction of the human figure necessitates specialised treatment. For the six windows at present in position four designs have been employed. The largest window (a lunette of nearly six feet radius, situated at the East end over the Ark) represents the giving of the Ten Commandments; the treatment shows the two tables of stone (bearing in Hebrew characters the introductory words of the several commandments) issuing from a thunder-cloud, which overspreads a brilliant dawn, which, with the half-risen sun, indicate the early hour when the solemn function is supposed to have taken place. Two pairs of narrow lights (one being in petto and one pair being much larger) illustrate the verse "The righteous shall flourish like the palm-tree, He shall grow like a cedar in Lebanon," the palm-tree and the cedar each severally appearing in a long and a short window. The sixth window of the series is a memorial to the late Minister of the congregation, the Rev. S. Alfred Adler; the upper light exhibits an eagle in proper colours on a lofty peak, with wings extended in the action of imminent flight; in small spandril medallions are shown the priestly hands in the attitude of benediction, indicative of the fact that Mr. Adler was of the tribe of priests. The sub-transome light shows a geometrical design in harmonious colouring, four intersecting circles being enclosed in one large circle, the spandril spaces showing severally the roses of York and Lancaster and the shamrock and thistle, the idea being to symbolise brotherhood and patriotism. A suitable Hebrew verse (Is. xl. 8) and an English memorial inscription complete the design. Messrs. Campbell & Christmas, of St. Oswald's Studios, West Brompton, executed all these windows under the direct supervision of the architect.

LIABILITY OF PROMOTERS OF A COMPETITION.

AN interesting case arising out of a proposed competition for designs for a parish church hall at Kendal, against the conditions of which the local architects protested, came up for consideration on Tuesday, July 11, by a King's Bench Divisional Court consisting of Mr. Justice Bray and Mr. Justice Bankes. The matter came before their lordships upon an appeal by Mr. John Stalker, jun., a young architect whose father was amongst those who protested against the proposed conditions. When the competition was withdrawn, however, Mr. Stalker, jun., brought an action against Lafone and others for breach of contract. The Kendal County Court Judge entered judgment for defendants with costs, and against this Mr. Stalker, jun., now appealed.

Mr. McCleary, for the appellant plaintiff, stated that the defendants were a committee appointed to carry out the purchase of a site and approve plans for the purposes of a parish church hall at Kendal, and this committee inserted an advertisement in a Westmoreland paper in the following terms:—

"The Committee invite architects practising in Kendal to submit competitive designs, together with written descriptions and estimates, for the erection of a Church Hall on the glebe land.

"A premium of £10 is offered for the design considered by the committee first in order of merit, and a prize of £5 for that considered second. Such designs, on payment of the premiums, shall become the absolute property of the Committee."

"All designs to be sent in not later than March 31, 1911."

By the conditions of the competition which were sent out later to the architects, the Committee did not bind themselves to employ for carrying out the work the architect who got the first prize, but stated it as their intention to do so. Further, they announced that the designs of all competitors would be on exhibition after the award for one week.

Plaintiff at once set about preparing plans, and did about three weeks' work. Then he was surprised to see another advertisement saying that the competition would not be held owing to a protest received from the architects practising in Kendal.

It appeared that during this time some architects did not think it was going to be a very fair competition, and they drew up the following protest:—

"We should point out to the Committee that the conditions sent to us neither form the basis of a fair competition nor present any guarantee of impartial assessment of the designs by a qualified assessor; also the particulars furnished are insufficient and the premiums inadequate and out of proportion to the amount of labour and expense entailed."

In consequence of that the competition was withdrawn and the work was given to a gentleman who had signed the protest and who was also a churchwarden. Mr. Stalker, however, had received no notice of the meeting at which the protest was passed. The advertisement was a public offer, and plaintiff, by commencing work, accepted that offer. Therefore there was a binding contract to hold the competition and give Mr. Stalker, jun., an opportunity of displaying his designs and perhaps winning one of the prizes. If the Committee withdrew the competition they were liable in damages, Counsel submitted.

The notes of the proceedings at the County Court were then read, and from these it appeared that Mr. Stalker, jun., worked in his father's office, and that the conditions of the competition were not sent to himself direct, but to his father.

The County Court Judge, in giving judgment for the defendants, said that the damages were far too remote.

Mr. Justice Bray: The County Court Judge, I see, has found that Mr. Stalker, jun., was not an architect practising at Kendal. If that was so, there was no contract.

Mr. McCleary contended that there was no ground for any such finding.

Mr. Justice Bray: I don't know. Plaintiff, in his evidence, said, "I am assistant to my father."

Mr. McCleary: In addition to that he says, "I have made plans for a house and other buildings, and have competed in competitions. I gave particulars of the work he had done to another architect practising at Windermere, and I called and I asked that gentleman, Would you describe him as an architect?" He replied, "Yes."

Mr. Justice Bankes: But the Judge did not accept that.

Mr. McCleary: The evidence was that he had practised in Johannesburg, and done architect's work in Kendal at the same time as he was assisting his father.

Without calling on Counsel for the other side, the Court dismissed the appeal.

Mr. Justice Bray, in giving judgment, said the offer alleged in this case was one made to architects practising in Kendal. The question of whether Mr. Stalker, jun., was an architect practising at Kendal was a question of fact, and the County Court Judge had found it against the plaintiff. He had found in effect that there was no offer to the plaintiff. In his Lordship's opinion there was no evidence before the County Court Judge which compelled him to find in favour of the plaintiff. He had found in favour of the defendants, and consequently the plaintiff's appeal must fail.

Mr. Justice Bankes agreed.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

SECOND REPORT OF THE JOINT COMMITTEE ON REINFORCED CONCRETE.

THE Joint Committee on Reinforced Concrete have now completed their second report, and it will shortly be on sale at the Royal Institute of British Architects.

In an introductory note the Committee state that since the issue of the first report in 1907 the use and knowledge of reinforced concrete for architectural and engineering constructions have steadily increased. It therefore appeared desirable that it should be reconsidered in the light of further experience, and this second report is the result of the committee's labours. The section on materials has been modified in certain details. The section on methods of calculation has been recast in form, and the standard notation (proposed by the Concrete Institute) has been adopted. The sub-section on columns has been revised and the formulæ proposed have been re-cast, so as to include the cases in which the lateral or helical binding is a material factor in the strength. The suggestions which have been made from time to time by institutions and individuals have been of much value, and have been fully considered.

Professor Unwin, F.R.S., Captain J. Gibson Fleming, R.E., and Messrs. Wm. Dunn and E. Fiander Etchells contribute appendices. The size of page has been reduced for convenience of handling, and the work will be issued in stiff covers at the price of 1*s*.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) contains reproductions of plans, working drawings and photographs of the Rockland County Trust Company's offices at Nyack, New York, Mr. Donn Barber, architect; the R. A. Long building, a skyscraper at Kansas City; and a school building at Walkerville, Ontario.

The *Architectural Record* (New York) for this month is a "Southern Number," and contains articles on the Old and the New South, in which early and modern architecture are compared; on the Southern colleges in the series on the Architecture of American Colleges; and also an article on Old and New Orleans, with reference to the picturesque buildings of the French and Spanish régime.

Engineering Record (New York) contains an account a Japanese test of a reinforced concrete floor panel by t city engineer of Yokohama, and an abstract of a paper l Mr. George C. Whipple read before the American Wate Works Association on "Hot-water Troubles."

Arkitektur og Dekorativ Kunst (Christiania) contains a illustrated article on the exhibition to be held next year o the island of Hovedoen.

La Construction Moderne (Paris) gives illustrations an descriptions of the *Foyer de la jeune fille* at Nancy, a host for young women. There is also an article on the Templ of the Sun at Baalbec, making comparison between it an Egyptian temples.

Deutsche Bauzeitung (Berlin) is publishing a series articles on crematoria, and now deals with that at Dessa and the columbarium in the Gericht-strasse at Berlin. Con petition designs are illustrated for a new central railwa station at Stuttgart and for a bridge over the Moselle a Treves.

Moderne Bauformen (Stuttgart) illustrates a large countr mansion near Annaberg, of which Dr. Otto Schulze-Kolbitz i the architect, and the interior of the officers' mess-buildin of the 1st Foot-Artillery Regiment at Munich. The numbe also contains illustrations of several smaller country house and coloured plates of internal decoration.

Correspondence

[The Editor will not be responsible for the opinion expressed by Correspondents.]

Sirapite Plaster.

SIR,—We have an interesting letter from a plasterer i New Zealand who is in charge of the building or the plaste ing of a new theatre there which is being plastered wit our Sirapite plaster. He states the wages in Wellingto are £3 12*s*.; he himself is being paid £4 10*s*. per week t "look after the job," but what we particularly though would interest your readers is the following extract fro his letter:—"We are starting the ceiling 800 yards nex week and are laying the first coat on from the top of th laths. There is plenty of room between girders and th roof and we thought it would not drop about so, neithe so much go through the key. I don't know if that has bee tried in England, but I think it is a good idea where it ca be done."

We have never heard of this method of plastering; i would be interesting to know the views of your reader plastering this way, or if any builder or plasterer has ha any experience of this method.—I am, Sir, yours truly,

The Gypsum Mines, Ltd. Thos. J. Collins.

Bournville Village.

SIR,—As the paragraph relating to Bournville, in you issue of the 7th inst., is liable to lead to misunderstanding, shall be greatly obliged if you will kindy allow me to mak one or two comments respecting it.

With regard to rents, these are never raised during tenancy, but when a house changes hands the rent is recon sidered and raised if it seems necessary, but it is obviousl incorrect to say that it is raised in all cases. The whol income of the Trust goes to helping forward housing condi tions at Bournville and elsewhere, and the Trust i therefore conducted upon business lines. This being so th rents are fixed on a commercial basis, and the tenant prefer this to being in any way indebted to charity. Al though there are plenty of houses to let in the surroundin districts there are often twenty or thirty applications fo any house belonging to the Trust that may become vacant This, it may fairly be argued, is an evidence that the rent are not excessive. About 82 per cent. of the inhabitant are artisans. The Trust is under the final control of th Charity Commissioners, and the balance sheet is submitte to them every year, thus securing that the purpose of th founder shall be fulfilled. No trustee receives any pecuniar benefit from the scheme.—Yours truly,

John H. Barlow,
Secretary.

Bournville Village Trust.

FORTHCOMING EVENTS.

Saturday, July 22.

Society of Architects : Sketching Party's visit to Oxford.

Institution of Municipal Engineers : Annual Meeting of the Eastern District at Yarmouth.

Edinburgh Architectural Association : Annual Excursion to St. Andrews.

Monday, July 24.

Builders' Benevolent Institution : Annual Meeting at Koh-i-Noor House, Kingsway, W.C.

Tuesday, July 25.

National Federation of Building Trades Employers of Great Britain and Ireland : Half-yearly meeting at Newcastle-on-Tyne (three days).

Royal Archæological Institute : Summer Meeting opens at Cardiff (closes August 2).

Thursday, July 27.

Guild of Architects' Assistants : Visit to Royal Academy of Music, Marylebone Road, N.W. (Messrs. Ernest George & Yeates, architects).

Nottingham Architectural Society : Annual Excursion to Windsor.

ST. PAUL'S BRIDGE.

THE report by the three eminent architects, Sir William Emerson, Mr. T. E. Collcutt, and Mr. J. J. Burnet, who were consulted by the Bridge House Estates Committee of the Corporation, and which we published in our last issue, must be taken by all fair-minded critics as a complete justification for the scheme put forward by the Corporation on every point, taking for granted the purposes for which the new bridge is to be constructed.

In the first place, St. Paul's Bridge is intended to provide a new main line route of traffic between north and south London, intermediate between London Bridge and Blackfriars Bridge, and particularly for a junction between the tramway systems of north and south. Personally, we do not admit the necessity of such a connection, but it is an essential condition of the problem presented to the three eminent architects who have been consulted. It has been suggested in the *Times* that an improved Southwark Bridge and a new road traffic bridge at Charing Cross would better meet the requirements of transit between north and south, but obviously this would not comply with the desideratum of a through tramway service without very great additional expense and diversion of the existing systems.

Thus the tramway service is at the root of the whole question, and given this as a governing factor in the problem we admit that the consulting architects could not do otherwise than approve the scheme proposed by the Corporation. A subway for tramcars at the east of St. Paul's Cathedral may be dangerous, and probably is, but one on the south is regarded by Mr. A. J. Barry, Mr. Basil Mott, and Mr. Mervyn Macartney as, in the words of the latter, "too dangerous to be even contemplated." Hence, as a traffic route is desired between north and south London, comprising as an essential feature the construction of a subway for tramcars, one can understand and appreciate the decision of the consulting architects in favour of the scheme of the Bridge House Estates Committee. What would have been the decision of the three eminent architects if there had been no tramways to consider it is perhaps futile to speculate, but we certainly think that no satisfactory case has been made out for the necessity of the through tramway connection. This has been taken for granted, and the postulate governs the whole question.

We next come to the consulting architects' decision as to the desirability of a vista for the bridge terminating in a view of St. Paul's dome or of the scheme proposed by the Corporation. We cannot help thinking that, having already decided that the traffic problem could only be solved by the Corporation's scheme, the consulting architects were ready to consider the views afforded with a certain amount of bias. We must, however, accept their judgment, which appears to rest on three distinct points: first, that a direct view of the south side of the cathedral is not desirable; second, that improved views of the east end, which would be afforded by the Corporation's scheme, are not only preferable, but in themselves desirable; third, that the proposed vista would necessitate a skew bridge over the river, and for this it would be almost impossible to make a satisfactory monumental design in masonry, but the skew bridge would probably have to be constructed in steel.

Everyone may not be prepared to admit the correctness of the judgment that a direct view of the side of the cathedral is not desirable. Some will traverse the reference to the superficial ornamentation of the wall surfaces of the south elevation by urging the importance of the dome and the south porch, but the relative prominence given to the various elements of Wren's design is a matter of taste and judgment, and therefore the judgment of those to whom the question has been referred must be accepted. They are the appointed arbiters and their decision must be regarded as final.

There can be no question that by the Corporation scheme improved views of the east end of the cathedral will be opened up, and these would be rendered still more effective by the adoption of the suggestions made by the consulting architects of increased space next Old Change and Cannon Street. No doubt these improved views were considered to offset the loss of the vista entailed by the abandonment of the skew bridge line of view. Here, again, we have a question of pro and con. Some may prefer the vista leading up to the dome and south porch of the cathedral; others may attach more value to the new views from north-east and south-east, and the judgment of the referees must in this conflict of taste also be accepted without question.

Last of the three main points on which the consulting architects' decision appears to have been based is their objection to a skew bridge. That such a bridge could not be the subject of a satisfactory monumental design in masonry is a dictum that must be received with respect by reason of the quarter from which it comes, but it seems rather to imply that a monumental design must be symmetrical, which is not altogether an incontrovertible proposition. It is to be noted that Mr. Collcutt expressed his separate and individual opinion "that it would be possible to construct a bridge over the river giving a vista of St. Paul's," which he would prefer, "if found practicable." As Mr. Collcutt joins his colleagues in their report, it is to be assumed that, for other reasons than the difficulty of construction, it is not practicable to adopt the vista scheme. Mr. Collcutt does not traverse in his separate opinion the statements that the skew bridge would not be monumental and would probably have to be constructed in steel.

The consulting architects disclaim that it was "part of their duty to examine with care the financial aspects of the conflicting schemes which have been the subject of public discussion," and seem to have accepted the view put before them that the vista scheme "would involve altogether heavier expenditure, out of all proportion to the Corporation project." Having decided on other grounds that the "Corporation project" was superior to the vista scheme, it is perhaps scarcely to be expected that the consulting architects should examine with care the financial aspects of the latter or other schemes, and it must be admitted that the advocates of opposition schemes to the Corporation project have not tendered any evidence as to the cost of their proposals. St. Paul's Bridge, as projected by the Corporation, is estimated to cost £1,646,983, a very definite figure. Equally definite figures are wanting for the several opposition proposals. Hence their proposers could not expect that the referees should give them credit for superior financial advantages or even equal practicability with the Corporation project.

There still remains the question of the design of the fabric of the bridge and its approaches after the decision that the general lines of the Corporation project are to be adopted, and the consulting architects naturally enforce the view that the designs for the bridge, the archways over Queen Victoria Street and Thames Street, and the approaches as well as the accesses from the higher and lower levels and the debouchment of the roads should be the subject of collaboration between architects and engineers. One can scarcely suppose that there will be any opposition to this view on the part of the Corporation, and if the conditions are not framed in too niggardly a spirit there is still hope for the realisation of a bridge that shall be a credit to the City of London.

NOTES AND COMMENTS.

The selection now made of the site for London's memorial to King Edward VII., at the Piccadilly end of the Broad Walk in Green Park, will not, of course, please everybody. The only real objection that we can see is that it is a little out of the way, but if the memorial is in itself of sufficient importance this objection is minimised, as it will be sufficiently obvious to invite inspection. The St. James's Park idea having been abandoned, the chief competitor with the selected site seems to have been the Charing Cross side of the Admiralty Arch. This latter suggestion bristles with difficulties. A memorial here would conflict with the Nelson column and be difficult to arrange in consonance with the Admiralty Arch and the street levels.

University College, London, is promising excellent developments next session in relation to architecture. The higher course of advanced design, somewhat on the lines of the Ecole des Beaux-Arts at Paris, under the direction of Mr. J. J. Burnet, opens up for English students opportunities not hitherto available in this country for the study of the art of architecture. On the other side of architectural work, the systematic study of heating and ventilation is a branch of practice that has hitherto received too little attention from architects, who have for the most part been content to entrust schemes for their buildings to firms of tradesmen who have something to sell, and hence are not likely to consider each individual problem on its own merits and without bias. No one system of heating or of ventilation is universally the best for every building, and any attempt to maintain the contrary proposition savours of quackery as much as the recommendation of any particular pill or potion as an infallible cure for all diseases.

A sad accident at the Co-operative Wholesale Society's premises in Balloon Street, Manchester, points out the necessity for most careful examination of all wire ropes connected with machinery, and particularly, as in this case, with lifts. The deceased with two other men went to examine steel wire ropes, as to the condition of which there was clearly some doubt, for one of four had been removed for repairs and the other three were under examination when they broke. Wire ropes are very apt to deteriorate in strength and to give way suddenly, and should never be trusted for a lengthy life even if actual signs of failure are not apparent.

It is pleasant to find that, whilst parties of English experts and students of town planning have found it instructive to visit Germany and to learn there useful lessons, the converse study of English methods is sufficiently important to attract visitors from Germany, and under the auspices of the German Garden City Association a party of some seventy ladies and gentlemen, including His Excellency Ulrich von Trotha (chamberlain to the Crown Prince of Germany), Herr Vrelhaber (one of the directors of Krupps) and Councillor Smith, of Essen, besides representatives of other German municipalities, are now visiting our country to study our methods.

When the Sheffield Town Hall was built from the designs of the late Mr. E. W. Mountford, it was considered by many of the townspeople to be extravagantly commodious, but even the growth of municipal activities has apparently rendered necessary a considerable extension, for which Mr. Edwards, the City Architect, has prepared the plans. The Council Chamber is to be enlarged by the construction of a new public gallery, the space occupied by the present one being thrown into the Council Chamber. The Lord Mayor is to be provided with a bedroom and dressing-room, and the Lady Mayoress is to have a boudoir. There will be a bath in the dressing-room. Another new room is to be the Council Retiring and Reception Room, which will be about double the size of the existing ante-room. The present Retiring Room is far from adequate. It is much too public. It serves as a waiting-room for callers and a tea-room for Councillors, so that no privacy can be obtained. The smoke-room is even more undignified. Members who wish to smoke have to sit in the cloak-room with hats and coats as their only screen. So that Councillors will appreciate a room to which they can retire and find some degree of privacy and comfort. Other new rooms on that floor will be devoted to the Water Works (drawing office), to the Water Works Engineer, to licensing business, and to Old-Age Pensions work. New rooms on the floor below will be mainly for the City Engineer's Departments for Town Planning, Improvement, Building Inspectors, &c.; while on the lower ground floor the Chief Assistant-Overseer's Department will find the additional accommodation required. The City Architect will take all the additional rooms (seven) on the second floor. The estimated cost of the proposed extension is £38,798, which includes a new system of ventilation for the Council Chamber.

The summer meeting of the Royal Archæological Institute opens next Tuesday at Cardiff with the customary civic welcome in the City Hall. In the afternoon visits will be paid to Cardiff Castle, St. John's Church, the site of the Austin Friary, and the Welsh Museum. The opening day will conclude with a short address at the City Hall by the Earl of Plymouth, the president of the meeting. When the Royal Archæological Institute met at Oxford last year there was no little difficulty in deciding which interesting features could be overlooked at their headquarters so as to allow sufficient time for excursions in the neighbourhood. About three and a half days out of eight were apportioned to the University city, and even then much was left untouched. But at Cardiff no such embarrassment of riches occurs. Consequently, the organisers have arranged for itineraries in South Wales for seven out of their eight days. On the other hand, as the area covered is wide, the expense is proportionately greater. On Wednesday, July 26, the train starts at 9.15 for Caerphilly Castle, and visits will later be paid to Llandaff Cathedral and St. Fagan's Castle. On the next day the visits include St. Donat's Church and

Castle, Llantwit Major Church, and Old Beaupré. On Friday, the 28th inst., the party will see Coity Castle and Church, Coychurch, and Ewenny Priory. Good-bye will be said to Cardiff on the Saturday, as the headquarters will be transferred for the remainder of the meeting to Tenby, visits being paid en route to Margam and Neath Abbeys. The principal antiquarian objects to be seen at Tenby are the almost complete fourteenth century town walls and the church. Wind and weather permitting, the party take a steamer on Monday afternoon, July 31, to the Isle of Caldy, where the existing monastic establishment can be traced back to the sixth century. Three castles will be visited on the next day, viz., Carew, Pembroke, and Manorbier, as well as Lamphey Palace and Monkton Priory Church. The concluding day, August 2, will be spent at St. Davids, which includes the Cathedral, the Bishop's Palace, and St. Mary's College. The programme is, it will be seen, a highly interesting one, and it only remains for favourable weather conditions to prevail to make the 1911 summer excursion of the Royal Archæological Institute as successful as any of its predecessors.

NINTH INTERNATIONAL CONGRESS OF ARCHITECTS, ROME, OCTOBER 2-10, 1911.

General Rules.

THE subjects for discussion in the Ninth International Congress of Architects have been decided upon by the Managing Committee in accordance with the Permanent Committee for Congresses of Architects.

1. Any language may be used at the opening meeting.

2. The languages to be used in the discussions must be French, Italian, English or German.

3. All duly enrolled members may present articles and resolutions for consideration upon the various subjects appointed in the programme. These must reach the General Committee of Organisation before August 15, accompanied by a summary in one of the four admitted languages.

4. If at the above-mentioned date no article or proposal has been presented on any given subject, that subject will be cancelled from the order of the day.

5. The General Committee of Organisation will compile summaries of the resolutions to be put to the vote in the four admitted languages and have them distributed before the opening of the Congress.

6. The Congress will hold a general inaugural meeting in which the order for each day will be decided on by the General Committee of Organisation in agreement with the Permanent Committee.

7. The names of those to constitute the Presidency of the Congress will be proposed by the Permanent Committee in agreement with the General Committee of Organisation in a special preparatory meeting; these names to be communicated to the inaugural meeting for confirmation.

8. In the successive meetings subjects will be discussed in the order appointed by the Presidency.

9. The sittings will be presided over by the President, or by a Vice-President delegated by him, also by three other Vice-Presidents of different nationalities and by the secretaries.

10. When any member of the Congress has expressed his opinions, all other members have the right to offer criticisms. All discussions are to be conducted according to Parliamentary rules.

11. Every introducer of a subject will be allowed ten minutes for speaking; other members will be allowed five minutes to speak once on any subject. The introducer is allowed five minutes at the end for reply. Proposers of special orders of the day are allowed five minutes to make explanations.

12. Governmental delegates have the right of expressing their opinions before the votation on any resolution.

13. At the close of every sitting the secretaries give reports of that sitting in the four languages of the Congress.

14. In case of a multiplicity of resolutions proposed on the same subject, the President is empowered to request the proposers to amalgamate them all in one. The Presidency of a Committee has like power in a similar case, and may, previous to the Congress, nominate a proposer, who will however retain the right of speaking on his subject during the sitting in which it is discussed.

15. When the discussion of a subject is closed, resolutions have been approved, and the order of the day is gone through, the Presidency has power to postpone the votation to another sitting, but the discussion must not be re-opened.

16. Except in special cases, voting follows immediately after a discussion, and the various resolutions are voted for in the order of their presentation; precedence, however, is given to any resolution declaring a subject not admissible.

17. Voting may be made by show of hands or by division, and the decision of the Presidency is final.

18. If a request, however, be made by ten members for a second counting of votes, it must be immediately granted.

19. All resolutions passed in the various sittings must be communicated to the closing meeting, and put to the vote, either by show of hands or by division.

20. Only those resolutions of the Congress are valid that have been confirmed by votation in the closing general meeting.

21. The Presidency will decide as to the other subjects which should be in the order of the day at the closing session.

22. All effective members have the right of voting and taking part in discussions subject to the rules. They may also introduce resolutions connected with the subjects in the order of the day.

23. Resolutions together with articles on subjects not included in the order of the day may be submitted in writing, in one of the four languages, to the first meeting of the Congress. Said resolutions must be supported by at least twenty effective members, and if the assembly by a majority of votes consents, they will be entered in the order of the day of a future sitting.

24. Besides the ordinary sitting there may be held special meetings for lectures and other communications. After a lecture there will be no discussion or voting. The programme for such meetings will be prepared by the General Committee of Organisation before the convening of the Congress, and will not admit of any alteration.

Regulations for Enrolment of Members of the Congress.

1. The ninth International Congress of Architects is to be held in Rome from October 2 to 10, on the occasion of the Jubilee festivities for the proclamation of the Kingdom of Italy, in conformity with the decisions of the permanent Committee of Management of the International Congresses of Architects in the session of May 23, 1908, at the close of the Congress of Vienna.

2. The Congress is organised by a specially constituted General Committee of Organisation consisting of the Italian Section of the permanent Committee, of the delegates of the academies and of the various associations, of the representatives of the artistic and architectural press, and of architects appointed at the sitting of July 2, 1909, in conformity with the statute of the permanent Committee of International Congresses of Architects.

3. The Congress will convene in Rome the members of the permanent Committee of International Congresses of Architects, the members of the various sections of that Committee, the special delegates of Governments, the representatives of all the academies and associations of architects and all who, being interested in the art of architecture, will enrol themselves according to the following rules.

4. The Congress will consist of effective members and associates.

Effective members are the special delegates of Governments, academies and associations, and all architects and students of subjects connected with architecture.

Academies and associations may be enrolled as effective members, and represented by a delegate.

Associates are the persons of the family of effective members.*

5. The entrance fee for effective members is 25 lire, and for associates 15 lire.

Government delegates pay no entrance fee.

6. Members and associates will be enrolled in the various countries by the sections of the Permanent Committee, in Italy by the General Committee of Organisation, and in countries where as yet there is no section of the Permanent Committee, by special delegates appointed by the Permanent Committee.

7. The section will make all needful regulations regarding enrolment in their respective countries, they will decide

---

* The Permanent Committee for Congresses of Architects has unanimously agreed upon the desirability of following in every country the general rule to admit as members of the Ninth Congress only architects and persons actually practising the art of architecture whether in a public or private capacity, and as associates only the wives, sons and daughters of members.

whether applicants are eligible, and in what category they should be placed; they will receive the names and entrance fees, and will send them to the General Committee of Organisation at least not later than September 1, 1911.

8. The said sections are empowered to deduct 5 per cent. from the amount of the entrance fees to reimburse themselves for expenses of postage, &c.

9. Members and associates have equal rights to reduction of railway fares, to reduction of hotel expenses, to special tickets of admission to galleries, museums, &c., and to be present at all the sessions of the Congress, and at all the festivities mentioned in the programme. But only effective members have the right of joining in discussions, of voting, and of receiving the printed publications of the Congress.

ABBOT'S LANGLEY AND KING'S LANGLEY.*

So much of antiquarian, archæological and historic interest has been written about the county of Hertford that it is extremely difficult in dealing with the literature concerning any one place to know what to select and what to ignore. In the course of my reading I find Langley mentioned no less than three times in Domesday Book. From the record there preserved it appears that at the time of the Norman Conquest one of Earl Harold's men named Swen held a manor of Langelei, which consisted of a hide and a half of land and was worth thirty shillings in the time of Edward the Confessor; that the Abbot of St. Albans held the manor of Abbot's Langley, consisting of five and a half hides and worth fifteen pounds; while the manor of King's Langley, consisting of a hide and a half and worth eight pounds, was held by two of Earl Lewin's men named Thuri and Seric. After the Conquest, Swen's manor was held by one Othbert, and the manors of Abbot's Langley and King's Langley were taken to form part of the huge fee assigned to Count Robert of Mortain, the Conqueror's half-brother.

"Names being necessary to distinguish one place from another, it is but natural that those names should be chiefly taken from some palpable peculiarity either of position, soil, natural products, or appearance of the locality. . . . Langley—signifying the Long Pasture—would naturally suggest itself as an appropriate name for an extent of fertile land unobstructed by timber, and watered by a stream flowing through, or by, it. Hence we find throughout England a great number of places known as Langley. The counties of Berks, Durham, Essex, Kent, Norfolk, Oxford, Salop, Warwick, and Wilts, have each a Langley; and in other counties are found compounds of the same name, as Kirk-Langley in Derbyshire, and Langley-Marish in Buckinghamshire" (Cussans). That part of Langley lying to the west of the River Gade was designated King's Langley from the fact that Henry III. erected a palace there, in contradistinction to the part, lying on the other side of the river, which was termed Abbot's Langley, from the fact that in the time of Edward the Confessor it was given to the Abbots of St. Albans by Egelwine the Swart (or Black) and Wincelfled his wife. The monks of St. Albans continued to hold the manor of Abbot's Langley until the Dissolution of the Monasteries, and it appears to have come into the possession of the Crown by purchase in the latter half of the sixteenth century, but to have remained Crown property for less than one hundred years, for one Francis Combe left it in 1644 by will equally to Sidney-Sussex College, Cambridge, and Trinity College, Oxford.

CHURCH OF ST. LAWRENCE, ABBOT'S LANGLEY.

Abbot's Langley is chiefly interesting as being the birthplace of Nicholas Breakspear, who became Pope Adrian IV. He was the only Englishman who ever occupied the papal throne. He was the son of a servant in the abbey of St. Albans, where he himself filled a menial post for some time.

CHURCH OF ST. LAWRENCE, ABBOT'S LANGLEY.

He is said to have shown very little talent in his young days, and was considered so dull of intellect that when he asked to be admitted to the monastery as a monk he was driven away for his presumption. However, he went abroad and studied, and was admitted as a lay brother to the monastery of St. Rufus, near Avignon in Provence, where he so distinguished himself by his diligence, learning, and strict observance of monastic discipline, that he was chosen Abbot on that office falling vacant. He became a Cardinal in 1146, and was elected Pope in 1154. King Henry II. sent the Abbot of St. Albans and three bishops to Rome with congratulations, which Adrian acknowledged by granting considerable privileges to the abbey of St. Albans, including exemption from all ecclesiastical jurisdiction except that of Rome. The following year Adrian, perhaps with natural pride in being able to confer favours on the King of his native land, and perhaps as an assertion of the papal claim to the right to dispose of kingdoms, and certainly in the belief that Henry would use his power for the good of religion, bestowed the sovereignty of Ireland upon him, but reserved all ecclesiastical rights, and made one penny from each house payable yearly to St. Peter. The bull making the grant to Henry contains the following passage:—

"There is no doubt, and your nobility acknowledges that Ireland and all islands upon which Christ the Sun of Righteousness has shone, and which have received the teachings of Christian faith, rightfully belong to the blessed Peter and the most Holy Roman Church."

Adrian IV. seems to have been a very masterful man; he even laid Rome itself under an interdict on one occasion. When Frederick Barbarossa entered Italy for the purpose of obtaining the Crown of Germany from the hands of the Pope, Adrian refused to confer it until Frederick had first held his stirrup as a mark of respect.

Quarrels afterwards arose between Adrian and Frederick of such a nature that Adrian determined to excommunicate Frederick, but before he could pronounce the sentence he died (1159). It is said by some that a fly choked him, but by others that he was poisoned, which is probably more in accordance with the practice of the times in which he lived.

The church of Abbot's Langley is a handsome and spacious building, partly Norman and partly Early English in style. The nave and tower are rough-cast, the chancel flint and stone. It is dedicated to St. Lawrence, a half-figure of whom may be seen in a small portion of glass in one of the clerestory windows in the north side of the church. The south porch is of eighteenth century work, but the inner door dates from the fifteenth century. The church consists of chancel, nave, north and south aisles, large south chapel, south porch, and west embattled tower. Although its architectural history cannot be traced back beyond the latter part of the twelfth century, it is believed that a Saxon church existed on the site, for at the time of the Domesday survey, a priest resided at Abbot's Langley. The nave of the church appears to be all that remains of the Norman building; the massive circular pillars, with their carved capitals and round arches bearing the zigzag or chevron ornament, are very fine and striking. The chancel is extremely long and narrow, and out of proportion to the other parts of the church. The south chapel, on the other hand, is spacious. This part was added early in the fourteenth century, and opened to the chancel by an arcade of two pointed arches. About the beginning of the sixteenth century an endeavour was made to improve the communication between the south chapel and the nave, and the south-eastern portion of the nave was taken down and a circular Norman column rebuilt as an octagonal column, an arch being thrown across in a somewhat oblique direction to the western pillar of the chancel presenting a rather awkward appearance. The South Chapel, frequently referred to as the "Lady Chapel," at one time superseded the chancel, the real chancel being used as a mortuary chapel. Paintings of two figures of bishops were originally on the eastern wall of the chapel, one of them probably representing St. Thomas of Canterbury (Thomas à Becket), but they can scarcely be seen now. The clerestory is irregularly spaced, having three windows on the south side and two only on the north side. These windows are of fifteenth century date, and so is the roof. The corbels supporting the tie-beams are ornamented with grotesque heads. The font is octagonal in shape, with a panelled bowl and stem, and dates from about the year 1400. "On the sides of the bowls are carved the emblems of the Evangelists within boldly cut quatrefoils alternating with shields similarly enclosed. On these four shields it is probable that the arms of the benefactors of the church were originally painted" (Cussans). A marble monument to Robert Raymond, Lord Chief Justice, is situated at the west end of the south aisle. The judge, a full-sized figure in a reclining posture, is in his judicial robes. He became Lord Chief Justice of England in 1724, and was made Baron Raymond of Abbot's Langley in 1731.

* A Paper read before the Upper Norwood Athenæum by Alfred Burch on July 1.

CHURCH OF ALL SAINTS, KING'S LANGLEY.

There are several brasses in the church: one with the effigy of Rauffe Horwood, died 1498, and his wives Elizabeth and Joan, with three sons and three daughters. The vestry screen of carved oak under the tower was erected in 1908, and the lych gate was put up in 1900 to the memory of her late Majesty Queen Victoria. Over the altar is a marble reredos portraying the Lord's Supper.

The manor of King's Langley, which at the Norman Conquest had been included in the fee of Count Robert of Mortain, reverted to the Crown when Robert's son William was dispossessed of his lands in consequence of the part he took in the rising of the Norman barons against Henry I. The manor was held successively by Eleanor, the Queen of Edward I., Edward Prince of Wales, Isabella, the Queen of Edward III., Joan of Navarre, the Queen of Henry IV., Cicely, Duchess of York, mother of Edward IV., Elizabeth, Queen of Henry VII., and by Catherine of Arragon, Anne Boleyn, and Jane Seymour, three of the wives of Henry VIII. It was subsequently annexed to the Duchy of Lancaster, and later held in trust for Charles, Prince of Wales (afterwards Charles I.). It was afterwards sold to pay the king's debts, and became private property.

A royal palace and park had their site on a hill a short distance out of King's Langley. The palace was in existence as early as 1299, and was built by Henry III., and occupied by himself and several of his successors. It was here that Edmund of Langley, the fifth son of Edward III. and Queen Philippa was born, on June 5, 1341, and baptized by Michael de Mentmore, Abbot of St. Albans. This Prince, afterwards created Duke of York, was the founder of the "White Rose" faction. He greatly distinguished himself with his brothers, the Black Prince and the Duke of Lancaster, in the French wars. Edward III. held his Court at the Palace of King's Langley, when London was devastated by plague in 1349, and Richard II. kept Christmas here in great state in 1392. The fourth scene in the third act of Shakespeare's play of *Richard II.* is laid in the garden of the palace, and it was there that Richard's Queen overheard one of the gardeners tell of her husband's overthrow by Henry of Bolingbroke, when she exclaimed:—

> "Gardener, for telling me this news of woe,
> Pray God the plants thou graft'st may never grow."

That prayer has been fully answered, for garden, palace and all are gone, and only a few stones serve to mark the site.

Dugdale says that "an house of Friars Preachers (Black, or Dominican Friars) was founded near the royal palace of King's Langley (under letters patent of Edward II. in 1308), by Roger, the son of Robert Helle, an English baron, and enlarged in buildings and increased in revenue by the munificence of the kings Edward I., Edward II., Edward III., and Edward IV., so as to exceed all houses of this Order in England, being valued, 26 Henry VIII., at 122*l.* 4*s.* per annum (Dugdale), 150*l.* 14*s.* 8*d.* (Speed). Queen Mary restored this House to a prioress and nuns who were dissolved 1 Elizabeth and the site was granted 16 Elizabeth to Edward Grimston." The English baron referred to as Robert Helle is said to have been "so-called, because he played the devil with the Welsh."

The church of King's Langley is dedicated to All Saints. It is built of flints, with quoins and dressings of Totternhoe stone, in the Perpendicular style, and consists of chancel, nave of three bays, north and south aisles, north and south porches, and a western embattled tower, with a short, thin spire, containing a clock and six bells. The walls of the nave date from the thirteenth century, and the plan of the nave is probably that of a still earlier building. The north aisle is believed to date from the early part of the fourteenth century, but the nave and south side of the church were practically rebuilt about a century later. The north chapel and western tower were probably rebuilt later in the fifteenth century. Three pointed arches divide the nave from the aisles, and a fine one divides the nave from the chancel. The roof is of timber, arched and modern throughout. The only woodwork of interest is the pulpit, which is a pretty specimen of early seventeenth century work. It is hexagonal in shape, with a carved and panelled body resting on a modern stone base. One side of the body is modern, but the brackets carrying the projecting book board are original. Over the pulpit is the original tester, adding greatly to its effect. In a small window on the north side of the north chapel is a little old glass. The stained glass window at the east end of this chapel was the gift of her late Majesty Queen Victoria. The north chapel contains the tomb of Edmund of Langley.

INTERIOR.—CHURCH OF ALL SAINTS, KING'S LANGLEY.

The tomb was originally in the Friary Church, whence it was removed to All Saints Church in 1575, and placed inside the altar rails against the north wall of the chancel. It was moved to its present position in 1877. The tomb, the sides of which are of alabaster on a plinth of Purbeck marble, is especially interesting on account of its carved heraldic decoration of Plantagenet shields. There are three shields at each end, and seven on its western side, but those on its eastern side are now lost. The three at the north end are (1) St. Edward the Confessor, (2) King Richard II., (3) St. Edmund, king and martyr. The seven on the west side are (1) Shield of the Empire, (2) Prince of Wales, (3) Lionel Duke of Clarence, (4) Edmund of Langley with Isabel, daughter of Pedro the Cruel, (5) Edmund of Langley, Duke of York, (6) Thomas, Duke of Gloucester, (7) Henry of Bolingbroke, Earl of Derby. The three on the south end are (1) Holand, Earl of Kent, (2) Holand, Earl of Huntingdon, (3) FitzAlan, Earl of Arundel. The present top of the tomb is part of an altar slab, and bears three out of the original five incised consecration crosses in allusion to the five wounds of our Saviour. The original cover to the tomb stands against the wall of the chapel. It bears the indent of a female figure which can only be that of Edmund's wife Isabel, who died in 1393. When the tomb was moved the bodies of one male and two females were found inside, one being without doubt the body of Edmund himself, while the others are supposed to be those of his first wife, Isabel of Castile, and of Anne Mortimer, the great-granddaughter of Edward III., and wife of Richard of Conisburgh, second son of Edmund of Langley.

The north chapel is separated from the north aisle by a screen, next to which is a plain tomb of white marble to Sir William Glasscocks, Knt., Judge of the Admiralty in Ireland in the reign of Charles II., who died in 1688. Near by is an old iron coffer strongly bound, and a large altar tomb of Caen stone, bearing upon it the recumbent figures of a knight and lady. The figures are much injured. The knight is in chain armour with hands folded. The lady has a robe, and over it a long cloak, and from her neck hangs a chain and cross. Her hands are broken off, and her face is much mutilated. Salmon states that, in his opinion, this is the tomb of Piers Gaveston, the favourite of Edward II., whom Stowe says was buried in this church, but the arms upon the tomb are those of Sir John Verney of Pendley, who was Sheriff of Hertfordshire and Essex in the fourteenth year of the reign of Henry VII.

Several slabs with brasses still remain in the church. One to the memory of John Carter, who was buried in 1588, represents him as having had two wives and nine children by each, eighteen in all. In the vestry is a curious proclamation of the time of Charles II. concerning the selection of children for "The Healing." It is supposed to refer to the healing virtues of the touch of the "Merry Monarch," which was in those days regarded as efficacious in certain disorders. Behind the altar is a handsome reredos of marble and stone representing the Lord's Supper, and carved in high relief. It was erected in 1877 by the late Mr. A. H. Longman, J.P., to the memory of his father.

In conclusion I must express my indebtedness for the information contained in my paper to the works of Cussans, Andrews, Bayley and Britton, Tompkins, Dugdale, Murphy, and Kelly, to the Encyclopædia Britannica, the Victoria History of Hertfordshire, and the recent report of the Royal Commission on Historical Monuments in Hertfordshire.

MODERN ELECTRIC WIRING PRACTICE.

AT the annual convention of the Incorporated Municipal Electrical Association, which was held at Brighton last week, the subject of modern wiring practice was discussed. Mr. J. W. Beauchamp, Chief Electrical Engineer, Tunbridge Wells, said that the barrier which must be overcome before the use of electricity can become general was the difficulty of introducing electricity into premises where, on account of cost, there is a disinclination to install the necessary wiring and fittings, although the supply may be desired and its economy well understood. Doubts have been expressed as to the probability of small consumers being remunerative. Certainly such business was of a special character, but on account of its possible magnitude and the comparatively high load factor of lighting supply to private houses it deserved special treatment, more particularly as the growing demand for electric street lighting made it necessary to lay cables in roads where only the smaller consumer could be obtained. A suitably designed system of wiring would do much to assist in solving this problem, and in this connection he discussed the features of modern wiring practice and regulations in so far as they influenced the cost of small-installation work.

Although the Institution of Electrical Engineers' rules were adopted by most supply authorities, there still remained so many exceptions and amendments that no real standard could be said to exist, and there was great lack of uniformity in the quality of electrical installation work within any particular supply area, regulations being observed in the better-class work and evaded or only complied with in a perfunctory manner where competition brought down the price of wiring. Against this tendency the supply authority could only struggle with difficulty as the general run of small house and shop wiring usually fell to the lowest tender, and in many cases there was not the most elementary form of specification to ensure that the several offers were based on the same requirements. This had a demoralising influence on those who tendered for the work, apart from questions of material and workmanship. In many instances they did not allow for a proper arrangement of fittings to secure economy in use for fear that a more meagre scheme at a lower price should be accepted, the builder or the occupier being seldom able without advice to appreciate the greater value which may be offered for the higher price.

The requirements of regulations should be as light as possible, but the enforcement of them should become more stringent. A change in this direction should secure greater uniformity of work, tending to lower the cost of high-class wiring and force up the quality of the lower-class work, as in the latter almost all the trouble arose from insufficiently skilled labour, it being obvious to anyone whose duty it was to inspect wiring work that the employment of competent and full-priced wiremen would frequently reduce the prime cost of jobs and save good material from being reduced to a second-hand condition before it was even put to work. Many of the existing rules were directed towards securing for the consumer a well-designed installation, with regard to capacity of conductors, sectionising, &c. As these could not be enforced, and their value depended so much upon individual circumstances, they would be better eliminated from the category of "don'ts," and issued by the supply authority in the form of simple model specifications describing the requirements of good practice suitable for several different classes of wiring work. Such official specifications would, in his opinion, do much to render practice and prices more uniform, and allow contractors to cultivate different classes of wiring work in accordance with their inclinations and capacity. In any case, in view of the rapidity with which electrical practice changed and the fact that so much electric lighting work was secured in competition with other systems of light and energy supply, it was undesirable that wiring regulations, however simple, should be administered in an inflexible manner, or pass under the control of any centralised body not directly interested in the commercial development of the supply undertakings involved. A consideration of the published regulations of a number of British and foreign authorities controlling or advising upon electrical work showed how great a divergence existed in their requirements, and suggested that, even after allowing for climatic differences and local conditions, the cost of wiring must be affected considerably by the varying limits imposed. The usual insulation-resistance test depended more upon dryness of the building and care used in connecting up fittings than upon the actual resistance of the dielectric, and a fair result might be obtained from wiring which had suffered considerably by careless workmanship and might be doomed to early failure. For these reasons a much lower insulation resistance than was usually called for would suffice, but should be supplemented by inspection of samples of hidden work in every case. It would appear that the true limit of lighting capacity which might be connected to one side of a three-wire system was in the ability to make proper current-carrying connections in the various "loop in" fittings used on branch lighting circuits; 10 amperes should be a workable maximum.

In many cases the limits of pressure-drop at full load were not stated as a percentage, even where supply was given at two different pressures. This provision was suitable for a specification to secure the use of cable of ample size, although where possible actual-sized to be used should be stated. Provided that wiring was not dangerously overloaded, the question of pressure-drop concerned the consumer chiefly, and the increasing efficiency of lamps did not warrant the use of heavy wiring. There was a most striking difference between British and German wiring regulations in the permissible loading of cables. A distinct definition of current-carrying capacity for switches and fuse-fittings was needed

—most modern patterns fulfilled every requirement with regard to breaking circuit, but were greatly overrated so far as concerns their power of carrying full-load current continuously, the makers apparently relying upon the fact that loading was unusually intermittent, or not making enough allowance for inaccurate machining and fitting of parts, which discounted the provisions of the designer very much.

Earthing regulations mostly failed to define the essential requirements for security for risk of shock or fire, which were that every part of a metallic sheathing or conduit system containing conductors should be permanently connected to earth by a conducting path of sufficiently low resistance to carry, without sparking or heating at any part of system, the maximum current which the main fuses of the installation will pass. The earth wire, also, while requiring a definition of minimum size for reasons of mechanical strength, should have a stated size depending on the capacity of the installation. The minimum might be No. 18 S.W.G., No. 14 being unduly heavy and expensive for use on small installations, and, beyond this, the sizes used should bear a relation to the main fuses, or circuit-breaker setting, of the system protected, being selected to carry the full current required to open the circuit without appreciable rise in temperature. Where local circumstances required the earthing wire to be of considerable strength, its area should be proportionately increased. Tests made with lamp or bell for the continuity of a tube system gave little indication of the current-carrying capacity of the many joints and connections through which a fault current would have to be discharged, while the accidental earthing of the tube at one or more points, by contact with structural metal work or water pipes, might make such a test quite deceptive. Earth connections should be made to the rising service pipes of town water systems, water meters being bonded across, or to metal plates buried in the earth in some position where natural dampness exists. Where the system of wiring made it impossible to render all metal-work of motors, lamps, and other apparatus metallically continuous, it was advisable to run throughout the installation a substantial and visible earthing wire or tape, to which all apparatus could be connected and to earth-connect it at one point. This connection could be tested at intervals from different points of the installation by taking an ammeter reading between it and the live poles of the wiring through a small known resistance. The readings would show up any change in the state of the earth connection and prove its energy-discharging capacity in a way which tests with a bell or lamp did not do. Where these methods of earthing were not possible, it was necessary to resort to devices of the lightning-arrestor type, of which the Cardew & Partridge appliances were probably the most used. In these a small air gap was maintained between the outer, neutral, or earthed pole of the system and a connection which included all tubing, frames, and metal work. In the event of the latter rising in potential beyond a certain limit the air gap is bridged by a spark or by electrostatic attraction of a light metal armature, and a short-circuit results, opening the fuses or circuit-breakers. These devices had the drawback that they did not operate with certainty excepting for pressure rises of considerable amount, and so did not altogether avoid risk of shock.

It was desirable to avoid connection to girders and constructional ironwork, which was often insulated by concrete, and even if it appeared to be well earthed, may be so through gas or other pipes making variable contact and subject to removal; to gas pipes of any kind; to hot-water and hydraulic-supply pipes, as they were often jointed with imperfectly conducting material or were only connected to a water-supply system through a tank and ball-cock; to water pipes drawing supply from cisterns fed by ball-cocks, or from wells, as the connection may be broken by lowering of the water level below the delivery or suction pipes; to other earth connections provided for telephones or bells, as these may increase in resistance or provide an alternative path through the instruments to other earths. Earthing in positions which might receive sewage or corrosive waste liquids was not to be recommended, and drains and gulleys, although full of water, often afforded a very indifferent connection to earth owing to the insulating character of the concrete or earthenware of which they are built. The increasing stringency of Home Office regulations had led to the production of various fittings designed to fulfil them. These new designs appeared to fall into two classes; one in which provision is made for earth connecting all metal-work, and the other in which insulating material shrouds all parts from which a shock might be obtained as a result of failure of internal insulations. When substantially made the latter class probably had the advantage, as its efficiency did not depend upon the condition of a more or less elaborate system of earthing wires and damage to the insulating shields could be at once seen and remedied. These precautionary measures were looked upon by many contractors as vexatious, the cost and trouble involved in meeting them was resented, and it became a matter of some difficulty to ascertain with certainty that a tube system, much of which was normally out of sight, had been made capable of safely clearing a fault which might arise in any part of it. In short, if the letter of the Regulations was observed, the cost of the cheaper classes of tube work was increased; on the other hand, if, as was usual, installations were accepted for supply on the strength of a few visible connections between the tubing and a convenient water-pipe, the combined shock and fire risk, small as it obviously was, was distinctly greater than it would be if no earth connection were provided. In an ordinary house, wired with slip-joint tube, a leakage current occurring at any point at all remote from the service entry would probably have to run the gauntlet of sundry loose connections under floors and behind lath partitions, on its way to earth. Undoubtedly, these considerations presented one of the gravest objections to the simpler systems of metallic conduit. Some device was needed to protect concealed wiring mechanically without involving the danger of spreading a leak, or the difficulty of furnishing a completely earthed sheath. Steel tube had much to recommend it on the score of protection for wires and low cost of erection, and had done much to encourage the wiring of small houses during construction, for which purpose it was very suitable. It would seem worth while to consider the extension of the principle of **earthing only portions of tube** within actual reach in wet places, and keeping the remainder in isolated single lengths by the use of fittings and sockets which actually insulated instead of partially connecting as at present; this could be effected by lined sockets or by serving the outside of the tube with compounded tape or braiding—a similar process was used for the protection of iron, gas, and water mains on the Continent, and would not increase the cost of the conduit appreciably, whilst protecting it from rust and destruction by ash, concrete, and plaster. The principal weakness of the earthing precaution lay in the fact that it was not essential to the working of the installation, and the wires and joints upon which it depended might suffer damage without the fact being revealed until they failed to give the expected protection.

Condensation trouble in conduit was only serious where runs of conduit were subject to different temperatures, as in passing from living rooms to cellars and outdoor positions, and could, to a great extent, be prevented by providing drain holes at lowest points and by the use of inspection-boxes well filled with slag wool, or similar non-conducting substances, at points between which considerable temperature difference may exist. Corrosion in buried conduit was generally the result of condensation which, particularly with "close" joint tubes, permitted surrounding plaster to become moist and chemically active; this was very noticeable with plaster or concrete made from ashes. The use of "close" joint tube in any form of cement or plaster was undesirable, but difficult to prevent on jobs where brazed or seamless material was not insisted on throughout. There appeared to be a useful field for a conduit lapped with coarse tape or jute, and compounded outside for such positions.

The most important recent development in wiring appeared to be the re-introduction of the concentric principle in the form of the "Stannos" Wiring System, and where it is possible to work on the surface of a building and use concentric conductors with the outer or return sheath earthed, a saving in cost of 10 to 15 per cent. over slip-joint conduit wiring could be secured by means of it in the hands of men accustomed to its use. Its chief disadvantages appeared to be:—The multiplication of mechanical joints or points where loose connections may occur; the difficulty of securing to plaster and composition walls and ceilings; comparatively feeble resistance to accidental damage; risk of loss of continuity, and consequent sparking or pressure rise on the outer conductor in the event of loose contacts or breakage of sheathing. These difficulties were rather matters of detail, and many of them could possibly be overcome. The great value of this material was in the fact that faults quickly developed into short circuits and put the bad section out of use, whilst repairs were easily carried out; in addition, all the simplicity and advantages of a single pole system were secured. Flexible wiring had been much discussed from time to time, but no effort made to define its utility, or to establish any regulations which might make it safe for certain classes of work without rendering it too expensive. In consequence, a considerable amount of such wiring was actually in use in this country, the material being used in a most improper manner, and only saved from failure by its high quality. Some attempts had been made to produce a strong and safe flexible wire, the result being usually rather clumsy and as costly as the cheaper forms of permanent wiring. There would appear, however, to be a field for such material in connection with heating circuits; a heavy armoured and fairly flexible cord to carry up to 10 amperes without overheating, and provided with good plug terminal fittings and fuses of the cartridge type, might reduce the first cost and consequent difficulty of inducing users of electric light to put in heating and cooking apparatus; such wiring could also be a tenant's fixture capable of removal to, and use in, other premises. A disadvantage peculiar to all fixed surface wiring systems was the difficulty met with when redecorating walls and ceilings, particularly when papering. This fault was sometimes lost sight of by those who advocated such systems, on the grounds that existing decorations were not injured.

Dealing with the cost of wiring small premises, Mr. Beauchamp said that the influence of the system adopted upon cost was indicated by the following figures, which, although actually variable according to circumstances, were relatively representative of the principal methods available for wiring small houses. Examination of these figures also brought out the fact that on the cheaper systems labour costs became a much smaller proportion of the total, suggesting that it was only under some organised scheme of wiring houses in quantity, such as might be arranged by a supply authority, that the fullest economy of these methods could be realised. In putting in very small isolated installations by means of workmen not continuously employed on this class of wiring, it was not to be expected that the labour costs could be kept down to the figure necessary to justify the methods.

Relative Cost per Light of Wiring in Small Private Houses Complete with Metallic Lamps and Simple Pendants.

(To be continued.)

In connection with the awards made at the Royal College of Art, South Kensington, it is announced that Mr. G. H. Foggitt, a former student of the Department of Architecture at the Leeds School of Art and a competitor in *The Architect* Sketching and Measuring Club, has been awarded a travelling scholarship value £50 for his work in the architecture school of the College. Mr. Foggitt has also been granted the diploma of the College in architecture.

HEATING AND VENTILATING ENGINEERING.

At University College, London, in the Faculty of Engineering, it is intended next session to inaugurate a course of instruction on Heating and Ventilation under the direction of Mr. Arthur H. Barker, B.A., B.Sc., Wh.Sc.

This course is intended for students having a sound elementary knowledge of mathematical science, and intending to specialise in the practice of heating and ventilation.

The full course comprises:—

Z 1. Preliminary public course of lectures on "The Real Nature of the Problems in Heating and Ventilation awaiting solution by the Engineer."

First Term: Tuesday, 5 p.m.

Z 2. Course of lectures on the detail of the subject. This course comprises discussion of the application to the problems of heating and ventilation of the principles of science, and includes such subjects as the following:—Properties of air, water, and steam; theory of heat, conduction, radiation, convection; theory of flow of fluids, air, water, steam; transmission of heat through walls, windows, doors, roofs, &c.; emission of heat by radiators and pipes under different conditions; combustion of fuels, quantities of air, and temperatures attained under different conditions; boilers and chimneys—the principles of design, construction, and economy; distribution of heat, principles of water circulation, high pressure hot water, principles of steam circulation; application of the theory of the flow of water and steam in pipes to the determination of pipe sizes, (*a*) natural circulation, (*b*) forced circulation; descriptions of the various systems of forced circulation and the calculations for them; heating by warm air, stoves, fireplaces, gas, and electricity.

Second Term: Tuesday, 5 p.m. *Fee:* £1 11*s.* 6*d.*

Z 3. A course of laboratory instruction, illustrative of the above subjects (Z 2).

Second Term: (day and hour to be arranged). *Fee:* Lectures (Z 2) and laboratory instruction (Z 3), £3 3*s.*

A 1. Experimental research for those students competent to undertake original work under the direction of the lecturer. This work will continue throughout the session.

Students admitted to this course will pay a registration fee of one guinea and a term fee not exceeding three guineas a term. (The latter will vary according to the amount of time and work.)

A 2. Drawing office.

The work in the drawing office will include the preparation of complete schemes for the heating and ventilation of large buildings. Students will be required to make complete calculations and take out quantities, price them, and generally to do the whole of the work necessary for the preparation of a high class tender for the work. All students studying the subject should devote at least two days a week to drawing office work throughout the second and third terms.

Students taking the full course in heating and ventilating engineering will be required to translate selected papers from French and German into English. Students who have not already a good knowledge of French and German should attend courses in the departments of French and German, so as to be able to read those languages with ease.

At the end of the second term, a tour in Germany will be arranged to inspect important installations there. The tour will be under the guidance of the lecturer, to whom application for further particulars should be made.

ILLUSTRATIONS.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR.

The foundation-stone of the University College of North Wales was laid on July 9, 1907, by his late Majesty King Edward VII. On July 14 last the buildings were formally opened by King George V. The site, which was purchased by the Corporation of Bangor, and then handed over as a free gift to the College, stands on a considerable slope. In plan the buildings may be said to take the form of two quadrangles. The exteriors are faced with Cefn stone from North Wales, while Precelly slates are used on the roofs. A limited competition was arranged in 1906, and the design submitted by Mr. Henry T. Hare, F.R.I.B.A., was selected out of those submitted by five architects. Up to the present over £100,000 has been subscribed to the fund, but further contributions are required before the entire building scheme can be carried out and the buildings opened free of debt.

A MODERN SYSTEM OF PROTECTING BUILDINGS FROM LIGHTNING.

By Mr. KILLINGWORTH HEDGES, M.I.C.E., Hon. Secretary of the Lightning Research Committee (1905 Report).

THE ever-advancing science of the twentieth century has recognised the all-important part which electricity plays in the routine of everyday life, and has learnt to enslave it for the public good and also to safeguard the community against the many dangers where it is insufficiently controlled. The greatest installations of earth-made electricity are puny indeed when compared with that which comes from the heavens above, and it is only by conjecture that we can fix the length of the lightning flash or determine its potential, as the energy developed by a single B flash * is probably greater in horse-power than the total amount of current produced by all the generating stations which supply the lighting and traction of the whole of London.

What the actual electromotive force in volts behind a flash is which enables it to leap through space hardly matters, as we have so many examples of the destructive force exerted on buildings; it must be something more than electrical E.M.F. which causes the lightning to drill holes in the solid granite of the Alps and fuse the sands of the desert into quartzose, forming the beautiful tubular rootlike structures called "fulgurites."

Grand however as it undoubtedly is to watch the lightning and listen to the reverberations of the thunder, we each and all of us, say what we will, instinctively dread it, knowing it to be so frequently destructive to life and property; and this being so it becomes a matter of great interest to the architect and surveyor to examine the methods hitherto used for the protection of buildings, and to consider how far they have succeeded and how modern lightning conductors should be installed.

To most of us this lightning conductor is a familiar object which inspires us with a sense of safety if (during a thunderstorm) we enter a building to which it is attached. We have no doubt been brought up with the idea that if a flash of lightning were to visit our immediate neighbourhood it would infallibly make straight for the conductor and through it pass harmlessly to the ground. Probably this view is still held by many architects and others who, having designed an imposing building, add a few words to their specification, such as "A suitable lightning conductor to be fixed." The effect of a single conductor on a large building is about as much good as placing a signpost on the roof with an inscription that "Lightning is warned off." An unprotected house is struck and perhaps set on fire by lightning, and the owner of a similar building imagines that because a metal rod has been erected some time or other and runs from the top of one of the chimney stacks to earth, his building is immune. Why should a flash which has perhaps travelled through a mile of space be led out of its course for the last few yards of its journey to strike this conductor while there is other metal work about the roof which offers a path, though not so direct, to earth?

The Lightning Research Committee, organised jointly by the Royal Institute of British Architects and the Surveyors' Institution, investigated a very large number of strokes from particulars furnished by their observers, each case being tabulated on a special form. After the first year it was decided to confine the investigations to buildings fitted with conductors, and forms were received with particulars of thirty-nine buildings which were supposed to be protected.

They will be found summarised and put into tabular form in Appendix A of the L.R.C. 1905 Report.

The principal causes of the failure of the usual style of lightning rod as fitted on the buildings investigated appear to be due to the following: (1) insufficient number of conductors and earth connections; (2) the absence of any system of connecting the metallic portions of the building to the lightning conductor, especially the interconnection of the roofs, finials, rain-water pipes and gutters. These lightning strokes may be divided into three classes: (1) those where the conductor effectively conveyed a portion of the stroke to earth, but some of the current side-flashed to metalwork which was not connected to the earth and so damaged the building; the practice of running the conductor, in order to make a neat job, round projecting brick or stonework, often with sharp bends, doubtless facilitated in more than one case the deviation of the flash from its direct path; (2) in several observations a metallic roof of large area received the flash, it consequently became highly charged, and the single conductor failed to convey the whole of the stroke, and what might be termed a condenser effect was produced, and the very high tension current set up went to earth through the unusual path of a speaking-tube and electric bell wire; (3) a flash divided in the air and struck the roof of the house at two points, the rod successfully discharged one portion, but the other, falling several yards away where there was no conductor, jumped from brickwork to metal, considerable damage resulting.

Earth Connections.—The largest proportion of failures was due to defective earth connections; a coil of cable in some instances was the substitute for the earth-plate, and even where a plate had been used, owing to the soil drying near the foundations of the building, or subsiding on account of drainage, the earth connections of a fourth of the cases reported were faulty, the result being that instead of a path of low resistance and general distribution of energy an opposite effect was produced.

Although full details of the observers' notes are not published in the L.R.C.'s Report, there is much valuable information, and the writer has endeavoured to make it more interesting by reproducing some of the observers' photographs and sketches.*

Before setting out the various details of a building which should be considered by those who wish to shield it from lightning, one must first study the agent which we have to deal with; therefore the writer makes no excuse for quoting from Sir OLIVER LODGE's (member of the L.R.C.) preface to the Report.

"It is not so much quantity of electricity that has to be attended to as electrical energy." "A sudden dissipation of energy is always violent." "Guncotton possesses a store of potential energy locked up in it to a dangerous extent; if it be dissipated suddenly, as by percussion, a violent explosion results, but if it be dissipated gradually, as by a flame, the energy is got rid of without much damage." "So it is exactly with the store of energy beneath an electrified cloud or between one cloud and another." "Hence no one path can be said to protect others, and the only way to protect a building with absolute completeness is to enclose it wholly in metal; an invisible cage or framework of iron wires, however, descending vertically down its salient features, with the utilisation of any metal in its construction suffices for all practical purposes unless the building is a powder magazine."

Architectural considerations prevent the adoption of such a method in its entirety for ordinary buildings. There is no doubt however that practically perfect protection may be assured by a judicious modification of the existing practice of erecting single lightning rods, especially in the case of extensive and lofty buildings that project well above the surrounding structures or that stand isolated in the open country.

The single rods are doubtless the relic of the fallacy which was first dispelled by LODGE at the Bath meeting of the British Association in 1888, that there was a certain space beneath a lightning conductor which was shielded by it from harm. On the Continent we still find numerous iron rods carried five or even six metres above the roof, but their actual value is really on account of their number and that they are all joined together by a horizontal conductor, and their excessive height is probably useless.

---

* See L.R.C. Report as to characteristics of lightning.

* *Modern Lightning Conductors*, 2nd edition, 1910. (London: Crosby Lockwood & Son.)

A much better shielding effect would be obtained by running a horizontal cable fitted with vertical barbs all round and across the ridge of the roof.

The author has carried out this principle in a modified form in many buildings, using a triangular malleable iron casting which is furnished with a spike and is attached to the cable by means of a special lead joint, the lead being squeezed into a recess. This horizontal cable runs along the ridges of the roofs and is connected at intervals to the rain-water gutters, which with the rain-water pipes make the framework of a sort of cage, and in very large buildings several independent down conductors are run from the ridge to the earth. To complete the modified cage formation, a horizontal cable is carried right round the building and interconnected with the down conductors and all the rain-water and other pipes, and so to earth. There is nothing unsightly in this method and it enables much smaller conductors to be used than would be possible if there were not so many separate paths for the flash to follow. Either iron or copper rod or cable can be employed. The usual size is seven strands of ⅛ in. diameter or about ⅜ in. exterior diameter. At New Scotland Yard copper was first employed, but for the extension iron cable was erected about five years ago, and the zinc protection shows wear in only a very few places, which have been painted and copper substituted where the cable has been attacked by the sulphur fumes of the chimneys.

(To be concluded.)

EXCAVATIONS AT CORBRIDGE.

By Mr. W. H. Knowles, F.S.A., Hon. Secretary of the Corbridge Excavation Fund.

The site of Roman Corbridge is now being systematically excavated under the supervision of an Executive Committee formed for the purpose in 1900, of which his Grace the Duke of Northumberland, K.G., F.S.A., is president.

Though not on the line of the murus, Corstopitum owes its importance to, and no doubt acted as a supply base for, the soldiers who garrisoned the wall. It lies immediately to the west of the village of Corbridge, on the north bank of the Tyne, at a point where a Roman bridge—half a mile west of that now in use—carried Dere or Watling Street across the river.

By the aid of the foundations which have been uncovered, an idea of the plan of the place, the direction of the streets, and the character of the buildings has been disclosed. These incline to the arrangement common to a civil community more so than to that of an ordinary military post. They reveal, indeed, a city with a considerable cosmopolitan population, living a life of wealth and luxury, although evidence of the vicissitudes undergone by its people is visible in marks of destruction and reparation upon many of its buildings.

On the rising ground to the north-east of the bridge is a large and important private residence which has been many times altered and extended. In its latest stage it comprised a series of eight apartments arranged between two corridors, and returned at both ends towards the south. The floors of various dates are of opus signinum, with the usual quarter-round fillet at the junction with the wall. The south corridor was warmed by a pillared hypocaust below the floor, formed of stone pilæ. It was divided midway in its length by a door the threshold of which was grooved for jamb stones and holed for the door pivots. On the north an enclosed courtyard was approached from the street proceeding northwards from the bridge. The courtyard was paved with cobbles, and contained an onamental cistern 12 ft. by 8 ft., finished on the sides with a moulded stone coping and further enclosed by an opus signinum border. In it was found a sculptured lion and stag, which is worked upon part of the moulded coping.

On the plateau to the north, and it may be somewhat in the centre of the city, massive and important buildings were encountered. These bordered on a street about 36 ft. in width, of three different levels, with corresponding drains and gutter stones.

On the north side of the street is a fountain with a platform raised 2 ft. above the street level. It has a frontage of 19 ft., and is six-sided—two, the east and west, being about 8 ft., and the north and canted sides about 7 ft. 6 in. in length. On either side it is flanked by large square pedestals, and in front of it is a trough or cistern. The platform was enclosed by a low screen having a moulded base course grooved on the top to receive sculptured panels separated by projecting pilasters. Possibly, from a mask or other feature in the panels, the water spurted into the trough below, from which the populace drew their supplies of water; whether statues adorned the pedestals, or whether the structure served the purpose of a shrine or rostrum, must remain a matter of conjecture.

Two granaries have been discovered and remain open to view; they are of substantial and damp-proof construction and are larger but similar to those found in Roman camps, where, however, they usually occur singly, and not in the double form adopted at Corstopitum, South Shields, and Borcovicium. That these buildings were used as store places for grain is demonstrated by the discovery of wheat in this type of building at Ribchester and elsewhere.

The west granary was first erected. It measures on the interior 92 ft. 6 in. by 23 ft. 6 in., and is enclosed by massive walls strengthened on three sides by stout buttresses, the south end towards the road being occupied by the entrance door and loading platform. The walling is of rubble concrete faced on both sides with good ashlar masonry in courses. The floor, with the object of keeping the goods stored thereon free from damp, was constructed about 2 ft. 4 in. above the ground level and was formed with flags 4 in. in thickness, carried on parallel dwarf walls placed longitudinally, the channels formed between them being supplied with an effective current of fresh air by cross channels placed opposite to the ventilating openings in the outer walls.

The east granary is a little shorter but wider, and divided down the middle by a series of pillars, the base stones of which remain. Each granary had a portico of four columns projecting from the south front.

A building of exceptional dimensions and of excellent masonry was the forum. The structure seems to have been that of a forum or large store, and comprises a number of chambers arranged about a quadrangle measuring on the exterior about 220 ft. The walls are formed of unusually large stones, with rock facing on both sides of all the walling. The south and west ranges are divided into apartments about 20 ft. by 17 ft., those on the west side opening into the quadrangle, and those in the south on to the street. In the middle of the south range is the entrance to the interior of the quadrangle. The east range seems to have been undivided and was accessible from the quadrangle. The north range, if ever completed, has been altogether robbed of its masonry and its details difficult to determine.

The animal remains included specimens of red deer, sheep, pig, dog, duck, goose, grouse, and partridge; also the Bos taurus, var. Longifrons, is well represented, and the remains show that it was liable to a great degree of variation. In certain cases the animals could not have been much less in size than the present-day shorthorn, though the majority were about the size of the Chillinghams of the present time.

Several buildings of an industrial character have been discovered, also an exceptional quantity of pottery, articles in bronze and other metals, and numerous coins, including a remarkable find of forty-eight gold pieces between the inclusive date 370-85.

THE NEW ROOF OF GLASGOW CATHEDRAL.

The re-roofing of the choir of the cathedral, which was so much needed, has now been all but completed. The large scaffold which supported the electric crane and enabled the workmen to ascend and descend has been removed, and all that now remains to be done is to place in position the ornamental work at present in the hands of the carvers. When this has been done the new roof will be a very great improvement on the old. Externally, there is practically no difference in its appearance except that the covering is of copper instead of lead. Already its colour has begun to tone down under the atmosphere of the city, and the saving in weight by substituting the copper for lead is considerable. This is a relief to the old walls; but, although it amounts to many tons, it is slight compared with the severe strain which has been removed by the introduction of the new, absolutely rigid roof, in which all the old oak good enough has been re-used, and the whole strengthened by a well-designed steel truss supplemented by steel purlins and iron longitudinal ties at the wall heads.

The oak lining of the inside of the roof is very similar in form to that of the plaster vault of 1824, removed last year, but, in addition to its moulded ribs, it will be decorated by a series of carved bosses at the intersections of the various ribs, while the main ribs will carry angel figures with scrolls just above the wall heads. The centre row of nine carved bosses will illustrate the life of Christ, while the north and south parallel rows will be decorated by shields, with symbols bearing on the same great theme. The intersections of each of the diagonal ribs will also be enriched by a carved boss of foliage, so that the whole will form one of the richest roofs of timber of this period.

The old oak which has been re-used is very hard, and of a beautiful rich brown colour. It is interesting to speculate how old some of these trees must have been when they were felled in the thirteenth century; their sapling days must stretch away back to the time of St. Mungo's ministry here, to the dawn of history in Scotland.

The roofs of the north and south transepts are now receiving attention, and the scaffolding which was removed from the choir is being erected along the north wall of the nave, so that the same process of restoration may be applied there also. The ancient form of the roof is not known, but it may have been somewhat similar to that now over the choir. Here there will be a field for the delineation of Old Testament history as a parallel to that of the New which will shortly adorn the choir.

This work is perhaps taking longer than some people imagined it should, but it is necessary in operations of this kind to hasten slowly; and the public, who may have been a little impatient to see the work completed, may rest assured that it is being done in a thoroughly efficient manner by His Majesty's Office of Works, so that the roofs may be worthy of the walls which they surmount, and as permanent.

CALCULATIONS FOR RETAINING WALLS.

THE calculations necessary in designing retaining walls of any description are generally thought to be rather involved. It is proposed to show how anyone with an elementary knowledge of arithmetic may calculate the size of a wall for any position required.

It will be convenient to consider first ordinary fence-walls—that is, walls which may fail owing to the pressure of the wind. Fig. 1 represents such a wall 10 feet in height.

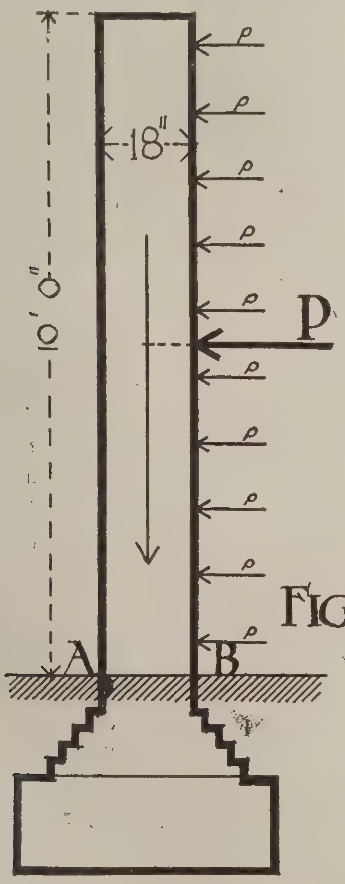

FIG 1.

The wall is subject to wind-pressure on either side, but it will be sufficient to consider the wind as acting on one side only, as the same reasoning may be applied to both cases.

1.—*The Force of the Wind.*

The wind-pressure is p pounds per square foot, and is assumed to be uniformly distributed over the height of the wall.

This assumption is not quite correct, as the wind does not travel so quickly at the ground level as at some distance above the ground, the earth having a retarding effect.

The student will, of course, understand the use of letters in the place of figures. As, for instance, when we say the wind-pressure is p pounds per square foot we use the letter p in the place of the actual figure representing the pressure, and, as the letter stands for any number, the arguments, results obtained, &c., will be for any pressure.

Thus when we obtain by the use of several letters in this way an expression or collection of letters representing figures, as the result of our argument we are able to say that this expression or formula will suit any case, and by substituting the particular numbers and values required for the letters representing them we are able to obtain the result for that particular case.

The wind-pressure for various heights and lengths of wall-surface are given in Table I.

Now if we take a portion of the wall 1 foot long it will be evident that the pressure upon every foot of height in this portion will be p pounds, and as the wall is 10 feet in height the pressure on every one of the 10 feet will be p pounds. The wall may be marked in sections 1 foot high, and an arrow representing p pounds placed at the centre of each division as fig. 1.

TABLE I.

Wind-pressures in pounds per super. foot of Plane Surface of Walls in Exposed Positions.—(Adams.)*

Height of Wall,	Length of Wall in Feet.			
	5.	10.	20.	50.
Up to 5 feet	18.4	17.0	15.6	13·9
Above 5 feet and below 10 feet	23.0	21.1	19.5	17.4
,, 10 ,, ,, 20 ,,	28.7	26.4	24.3	21.7
,, 20 ,, ,, 50 ,,	38.4	35.4	32.5	29.1
,, 50 ,, ,, 100 ,,	48.0	44.2	40.7	36.4
,, 100 ,, ,, 150 ,,	54.6	50.3	46.3	41.4

2.—*The Moment of a Force.*

A slight digression must now be allowed. Our readers will all have either seen or read of sailors turning a windlass. Now the sailor knows that he can turn more easily if he pushes at the end of his pole, as at A, fig. 2, than if he worked further towards the centre as at B; in other words the effect on the windlass C depends upon the distance he is

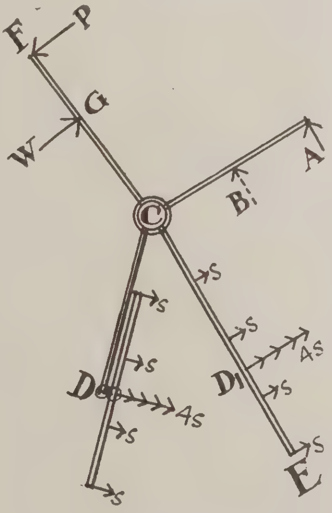

FIG 2.

---

* In protected positions the values of p must depend upon the amount of protection afforded, and those given may be reduced in some cases by as much as 50 per cent. For such ordinary cases it will be found practicable to make the thickness of a common-brick fence wall built in lime mortar one-ninth of its height. The thickness adopted must not be less than this, and, as cutting the bricks would weaken the wall, the next "brick size" must be taken.

away from it, and also, of course, his own strength. His strength (P) multiplied by his distance from the windlass (AC) is the measure of his turning capacity, and is called the "*Moment of the force P, about the point C.*"

Suppose that at the end of another pole—CD—we have a rope which is fastened to the centre of a loose pole upon which four sailormen—S, S, S, S—are pulling, their turning power or moment about C will be the sum of their strengths multiplied by CD. The effect upon the pole CD would be exactly the same if the four sailormen all pulled on the rope fastened to the pole at D. This is repeated in the longer arm CE, and the moment will be S+S+S+S=4S multiplied by CD_1 ; 4S may therefore be considered as acting at D_1 as shown.

3.—*The Overturning Effect of the Wind.*

In fig. 1 all the little forces p may be added together, and one force substituted at their centre and called P.

Then the sum of the moments of p about any point will be the same as the moment of P about that point.

P is the name of our sailorman, AB is the windlass; and the distance he is away from the windlass, or the length of the "lever arm," is $\frac{h}{2}$ (where h = the height of the wall). The overturning effect of P with regard to the joint AB will be, then, $P \times \frac{h}{2}$.

This "moment," containing two different kinds of measurement (feet and pounds) is measured by both, and expressed in "foot-pounds," "foot-tons," "inch-pounds," &c.

4.—*The Weight of the Wall.*

Fig. 3 represents the portion of the wall above the ground line, AB being enlarged so as to make the working clearer.

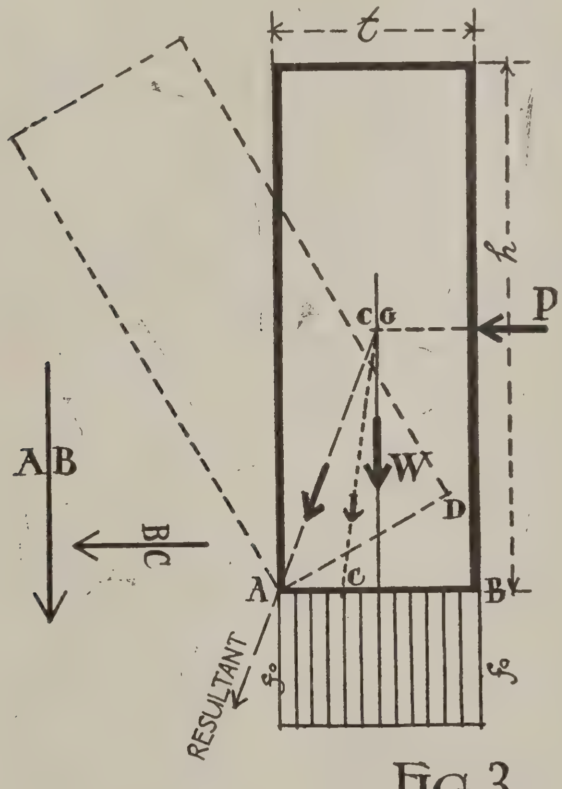

FIG. 3

If this wall had been constructed of some very light material—as hay or straw, for instance—it would have very easily been blown over. It depends upon its weight, therefore, for its stability. Now the weight of an object is a force acting vertically downwards through its centre of gravity.

The centre of gravity of a body is a point such that, if the object were suspended by a cord fastened to that point it would remain at rest. In regular shapes the point is at the centre of the shape, provided the material be of uniform density. For example, the centre of gravity of this sheet of paper is at its centre of area.

In the same way the weight of the wall may be considered as a force acting vertically downwards through its centre of gravity CG, as shown in fig. 3.

5.—*The Stress on a Joint due to the Weight of the Wall.*

The joint AB will be required to support the weight of the wall above it, and therefore must be of such strength that it will not be crushed by this weight. As different materials resist crushing to different extents their resistances are compared by taking a super foot of each and tabulating the loads required to crush this area of each.

Then as these loads have been obtained upon picked pieces of the material or carefully prepared joints, &c., the results thus obtained must be considerably reduced before being taken as the actual resistance to crushing of any actual piece of work; and as it is impossible to foresee the actual load coming upon any piece of work, owing to unequal settlement, &c., and, as the workmanship may only be calculated upon as being of the average standard, these loads must be again reduced.

In practice, instead of reducing the loads in this way the "crushing load," found by experiment, is divided by a number called the "factor of safety," which varies for different materials and different cases.

The load thus obtained is called the "safe load," and if it is upon the unit area—per square foot, per square inch, &c.—it is termed the "safe stress." (*See* Table II.)

In fig. 1 the load on AB = length × breadth × height (all in feet) × weight per cubic foot of the material.

$$= 1' \times 1'.5 \times 10' \times 1 \text{ cwt.} = 15 \text{ cwts.}$$
$$= \text{load on a joint } 1' \times 1'.5.$$
$$= \text{load on } 1'.5 \text{ square feet.}$$
$$\therefore \text{Stress per square foot } f_0.$$
$$= \frac{15 \text{ cwts.}}{1'.5 \text{ square feet}} = 10 \text{ cwts.} = \tfrac{1}{2} \text{ ton.}$$

We can represent this stress (f_0) as in fig. 3, by drawing a line parallel to AB at a distance of half a ton to some scale, say one ton to 1 inch, then f_0 will be ½ inch, and the stress f_0 may be measured at any point in AB and will be half a ton per square foot.

Table II.

Average Compressive Strengths and Weights of Materials.

Material.	Safe Dead Load per Superficial Foot.	Factor of Safety.	Weight in Pounds per Cubic Foot.
	Tons.		Pounds.
Granite masonry . . .	15	20	160
Portland and hard limestone	15	15	140

6.—*The Distribution of the Stress.*

It follows that the distribution of the stress is uniform over the joint AB. The crushing at A is the same as at B or any intermediate point.

(*To be continued.*)

THE EARLY STAGES OF A TOWN PLANNING SCHEME.*

I LITTLE thought that when I became Clerk to my Council upon the formation of the District in the year 1904 they would be the first Urban District Council to take action in so important a matter as Town Planning, and I certainly did not, when the discussion took place at the Conference held at Ilfracombe last year, anticipate that the burden of introducing the subject this year would fall to my lot.

My Council, however, has been the first Urban District Council to obtain authority from the Local Government Board to prepare a town planning scheme, although the

---

* A Paper read by Mr. Edmund R. Abbott, solicitor and clerk to the Urban District Council of Ruislip-Northwood, at the annual conference of Urban District Councils of England and Wales at the Guildhall, London.

Corporation of Birmingham had previously obtained such authority in respect of two areas.

Before proceeding further perhaps I ought to say a few words as to the nature of my Council's district. It consists of 6,585 acres of land, and a population at the recent census of 6,217, with a rateable value of £52,000, and a net assessable value of £46,000. The general district rate is 3*s.* 10*d.* in the £. The whole of the district is within fifteen miles of London.

I suppose that in taking up the matter of town planning, the first question which will present itself to members of Councils and their officers is whether their district is one in which any action under Part II. of the Housing and Town Planning Act, 1909, can be properly taken at all. If the district is practically all built over, then probably little can be done. This part of the Act (Section 54) relates to the making of town planning schemes as respects any land which is in course of development or appears likely to be used for building purposes. If there is no land of this description, it seems useless to take action, as the Local Government Board have only power (under Section 54, s.-s. 3) to include in the area of a scheme land already built upon, or land not likely to be used for building purposes if it is made to appear to be so situated with respect to land likely to be used for building purposes that it ought to be included in any town planning scheme made with respect to the last-mentioned land. Therefore the necessity for a scheme will to some extent depend upon the area of land undeveloped in the area of the Council, although it must not be forgotten that a Council is quite at liberty to apply for authority to prepare a scheme for land outside its own area (under sub-section 2). In fact, I believe in the case of Richmond this is being done for the purpose of preserving the amenity of Richmond itself.

One of the next points to consider is when is the proper time to commence action. I am strongly of opinion that no time should be lost in taking the first step, because under the Act and regulations of the Local Government Board considerable intervals must elapse between the several stages, and until actual proceedings are commenced practically nothing can be done to prevent development on lines which would not be in accordance with a town planning scheme. The first step is certainly to appoint a special Committee, as there is a large amount of detail work to be done, and it is quite impossible for another Committee to attend to it in conjunction with other matters. A resolution should be passed by the Council under Article 1 of the Procedure Regulations of the Local Government Board that at the expiration of a period of not less than two months the Council will consider a formal resolution to make application to the Local Government Board for authority to prepare a town planning scheme.

Now I shall assume that all those present have read Part II. of the Act and also the Memoranda and Procedure Regulations of the Local Government Board.

The area when determined by the Council is defined upon Map No. 1.

This is of vital importance, because once settled by the Council and the map deposited for inspection under Article 1 of the Regulations, the area cannot be added to. Once the Local Government Board have sanctioned the preparation of a scheme in respect of a particular area, no land can be excluded. The Conference will therefore at once see that this question of area must receive the most careful consideration at a very early stage.

The following points arose in connection with the Ruislip-Northwood scheme:

(*a*) Inclusion of land in an adjoining rural district.

(*b*) Land already built upon.

(*c*) Land alleged not to be likely to be used for building purposes.

(*d*) Land included in a scheme for the purpose, to some extent, of the amenity of neighbouring land not included in the area of the scheme.

(*e*) Land divided into numerous plots, some of which were sold, or in respect of which contracts had been entered into.

It will probably be thought at first sight to be desirable to include the whole of a Council's district in the area, but this is no light matter when it is considered that seven sets of notices have to be served upon all owners, lessees and occupiers. Moreover, it is quite likely that with regard to large areas of land fully developed, even if the Local Government Board allowed the Council to include it, nothing whatever could be done under the scheme with reference to it, and in addition considerable expense would be incurred and unnecessary trouble and annoyance caused to a large number of ratepayers whose co-operation must also be secured.

At both Birmingham and Ruislip-Northwood land forming portion of an adjoining district was included in the area which was the subject of the application to the Local Government Board. In the latter case the Rural District Council objected, and its objection was supported by the County Council. It is clear that if a case is made out the Act contemplates the inclusion of part of the area of another local authority. Ample provision is made for the "responsible authority," i.e., the authority responsible for the observance of the scheme and for the execution of any works under the scheme to be executed by a local authority, being the authority which prepares the scheme, the authority in whose area the land is situated, or for certain purposes one authority, and for certain purposes the other, or a joint body. I may say here that Urban Councils must be careful as to their neighbours if they are Rural authorities. My district abuts on the areas of three such authorities; in one case it was stated by a prominent member that the Act was not applicable to Rural areas, and in neither of the others, although practically of the same character as Ruislip-Northwood, has any action been taken at present, nor does it seem likely that it will be, at any rate for some time to come.

I would impress upon the representatives of local authorities not to be jealous of one another in this matter. Co-operation is the keynote of the Act. The particular Rural Council a portion of whose area was included took the view that town planning was in an experimental stage, and they would, perhaps, learn a little from the mistakes of others. I hope this view will not be held largely, but rather that Councils will co-operate in trying to construct the best possible schemes.

Coming to two special kinds of land, viz., a piece of land already built upon, and land not likely to be used for building purposes, it will devolve upon the local authority to make out a case to the Local Government Board that it is reasonable to include it in the scheme.

With regard to land already built on, in many districts emerging from the rural to the urban stage will be found old cottages, farmhouses and property of that nature, and large houses with grounds of several acres which have gradually been built round. All these, while they exist in their present state, probably add picturesqueness and amenity to the locality, but once development begins they may have an opposite effect, and in the case of subsequent sale may form serious blots upon the scheme.

In passing, I may remark that these expressions—land likely or not likely to be used for building purposes—occurring in the Act are most difficult to construe. First, "Land not likely to be used for building purposes." Can it be said that such land exists in an urban district? Can it be said that such land exists within, say, 20 or 25 miles of London, or 10 miles of any large towns?

In most districts which are contemplating taking powers under the Act there is some actual development. I mean that an estate has been plotted and a few plots sold with houses already erected here and there, and development is going on at the present time. It is no good including land of this character, unless the authority is prepared to deal with it in some way, and there may be 40, 50, or more owners to deal with, and fear of compensation. I think, however, it is best to include such land, and, after all, a little negotiation may produce good results, especially remembering that, if it is made to appear to the Local Government Board that it is reasonable, there is no compensation in respect of the limitation of the number of houses to the acre, and this is perhaps the most important provision of the whole Act.

Another point, as regards area, is that where some land is omitted and other land near by included, it at once raises the question why this is done. The reason may be perfectly good, but it will raise suspicion in some minds. In the Ruislip-Northwood case the question was definitely raised that some land had been included for the purpose of getting over a point of law under an existing Act of Parliament.

The first sub-section of Section 54 expressly authorises the inclusion of land for the purpose of the amenity and convenience of neighbouring lands not necessarily in the area of the scheme. For instance, land subject to restrictive covenants may adjoin unrestricted land. The whole of the restricted land may be developed and the owners may live more or less in dread of what may happen to the unrestricted land. To prevent this is one of the objects of the Act.

I need hardly say that several of the above points were not present to the minds of the Council or their officers when first they were dealing with the question of area, and it is to some extent only in the light of subsequent events that I have been able to put them before the Conference.

The area fixed by the Council was 5,859 acres out of the 6,585 acres comprising the Council's district, and, in addition, 63 acres in the adjoining Rural district, making a total of 5,922 acres.

The area having been settled, Article II. comes into force. This provides for service of notice of the proposal to apply for authority to prepare a scheme being given within seven days after the Council have decided to consider such proposal upon any Council interested in the land in the proposed area. There is no doubt that this would apply to the Council of the area outside the Council's district already referred to, a portion of whose area is included in the scheme, but does it apply to any other Council owning, say, a cemetery or sewage farm within the proposed area? I thought it safest to serve a Council in that position. The next step was to obtain the names of the owners, lessees and occupiers of the land included in the area. They are probably not known with any degree of accuracy, and what is really involved is the preparation of a Parliamentary Book of Reference.

Acting on the precedent of the Standing Orders of Parliament, I did not intend to serve notice on any occupier of property whose interest was less than that of a quarterly tenant, although the names of most of them had been obtained. As a matter of precaution I sought the advice of the Local Government Board, who informed me that they did not consider that the analogy of the Standing Orders of Parliament must be acted upon. I thereupon made an application to the Board, under Article 34, to dispense with the service of notices on occupiers whose interest was less than that of a quarterly tenant, and I received an Order of the Board dispensing with such service, not only of the intention to apply for authority to prepare a scheme, but throughout the proceedings on the scheme. This will, of course, save a large amount of time, trouble, and expense. Article I. of the regulations says that the notice "shall describe the land proposed to be included in the scheme." Now it is not easy to describe about 6,000 acres of land, with its boundaries so as to make the description intelligible; it therefore seemed to the Council that the only course was to annex a plan to each notice, and this was decided upon. Copies of Map No. 1 on the smaller scale of 6 ins. to the mile were lithographed and coloured in a similar way to Map No. 1. The notices were prepared, plans annexed, and served, and an advertisement inserted in a local paper giving notice of the intention of the Council to apply for authority to prepare the scheme, and of the deposit of the Map No. 1 at the Council office.

Now came an extra formality in order to comply with Article I. (*d*), which says that a certified copy of Map No. 1 is to be furnished to the Council of any borough or urban or rural district within which any part of the land proposed to be included in the scheme is comprised. Another copy of Map No. 1 had therefore to be prepared—we were advised that, although only 63 acres of land in the adjoining district was included, we must give a copy of the *whole* of Map No. 1—and this was accordingly done, although it involved the use of about twenty Ordnance sheets.

Article III. provides that at least one conference with landowners must be held before the application to the Local Government Board is made, and fourteen days' previous notice must be given. In order to save trouble and expense the notices of this conference were despatched with the notice of the intention to apply to the Local Government Board for authority to prepare the scheme. The conference was duly held, and a large number of persons interested attended. The Chairman of the Council presided, and the Chairman of the Town Planning Committee explained the procedure to be adopted.

Pending all these proceedings, Map No. 2 was in course of preparation.

The particulars that are about to be shown on Map No. 2 are set out in Articles IV. (b) and VI. They are as follows:—(1) Land in Council's area; (2) land in area of any other Council; (3) land already built upon; (4) land not likely to be used for building purposes; (5) positions of any buildings erected or in course of erection on the land; (6) lines and widths of proposed principal roads, and their connection with existing roads; (7) sewers, gas, water, and electric mains; (8) roads or ways to be diverted or stopped up; (9) areas for open spaces or special purposes. Application was made to the Local Government Board for permission to combine in the copy of Map No. 2, which has to be sent to the Local Government Board, the information given upon Map No. 1, thus saving the cost of one map. This application was granted.

In connection with Map No. 2, two points have been raised upon the regulations: (1) As to showing suggested roads; (2) as to provision as to sewerage. Obviously there is not very much difficulty in fixing the main through roads, and these must be connected with all railway stations and centres of population; hence some other roads will fall into the scheme almost automatically. It must be remembered that this is only a rough outline of what is proposed, and does not bind the Council absolutely. As regards sewage disposal and sewerage, a most important matter, the surveyor to any Council will probably be able to tell very quickly whether the existing works will be available, and, roughly, what may be necessary, and this is all that is required.

The next step was to prepare the statement under Articles VIII. and X. of the regulations, to be sent to the Local Government Board with the application, and here the most difficult point to deal with is "the reason for including in the scheme land not likely to be used for building purposes." The definition in the Act of "land likely to be used for building purposes" is extremely wide, and ultimately it appeared that the only lands in the whole area which came within the definition of land not likely to be used for building purposes were those occupied by the actual railway lines and works of the various railway companies.

This, of course, will differ in different districts. Map No. 2 is not a document open to public inspection, although it is open to the inspection of persons interested in the scheme. It must be borne in mind that it merely contains the ideas (not the scheme itself) of the promoters as to what they have in view. In fact, its intention appears to be to show that the Council have a *primâ facie* case in accordance with the Act, and that they have really *bonâ fide* considered their proposals.

With regard to Map No. 3, it is a one-inch scale map, and has to show by boundary lines the area within five miles from any part of the Council's district. Another point is the question of the estimate of cost. Obviously, and admittedly by the regulations, this can only be approximate, and this is all that can be given.

I am of opinion that in the estimate of cost it is proper to include so far as possible the approximate amount of any compensation which is likely to be payable, and also to take credit for any sum which may be received by way of betterment if either of these can be estimated at all.

The formal resolution applying to the Local Government Board for authority to prepare the scheme was passed and duly advertised in local papers. All the documents were lodged with the Local Government Board on the day succeeding the passing of the resolution.

The date of the passing of the resolution (which is the formal application) is the most important date of all, because under Section 58, sub-section 2, "A person shall not be entitled to obtain compensation under this section on account of any building erected on or contract made or thing done with respect to land included in a scheme after the time at which the application for authority to prepare a scheme was made or after such other time as the Local Government Board may fix for the purpose."

The result of this is that every road made, every house built or other work done upon the land will be subject to the scheme when made, and the Council have as from the date of the application control over the development of the area of the scheme so far as the Local Government Board authorises its inclusion.

Within one month of the application an inquiry was held by the Local Government Board into the matter of the application. There were some six objectors—the County Council of the county in which the outside area was included, the Rural District Council of that area, and four landowners, who objected to their property being included in the area of the scheme. The County Council's representative contended that the county was the natural boundary for all purposes and should not be interfered with. The Rural District Council opposed generally on the ground that it was inconvenient to have two authorities with rights in one area.

The objections by landowners were only in respect of small portions of the proposed area, and were rather on the lines of the ultimate user of the land than its actual inclusion in the area of the scheme. The object of the inquiry was stated by the Inspector to be whether there should be a scheme or not, and, if so, what the area was to be. He absolutely declined to go into the question of what was to be done on or in connection with the land under the scheme. It is quite clear that if a landowner desires to be uncontrolled in his development he will make a great effort to get his land ex-

RESIDENTIAL FLATS AT MILAN.—Signor J. N. Urata, Architect.

cluded from the area. It was urged by counsel, on behalf of one landowner, that the burden of proof was upon the Council to show why land should be included, but my view is that if the land falls within Section 54, sub-section 1, the burden is upon the landowner, and I think in most cases it will be difficult for him to convince the Local Government Board that he ought to be excluded.

As a result of my Council's application, authority was given to prepare a scheme in respect of the whole of the area included in such application, with the exception of a small area of about 15 acres which the landowner stated he had no intention of developing, and, moreover, which formed part of a large estate in an adjoining district. This leaves about 5,907 acres to be planned.

My Council were quite satisfied with the result of their application, and I venture to think that this result was also satisfactory as a guide to other authorities, as the following principles have been established, namely:—That the Local Government Board are quite prepared in proper cases to authorise the preparation of schemes, including:—

(1) Land outside the area of the Council—this has been already done both at Birmingham and Ruislip-Northwood.

(2) Land already built upon.

(3) Land alleged not to be likely to be used for building purposes (*e.g.*, railways).

(4) Land for the purpose of securing the amenity of lands outside the area of the scheme.

The authority having been given, notice thereof has to be served upon all lessees, owners, and occupiers of the land included in and excluded from the scheme.

The actual preparation of the scheme must now be taken in hand, and the first step to be taken is to prepare Map No. 4, which must show in different colours the boundaries of the properties of the various landowners.

Of course it is desirable to secure the co-operation of landowners at this stage, and accordingly with the last-mentioned notice my Council enclosed a letter enquiring whether the landowners had any scheme of development in view, and, if so, desired them to furnish particulars, as naturally a Council would prefer that this should be done by the landowners rather than that it should devolve upon the Council to really plan the whole area.

My Council have already received several schemes of development from landowners, and they are now actively engaged in considering them. Immediately any such scheme is received a fresh notice is sent to adjoining owners asking for their schemes (if any), in order that their co-operation may be secured.

It is obvious that a scheme dealing with so large an area must necessarily take several months to prepare, and pending the preparation several landowners desire to proceed with selling their land. It seems that the only course to adopt is to enter into an agreement with the landowner, which will be subsequently scheduled to the scheme, and if no actual relaxation of bye-laws is required there is no reason why the landowner should not proceed with his sale and development directly the agreement is executed.

The agreement would probably deal with the following matters:—

(*a*) The area of land belonging to the landowner.
(*b*) The number of houses to the acre.
(*c*) Through roads.
(*d*) Provision of open spaces.
(*e*) Class of buildings.
(*f*) Building lines.
(*g*) Prohibition of advertisement hoardings and bill posting.
(*h*) Proportion of land occupied by buildings to curtilage.
(*i*) Compensation.
(*k*) Planting and cutting down of trees.
(*l*) Height of fences or walls.

If it is desired that bye-laws should be relaxed this can only be done by the scheme itself; a Council has no power to relax bye-laws by agreement. This point is very important, and it would be well to secure by the agreement a provision for the alternative carrying out of the development in case the scheme ultimately fails to provide for such relaxation.

To show what can be done by agreement with landowners, I may mention that in the first completed agreement the landowner has agreed to give up to the Council free of cost over two acres of land out of a total of 28 for the purpose of open spaces, and in another case about seven acres out of 80 have been secured for open spaces in the same way.

Within the limits of this paper it is of course impossible to deal with all the above matters which may form the subject of an agreement and ultimately of the scheme, but I hope that many of them may receive attention during the discussion on this most important subject, particularly the question of the number of buildings to the acre, the provision of shopping centres, and the setting apart of land for special purposes.

I have refrained from suggesting the passing of any resolution by the Conference, as I gather that the object of the Executive Council in placing the matter upon the agenda in so prominent a position is in order to obtain a full discussion and to clear up difficulties (of which there are many) rather than the adoption of any definite proposals.

ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.

At the annual general meeting of the Society, on January 31, the following report of the Council on the proposed Charter of Incorporation was, on the motion of Count Plunkett, seconded by Dr. Berry, unanimously adopted:—

With reference to the notice of motion given by Mr. Richard Langrishe, J.P., at the last quarterly meeting of the Society held in Kilkenny, the Council have to report that the advantage a Charter of Incorporation would confer has for many years presented itself, but, more recently, its necessity has become pressing. It was an object which the original members of the Society had always before them; and it appears to the Council that opportunity should be availed of at the present time to give effect to a matter of such importance to the progress and advancement of the Society.

It is hardly necessary to say that the important position the Society has attained to in the archæological world, and the increasing interest taken in, and importance attached to, archæological science, sufficiently indicate the necessity for this step.

The practical advantage to be obtained by a Charter is that it would enable the Society to acquire premises in its own name, and under its seal. At present the purchase, renting, or acquisition of premises has to be effected by individual members in their private capacity, and the funds of the Society have to be invested in the same unsatisfactory manner. The property of the Society, in its valuable collection of antiquities, is another item; and the ultimate provision for these objects may necessitate the preparation of a legal document, which should be perfected in the name of the Society as a Corporation, and not in the names of individuals who may at any time cease to be members.

The Council have had a draft petition prepared, and have ascertained that the cost of the fees in connection with the Charter would be about £150; and, in order to meet this cost, it is proposed that such as are willing to become signatories to the petition should contribute to the expense; and if additional funds are required, they could be obtained by suspending the publication of the extra volume for the year 1911-12; and in this way there would be no appreciable tax on the funds of the Society.

As regards the revision of the "rules," it is considered desirable that the proposed Charter should not contain anything repugnant to the "rules" as they now stand, and that as soon as the Charter is obtained, instead of the mere "rules," as they are called at present, they should be revised as "by-laws" under the Charter; and it is proposed to bring the revised "by-laws" before the Society for approval at the next general meeting after the date of the Charter.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Sirapite Plaster.

Sir,—The letter of Mr. Thomas J. Collins in your last issue is undoubtedly interesting, and is quite an innovation I think. I should have been interested to know whether the experiment was satisfactory; perhaps your correspondent can gives us this information. The amount of £4 10s. per week to "look after the job" makes the mouth water of—Your obedient servant,

An Architect's Assistant.

The Architecture of London Highways.

Sir,—May I crave the indulgence of a few lines in your correspondence columns to explain one or two apparent inaccuracies in my contribution on "Architecture of London Highways"? It was written about a twelvemonth ago for use within a brief period from the date of writing; but I know how deep was your grief when you found yourself compelled to hold it over for "want of space." Ah! that want of space! how it recalls the bitter plaint of many artists whose noble canvases (10 inch by 8 inch, frame included) have been rejected by the Royal Academy solely for this reason. But enough! what concern have I with disappointed artists? All my concern is that I did not avail myself of your kindly forewarning, that you were about to use my long-time pigeon-holed article, and ask your permission to revise it as necessary. But the gnawing tooth of time (to which I refer therein) apparently fed on my memory. *Hinc illae lachrymae!* With all respect,—Yours,

Viator.

P.S.—What an interesting letter is that of Mr. T. J. Collins. But I fear in many English buildings the overhead method of plastering would not be feasible.

A faculty has been granted in the Consistory Court of York for the erection of a carved oak screen and rood at the entrance to the chancel of the church of St. Mary, Lowgate, Hull, "in memory of King Edward VII., the Peacemaker."

In the course of restoration work at the Moot Hall, Hexham, a small chamber was brought to light in the west wall of the main room, about 9 feet long, nearly 2 feet wide, and about 5 feet high. The chamber is lighted by a small north window.

FORTHCOMING EVENTS.

Saturday, July 29.

Northern Architectural Association : Students' Sketching Club.

Manchester Society of Architects : Visit to Mobberley. Leader, Mr. Isaac Taylor.

Institution of Municipal Engineers : Annual Meeting at Edinburgh.

Monday, July 31.

Royal Archæological Institute : Second half of Summer Meeting opens at Tenby.

Tuesday, August 1.

Manchester Society of Architects : Visit to new Bank Premises, Piccadilly. (Messrs. T. Worthington & Sons, architects.)

Monday, August 7.

Royal Society of Antiquaries of Ireland : Ulster meeting opens at Belfast (closes August 12).

Northern Architectural Association : Students' Sketching Club Annual Excursion.

Tuesday, August 8.

Guild of Architects' Assistants : Visit to London Opera House, Kingsway (Mr. Bertie Crewe, architect).

STUDENTS' WORK IN LONDON.

THE simultaneous exhibition of the sessional work by students at two of the architectural training schools in London naturally provokes comparison between the Architectural Association and the University College School of Architecture. The Association exists entirely for the education and improvement of architectural students, whilst at University College architecture is but a minor branch of University teaching. The latter, too, has been but lately established as an actual training school, although for several generations there have been delivered excellent lectures by eminent professors.

As the Architectural Association is the older school, and, at present, the more numerously attended, we will first consider the work there exhibited. This is in two main divisions, that of the Day School and that of the Evening School. The former is intended to provide instruction of a character to fit an embryo architect fresh from school or college to become an articled pupil in a practitioner's office with a better capability for taking advantage of his term of pupilage than if he had not received such preliminary training. The Evening School is for those who are already engaged during the day, and whilst provision is made for novices, it also forms a continuation school for those who have passed through the Day School.

In the Day School the young aspirant is taught in his first year to draw, by copying geometrical drawings of old work and modern work, as well as by making freehand drawings of carved ornament and of models. Some of the sketches of woodwork are well executed, but there is a little too much importance attached to outline and too little to shading. It is clear that from the very first students at the Association are taught and encouraged in practising smart draughtsmanship and tricky effects of pencil and brush. It is remarkable how soon in their career the young students at the Association acquire quite respectable ability in draughtsmanship, as evidenced by their vacation work in measuring and drawing old buildings. The quaint town hall at Fordwich has been measured by Mr. H. B. Tunnard and Mr. R. S. Johnson, and that at Amersham by Mr. R. S. Wallace; a barn at Harmondsworth has formed the subject of Mr. H. G. Satchell's study, and another at the Wick Farm, Headington, of Mr. H. J. Tebbutt's. The best, in our opinion, of the vacation studies, both in importance of subject and in excellence of endeavour, is a set of drawings by Mr. E. Cecil Davies, of Haunt Hill House, Weldon, Northants. An admirable feature in the study of wrought-iron work has been impressed upon the students, the representation in perspective of a piece of detail, thus impressing the importance of studying the width of strap iron, which is apt to be overlooked in a strict elevation.

In the second year of the Day School the students are allowed to make designs based upon ancient architecture, Greek, Roman, Byzantine, Mediæval, and "Traditional English Stonework." A design on modern lines is also allowed, and that of Mr. D. J. Gordon, the winner of the first prize for the session, for a cottage at Romford in tile and red brick, is quite as pretty as many of those at Gidea Park. Mr. Gordon's sketches of carved detail in pencil are good examples of shade drawing, expressive and smart, without being unduly laboured.

As usual at the Association, it is difficult to find out the names of the authors of the drawings, because space and pins are economised by covering up the right-hand bottom corners. The same economy might be obtained by covering the left-hand top corner, and the usual place of signature would then be revealed. The hanging should be entrusted to a writer of Hebrew or Chinese, or a strongly left-handed draughtsman, and then this little arrangement might come out all right. We did, however, notice a good design for the Byzantine church by Mr. Geoffry Fildes, and a noteworthy pencil shaded drawing of detail by Mr. H. Fellowes Prynne. It is, perhaps, hardly fair to criticise the plans of two-year-old architects, but those of the prize-winners for the Village Club that formed the test subject at the end of their course are deficient in safety, though prettily drawn. They, in fact, epitomise the work of the Association Day School, which in two years very creditably turns out wonderfully smart draughtsmen, but does not make architects. Not that we should expect it would or could.

In the Evening School the drawings are markedly inferior to those produced in the Day School till we come to the third-year students; but amongst those of the second year the design of Mr. F. P. Spooner for a fountain, of Mr. G. Macgregor and Mr. A. E. Maxwell for a library, and of Mr. T. F. H. White for a school memorial hall give promise for the future.

The third-year work contains some really creditable designs, notably those of Mr. A. B. Ll. Roberts, the first prize winner, whose clever drawing of a fountain is a wonderful piece of brush work in water-colour. Mr. G. W. Stuart's design is good, though of a more correct and formal type. Mr. Adrian Hardman has an excellent detail drawing of his library design, and there is also some good work by a gentleman with an illegible signature.

The students of the fourth year are sufficiently advanced to be able to design with some degree of success, Mr. H. V. C. Curtis, the first prize winner, contributing designs for a bridge and approach and for a garden pavilion that are quite good. His boathouse is, however, not so satisfactory as are designs for the same subject by other students. Mr. F. A. Crouch, the winner of the second prize, has made some good drawings, and his designs for a lamp standard and the garden pavilion are of a high quality

At University College architecture and not draughtsmanship appears to be the goal towards which students are directed, but in the work of Mr. E. Musmann, a student who is working for the degree of B.A. (Honours in Architecture) at London University, there is draughtsmanship of a calibre far exceeding in excellence anything to be seen at the Association. His study of a panel from a Burgundian carved oak door is a marvellous piece of pencil work, his studies from the life, tinted sketches of old woodwork, and his water-colour sketches have real intrinsic quality without any approach to smartness or prettiness. Mr. Musmann's measured drawings of the Ashmolean and Taylorian Institute, Oxford, are a careful and thorough study of Professor Cockerell's treatment of Greek detail that is reflected in Mr. Musmann's design for a town club-house.

For the first prize for work in the school Mr. Stanley R. Miller and Mr. Charles Voysey are bracketted equal, and their designs for a large country mansion, a free library, and a fountain evidence the tendency of the students generally to design on the lines of the eighteenth century designers in the grand manner and the Anglo-Greek of Cockerell, with some infusion of modern French neo-Grec feeling. This latter tendency is strongly shown in the work of the third prize winner, Mr. L. Douglas Meadows. Although there is a distinct leaning towards the stately Classical, if somewhat formal, type of English architectural design, it is clear that there is no compulsion on students in this direction, for Mr. S. W. Sherren affects the seventeenth century and Mr. A. Collier James the eighteenth century work of Kensington. The prize winners, as well as those who receive honourable mention, Mr. Victor Bain and Mr. T. A. Jones, all follow the Classicism of the Dilettanti period. A special prize is given to Mr. Victor Bain for his measured work.

NOTES AND COMMENTS.

As might have been expected, the London County Council have been unable to attract the *rara avis* who should possess the dual qualification of high artistic ability and a power of organisation and administration sufficient for a principal of the L.C.C. Central School of Arts and Crafts, and the Education Committee has therefore presented the following report with a view of overcoming the difficulty: The Council on February 14, 1911, authorised the employment of a full-time principal of the Central School of Arts and Crafts at a salary of 1,000*l*. a year in the place of the present part-time principal, who wishes to retire as soon as a successor can be found. In accordance with this decision an advertisement was issued, by the terms of which candidates were required to possess high qualifications as practical artists, and to produce evidence of administrative and organising ability. Forty-six candidates sent in applications with statements of their qualifications and experience. After careful examination of the statements sent in, nineteen candidates were interviewed by Sir George Frampton, R.A., the Council's art adviser, Mr. G. Clausen, R.A., Mr. Emery Walker, Professor Moira, members of the visiting committee of the L.C.C. Central School of Arts and Crafts, and the Council's officers, with the result that we were advised that no candidate satisfied the joint requirements as to artistic and administrative qualifications. It was apparent, on the one hand, that the practical artists either were not prepared to give the necessary time to the administrative duties of the post, or had not had sufficient experience for such duties. On the other hand, those candidates who had devoted themselves mainly to the business of organisation of a school of art had found the demands on their time so great that their own work as artists had suffered. We have arrived at the conclusion, therefore, that we cannot assure the Council that any single candidate has the qualifications required by the advertisement. We have considered, therefore, an alternative proposal—namely, that the difficulty should be met by the appointment of two officers—(1) a part-time principal to attend on six sessions a week, who would be solely responsible for the complete direction of the art work of the school, and (2) a full-time business manager, with the title of vice-principal, who would be responsible for all the administrative work of the school and its relations to students and manufacturers. We are of opinion that, having regard to the fact that no single candidate appeared suitable for the appointment as advertised, the object aimed at could be attained by appointing a principal with special art qualifications and a vice-principal with administrative qualifications. We have very carefully considered as to the salaries to be attached to the two positions, and we have decided to recommend that salaries of £700 a year and £600 a year should be attached to the position of principal and vice-principal respectively. Our proposals involve no additional expenditure during the current financial year, but there will be an additional expenditure of £300 in future years.

Although the bestowal of a knighthood on Mr. R. S. Lorimer may primarily be regarded as a token of appreciation of his fine work in the Chapel of the Order of the Thistle added to St. Giles's Cathedral, it is also a fit recognition of the art of architecture in Scotland as represented by a worthy exponent. Mr. Lorimer is a son of the late Professor Lorimer, of the University of Edinburgh. Born on November 4, 1864, he was educated at the Edinburgh Academy and the Edinburgh University. He entered the office of Sir Rowand Anderson as a pupil in 1885, and served with that architect for four and a half years. After travelling in England, he entered the office of the late George Frederic Bodley, R.A., where he had much experience of ecclesiastical architecture. Mr. Lorimer was with Mr. Bodley for a year and a half. Since he returned to Edinburgh he has been engaged largely on country houses and restoration work, including the restoration of Earlshall and Leuchars; the designing of a large house in Argyllshire—Ardkinglas—for Sir Andrew Noble, Bart.; the restoration of a mediæval castle in Kent for Mr. F. J. Tennant; and the restoration of Dunderawe Castle for Sir Andrew Noble. Mr. Lorimer restored The Glen and Monzie Castle after their destruction by fire, and in the Royal Scottish Academy's exhibition this year he is represented by drawings of Rowallan, a beautiful castellated mansion in Ayrshire he has planned for Lord Rowallan. He was elected an Associate of the Royal Scottish Academy in March 1903.

The report of the Departmental Committee of the Board of Education on the cost of school buildings, which was published a short time ago, appears likely to cause a considerable waste of time in discussion and some ill-feeling perhaps, as in the case of the Westbourne Schools, West Sussex. The fact is that it is not easy to apply the recommendations of the report in all cases with any great success in attaining economy except at the cost of durability. The West Sussex County Council has at any rate decided that the new Westbourne Schools shall be built in brick, at an estimated cost of £11 7*s*. 2*d*. per place for 310 children.

Opposition is a natural accompaniment of interest in public affairs, whether national, municipal, or parochial, for on no given subject will all men think alike unless they are too apathetic to think strongly. Hence when the Wallasey Town Council propose to follow the successful example of Cardiff and build their new Town Hall in Central Park, there need be no surprise that a meeting has been held to protest against such a deprivation of open space, forgetting that a beautiful building will increase the charms of the park, whilst its own merits will be enhanced by its setting.

A very interesting and instructive report on the health of Birmingham in 1910 has just been issued by Dr. Robertson, Medical Officer of Health for the city, in which he states that the year 1910 establishes a record for general healthiness. On the whole, fewer people have died per 1,000 of the population than ever before in the history of Birmingham, and the preventable diseases have declined in a marked and satisfactory manner. He believes it is quite correct to say that Birmingham is shown to be the healthiest large manufacturing city in Europe where a strictly accurate comparison can be made. For forty or fifty years the statistics have been increasingly fallacious, in that they represent all the unhealthy portion of Birmingham and only part of the healthy. The extension of the city boundaries, work which occupied so much time during 1910, will put Birmingham in its proper place in the future, as not only a very large and populous city, but as the healthiest of the large manufacturing towns in this country. The mortality rate for 1910 in Greater Birmingham, based on the corrected population, was 13.1 per 1,000, as compared with 17.2 per 1,000 in Glasgow, 15.8 in Edinburgh, 16.2 in Manchester, 18.3 in Liverpool, and 14.2 in Sheffield. While the record for this district is one of the best that he knows of for a manufacturing town, one cannot but see that the mere size of the city shuts in, in the central districts, large numbers of persons in areas where clean air, clean surroundings, and clean houses are practically impossible. In such areas there still are mortality rates of 21 and 22 per 1,000, with enormously high and expensive sickness rates. "To effectively deal with these areas, and particularly with that part of the population amenable to betterment, the policy which was originated in Birmingham of housing and town planning is, he believes, thoroughly sound, and will lead eventually to good results. He has watched very carefully during the past year the progress of the movement known as town planning, and suggests that the greatest care should be taken in the city to make it conduce to the common good rather than to those architectural and æsthetic results which will benefit mainly the better artisan classes, who can and do look after themselves. Attention has up to now been directed to the laying out of new roads and limiting the number of houses in suburban areas. This is, of course, essential, but equally important for the prosperity of the city, and therefore for its communal welfare, is, firstly, the giving of business facilities to manufacturers and others, on whom the prosperity of the town depends; and, secondly, the getting rid of areas where squalid dwellings are dovetailed in between smoky and otherwise objectionable works. There seems to him to be no insuperable difficulty to prevent all such works being removed in time from the precincts of the areas occupied by dwellings."

An interesting discovery has been made at Fotheringhay in connection with the Castle Stone, to enclose which with a light iron railing a fund has been collected by the Peterborough Archæological Society. It had long been suspected by the Secretary of the Fund (Mr. Frank Loomes) that the underpart in the ground would support the tradition that the stone rolled from the Castle Keep and that it was part of the ancient Keep (which it is known was in the form of a fetter-lock). It was accordingly decided by the Society that whilst the actual position of the stone should not be interfered with, that the mass itself should be lifted and the tooled stonework, if any, revealed. This was done, and the concrete mass was found to be simply the backing of a liberal breadth of worked Barnack ragstone forming a more or less obtuse angle with plinth complete. More than this; it fitted exactly into what can be imagined to be the design of the fetter-lock Castle Keep as it joined the southern bastion. The mass, weighing some twenty tons, was then raised to the same vertical position as it occupied in the original building of the time of Edward III., by the son of whom the Castle was rebuilt, so that the stone now tells its own story for the first time for 300 years or more.

ARCHITECTURAL ASSOCIATION EXHIBITION OF STUDENTS' WORK.

THE President (Mr. G. C. Horsley), in opening the proceedings on Friday, July 21, uttered a few well-chosen words, welcoming cordially the relatives and friends. He adverted to the criticisms sometimes offered as to the unsystematic wall-display of the students' sessional work. On the present occasion the method pursued had been to hang the work of the best students in the first and second years with a regard to completeness, thereafter hanging other work of these years with a view to displaying a large amount of variety. Some of the work of the third and fourth years' students was necessarily crowded out for lack of wall-space—at any rate from the standpoint of completeness of display. Mr. Horsley thought that the drawings exhibited spoke eloquently and well for the future. Masters and students all combined in the efforts towards success. To Mr. Maule the Council was deeply indebted, as well as to his able band of assistants. A change was foreshadowed in the immediate future whereby Professor Beresford Pite would act as Director of Education in co-operation with Mr. Maule, who would—at any rate for a twelvemonth—retain the control of the day school, whilst Professor Pite would assume the control of the third and fourth years' students. The Council desire to express their sense of the honour of having with them that afternoon Mr. W. R. Colton, A.R.A., and Sir Aston Webb, C.B., C.V.O., R.A. Mr. Frank Brangwyn, A.R.A., had also intended to be present, and the presence of these three gentlemen served to express the union of the arts which is at last the spirit and life of Art itself. Mr. Horsley proceeded to read out the list of prize-winners, premising that all cannot be first (though we must be permitted to disagree), and therefore the unsuccessful students should not feel discouraged, and their day for receiving reward will doubtless arrive.

Mr. Maule, who was warmly welcomed, said: Mr. President, ladies and gentlemen,—I feel it quite an ordeal to speak on occasions like the present, and I should have expected, too, that you would have been more or less uninterested in the work generally, though I confess I am pleased that you should show interest in architectural education. I will first of all refer to the arrangement for next year. When I asked the Council to relieve me of my post I expressed my willingness to continue for a twelvemonth if so desired. Professor Pite is therefore to take over the directorship, I continuing to control the day school for that period. Already several changes are foreshadowed for the benefit of the school. I always regard it as a great advantage that those who lecture should also teach; it is always difficult otherwise to obtain a sufficiently close connection between lectures and studio work. For the future the lecturing is mostly to be done by studio instructors. Professor Pite will himself take over the historical lecturing in the evening school. I regret that we shall lose some highly-prized lecturers—I refer to Messrs. Fyfe, Alan Potter and Prior, whose past efforts I value; but at the same time I welcome the new arrangement. Another change foreshadowed is, that the teaching of construction will be altogether in the hands of Mr. Varndell. I regard it as a great privilege to be associated with Professor Pite in teaching. The Architectural Association in general, and students and relatives in particular, should welcome the new arrangement and look forward with interest and excitement for the good results. Professor Pite is, to our regret, absent to-day, as he is lecturing in the North. I should like to reiterate my belief in the benefits that will accrue under the new arrangement. You all know Beresford Pite, what he is and what he does. Let me now refer to the work displayed on the walls, and I should like to point out that Mr. Dicksee is not our only first year student, as you might perhaps think from hearing the prize-list; others have run Mr. Dicksee very close. Mr. Gordon's work is excellent. In every year certain men come to the front and arrest the public gaze; sometimes they are really brilliant. On the other hand we have students who win to the front by steady, honest work, and they are, to my mind, specially commendable. The third and fourth years' work is very good, particularly that of Mr. Roberts, of the third year. The same remarks, regarding the calibre of students, apply to the fourth year. We have been criticised before now for not exhibiting all the sessional work; but it would be impossible, for we should need the whole of Tufton Street. No; we have to be satisfied with representing the best students thoroughly, and merely samples of the rest.

The test work of the end of the second year is done without any help in the course of five days. The student now finds what he is able to do under stress. The efforts of the staff lie in striving to get the student to make the most of himself, and teaching follows on. There is a want of character in youths of seventeen to nineteen years of age preventing them from doing their best. This is a defect of training. They cannot buckle to and work; it takes a couple of years to train them. Now this is a very serious fact, this loosening of the national fibre. Parents can help by making it easy for the student to work. His work is said to be hard; well, it *is* hard, but we must be ready to sacrifice pleasure for the sake of work; the study of architecture demands sacrifice. The evening school work is extremely hard, and if it has been so in the past it will not be less so in the future. The race is truly to him who will run with the greatest judgment. The indifference of Young England to the allied arts is, I consider, a defect of public school training. I thank you, ladies and gentlemen, for the patience with which you have listened to me.

Mr. Colton, A.R.A., asked to be excused from making any great mental effort on such a tropical afternoon. It would be useful to them perhaps to have the sculptor's point of view. He felt, in the first place, that we should alter our preconceived idea of what architecture should be—we should do away with walls and have open colonnades with the thermometer so raging. Mr. Colton regards Gothic architecture as being unsuited for theatres; and, again, he thinks Wren's smaller churches as unsuitable to the Christian religion. St. Paul's Cathedral, too, lacks a sense of awe, but it exhibits the value of mass and scale. In domestic architecture a depressing house is an obvious failure. Buildings have soul as well as body; to build a War Office like a theatre or an hotel is a failure—both the soul and the spirit of the building are missed. Suppose that a sculptor, in modelling a lion, gives it the body of a dog and the head of a chicken, the result is failure. Architects' drawings tend to be flashy; to make a nice, sloppy, loose drawing is a mistake, and works out lamentably. The foundations of architecture are mass, proportion, and unity.

Sir Aston Webb, C.B., R.A., remarked that he had really nothing to say, and anyway it was too hot. He had been looking at the drawings and he could not agree with Professor Colton as to the drawings being misleading (though this, indeed, was not what Mr. Colton had said). Drawing is necessary. Designing is difficult, and drawing is necessary to express the design. Nor is the style of drawing exaggerated at the present day. Those exhibited showed a minimum of unnecessary work. Architecture is the most difficult of the arts. Sir Aston Webb thought the year's work very satisfactory, and congratulated the masters.

The President thanked the speakers, and the proceedings then terminated.

LIST OF AWARDS AND PRIZES.

DAY SCHOOL.

First Year Awards.

Book prize for 1st place in history test paper and general excellence in this subject, H. J. H. Dicksee.

Book prize for 1st place in construction test paper and general excellence in this subject, H. J. H. Dicksee.

Geometry, 1st place, volume of Sketch Book, H. J. H. Dicksee.

Physics, 1st place, volume of Sketch Book, H. J. H. Dicksee; hon. mention, R. S. Wallace.

Freehand drawing, 1st place, volume of Sketch Book, E. C. Davies. The Studio prize—best portfolio of drawings made during session, H. J. H. Dicksee.

Hon. mention for progress during year, and authors of drawings selected for school portfolio, H. J. H. Dicksee, R. S. Wallace, E. C. Davies, H. G. Satchell, and E. Hayman.

Second Year Awards.

Travelling studentship, value £15, for studio and lecture work during session 1910-11, holiday work, and general progress, D. J. Gordon.

Specially commended, T. W. Dowsett and C. M. Cooper.

Hon. mention for general progress during session, G. Fildes and C. G. Ripley.

End of session test. Prize offered by the master, H. P. G. Maule. Subject: A village club and institute. Study placed first, D. J. Gordon; specially commended, Stanhope Bennett, T. W. Dowsett, and C. F. Aldous; honourably mentioned, H. Fellowes Prynne, C. M. Cooper, and Howard D. Archer.

Students recommended for the Association two years' course Certificate:—H. D. Archer, C. M. Cooper, D. Cruickshank, T. W. Dowsett, D. G. Gordon, E. J. T. Lutyens, A. B. Peermahomed, G. Moerdijk, C. G. Ripley, G. Fildes, and S. A. Bennett.

Subject for vacation work.—C. F. Aldous, M. Day, G. Detmold, W. Harkess, H. F. Prynne, and N. F. Woodroffe.

EVENING SCHOOL.

Preparatory Courses.

Scholarship, free pass to third year, value £15 15*s*., E. Kennedy Smith.

Book prize, value £2 2*s*., J. B. M. Walch.

Master's prize for hardest worker, J. A. Hale.

Hon. mention, G. M. Aylwin and L. G. A. Dubuis.

Third Year.

Scholarship, free pass to fourth year, value £15 15*s*., A. B. Ll. Roberts.

Book prize, value £2 2*s*., G. W. Stuart.

Master's prize for hardest worker, T. F. Ford.

Hon. mention, A. E. Maxwell, R. C. Stevenson, R. Van't Hoff, A. T. Hardman, F. B. Spooner, and J. McGregor.

Fourth Year.

Travelling studentship, value £15, H. V. C. Curtis.

Book prize, value £2 2*s*., F. A. Crouch.

Master's prize for hardest worker, F. A. Crouch.

Hon. mention, A. S. G. Butler, J. O. B. Hitch, B. P. Gaymer, and C. W. Rogers.

ARCHITECTURAL DRAWINGS AT UNIVERSITY COLLEGE, LONDON.

AN exhibition was opened on Friday, July 21, by Mr. Leonard Stokes, P.R.I.B.A., of drawings made by day students at University College of the present session who are taking a two or three years' certificate or degree course, and by students who are attending the evening course of design, the cost of which is defrayed by the Worshipful Company of Carpenters.

As regards the arrangement of the exhibition, Professor Simpson, in some introductory remarks, explained that the work of the day students started from the left-hand corner, continued up the outside of the screen and along the two sides of the side aisle. The drawings were arranged, as far as possible, in the order in which they were executed: commencing with the building construction exercises, simple exercises on the "Orders" and other elementary work, and proceeding to more advanced problems and to designs. On the left-hand side of the central aisle were grouped together the drawings submitted by Mr. E. Musmann, one of the degree students for Part I. of the B.A. degree (honours in architecture). They showed the standard that the College authorities hoped degree students will reach by the end of their third year, although he had doubts whether the same high degree would be attained for some years. Mr. Musmann's drawings were awarded the Donaldson Medal out of the fund controlled by the Royal Institute. On the other side of the central aisle were drawings of buildings measured by students, mostly during the last long vacation, and sketches by them. Down the outer aisle on the right, and on the outside of the screen, was the work of the evening students in the design class, for which Mr. Leonard Stokes and Mr. Ernest Newton acted as visitors; also some sketches made by evening students at South Kensington Museum.

Mr. Leonard Stokes, P.R.I.B.A., said it was a simple thing to declare the exhibition open, because it had been already opened. However, he would like to congratulate Professor Simpson on the excellent standard of the work. About that there could be no two opinions. Some of the work was particularly, perhaps extraordinarily, good. It was certainly a fine thing to have a lofty standard to aim at, and it was excellent for the students at University College to have had such a high standard set before them and to have high ideals. Unfortunately, ideals became lost as one grew older, and so the students should keep to theirs as long as they could. He did not like to particularise about the exhibition, which, as a whole, was full of interest. The college authorities were very wise in getting the best men they could to act as visitors. He could say that because he was one of them himself. But there was a danger in keeping too much to one man, as thereby the students were apt to get into ruts—even though those ruts might be excellent ones. In referring to the work done, he might say that the ladies' work struck him with amazement. As a mere man, he himself could never hope to do anything like it. Male students would have to be very careful or they would find themselves left hopelessly behind if the ladies go on as they are doing at present. It was proposed to introduce a higher course of architectural training at the College. The establishment of such a course would meet a long-felt want in London, where the higher branches were not taught to the extent they ought to be. There were provided, of course, already many opportunities for learning; but things like town planning were not treated on broad enough lines. The advanced course which the College was introducing seemed to be a most excellent one, and would be an interesting experiment. He advised the students to make up their minds to go in for it. There were, of course, a great many things to be learnt before they could tackle this big subject—though even a small cottage could be treated on big lines and in a broad and simple way. He hoped the students would get a great deal of benefit from it.

Dr. Gregory Foster, the Provost, said he had been asked by the College Committee to convey their thanks to Mr. Leonard Stokes. It was a great gratification to them that Mr. Stokes had consented to act as visitor again for another year, and they hoped to have him in that capacity for many years. Their Department of Architecture had received a new stimulus and new life with the coming of Professor Simpson. They hoped next year to institute a course of advanced academic design under the able guidance of Dr. J. J. Burnet. Indeed, they hoped to do a great deal more. Anyone who went to the house where the Architectural Department did its work would understand why they hoped to do a great deal more. They were in great need of additional accommodation. The building originally intended as the Bursar's house had been made to serve the purposes of the architectural students, though it was quite inadequate. The College authorities hoped to have a new building for the Department of Architecture. Some of them might have heard that the Senate of the University of London had been considering this matter for some years, and had come to the conclusion that the needs of London and the country generally with regard to architectural education would be better met by organising one strong school of architecture rather than by maintaining two relatively weak ones—one at University College and one at King's College. It was proposed, therefore, when funds were forthcoming for a larger building, to transfer the Department of Architecture which had hitherto been at King's College to University College, and house it in one building. That would mean that Professor Elsey Smith and his staff at King's College would join Professor Simpson and staff at University College. It would give them a strong staff, and he predicted success for the venture. He ventured to hope that the help of the Carpenters' Company would be continued. The scheme only needed some pious benefactor to bring it to a triumphant conclusion.

Mr. Percy Preston (Past Master of the Carpenters' Company), in seconding the motion, said he thought they ought to congratulate Professor Simpson very much upon the work the students had carried out under his instruction. They had to thank Mr. Leonard Stokes for coming there that day, and also for giving his time (as also Mr. Newton) in acting as visitors. The work shown reflected great credit on them, and on all those connected with the college.

We are asked to mention the exhibition will remain open until to-morrow—July 29.

ROYAL ARCHÆOLOGICAL INSTITUTE.

Tuesday, July 25.

THE Summer Meeting of the Royal Archæological Institute opened on Tuesday last with a reception in the City Hall by Alderman F. J. Beavan, on behalf of the Lord Mayor, who was detained elsewhere by his efforts to bring about a conciliation in the present labour disputes.

Alderman Beavan warmly welcomed the Institute to the city, and expressed a hope that the members would go back considerably benefited from the point of view of enjoyment and general interest.

Sir Edward Brabrook, C.B., Dir.S.A., Vice-president, acknowledged the welcome, and said they were delighted to meet in a city which had such very great archæological and modern interest. It was just thirty years since he had been in the town, and he would like to congratulate the city on the great improvements carried out, and especially on the possession of the beautiful building in which they then were. The Institute looked forward to their Summer Meeting at Cardiff.

An inspection was then made of the Corporation insignia and plate. The most conspicuous piece was the silver-gilt loving-cup presented in 1891 by the late Lord Bute at the conclusion of his mayoralty. It weighs 389 ozs. 5 dwts., and cost about £3,000. At the base are three enamelled figures on silver, representing the three local rivers—the Taff, the Ely, and the Rumney; on the cover is a fourth figure wearing a mural crown studded with diamonds, and emblematic of Cardiff. These figures were modelled by Mr. W. Birnie Rhind, of Edinburgh. Round the stem between the base and the stem is coiled the red dragon of Wales, the back of which is studded with rubies and carbuncles, and the claws with diamonds, while the eyes are emeralds. The whole cup is, in fact, encrusted with precious stones. Other good pieces are an epergne (1820), which was formerly the property of Charles X. of France when he was exiled and living at Holyrood Palace, and a very handsome and heavy jardinière or monteith (1786). The Corporation have four maces, dating probably from the period of Charles I. (1600-1649)—two are small and two are of a considerably larger size. Among the other objects displayed were the chains of the Lord Mayor and Lady Mayoress and some Coronation Plate (1902).

CARDIFF CASTLE.

The first visit in the afternoon was to Cardiff Castle. The grounds occupy the site of a Roman station, of which a considerable part of the wall and the north gateway remain. The quadrangular enclosure extends to about ten acres, and was defended by a high bank and a moat. At the departure of the Romans it was occupied by the Welsh princes of Morganwig. The castle was taken by Robert Fitzhamon about 1090. After many vicissitudes it came into the possession of the Crown, and was granted by Edward VI. to Henry, Earl of Pembroke. That nobleman's son did a great deal of building work, though of this there is nothing now remaining. Seven Earls of Pembroke held it in succession. It later passed into the possession of the family of Lord Mount Stuart. Through most of the eighteenth century it seems to have been uninhabited until about 1780, when they did a great deal to the building. This was followed by another blank, until, in 1870, the third Lord Bute took the work in hand, and employed William Burges.

Mr. John Ward, F.S.A., in describing the history of the castle, remarked that the early antiquaries appear to have known nothing about the Roman remains at Cardiff, for the first reference to it as a Roman station may be said to have been made in the early part of the eighteenth century by Baxter. It was not until 1760 that a writer recognised the site of Cardiff Castle as being that of a Roman castellum. The theories put forward by the early writers form one of the most amusing and interesting examples of archæological guesswork known. As a matter of fact, little or nothing was certain about the part played by Cardiff Castle in Roman history. The Normans cut a huge ditch to surround the Roman lines. The mound on which the keep stands was probably raised by the early Normans or the last of the Welsh lords. The whole area formed a very symmetrical castellum, closely resembling that at Porchester and of about the same size. The castle served as a sort of outlier of the Saxon coast forts. It was worth noting, said Mr. Ward, that the bastions are polygonal, and the sides are not truly at right-angles, as they bow outwards. The outer wall was mainly or entirely enclosed externally by a bank. The first stages of the castle might be thus described: first it was a castellum, and a very important one in late Roman times; then it had its uses as a ruined castellum. Next there was the Norman adaptation of it by throwing up a mound and altering the walls. It was difficult to say at what date the Romans first appeared on the scene. When twenty years ago the walls began to be uncovered, it was found that Roman work was placed upon still earlier Roman work. The object of the fort was to bar the Severn against the Irish and other pirates. The polygonal keep was the only example of a shell keep in Wales. The outer surface of the north wall was reconstructed twenty years ago. The junction with the Roman work at ground level is marked by two courses of red stone. The gatehouse, with its core of Roman masonry, which was rebuilt at the same time, is going to be taken down and reconstructed in a more satisfactory manner.

To the west of the Castle, and in the grounds, is the site of a Dominican Friary, of the history of which very little is certain. It was founded about 1250, and until its suppression it continued to be a very small and poor establishment. Portions of the church walls and of other parts were standing as recently as 1840, but in that year they were levelled to the ground, and the site turned into a lawn. The late Lord Bute, however, afterwards had the foundations followed up, and wherever they were traced their lines were marked by dwarf walls; where their outline was unmistakable yellow and black bricks were employed, and when there was a doubt about it red bricks were utilised. Some of the latter walls are, according to Mr. Ward, very conjectural indeed; but, as he remarked, it gives, in a general way, a clear idea of the plan of a Dominican Friary in the thirteenth century. Mr. W. H. St. John Hope, M.A., mentioned that he had been consulted at the time these walls were being erected, but he had then declined to express any definite opinion, as he was not present when the foundations were laid bare. The gentleman in charge honestly told him he knew nothing about monastic buildings. In many places the outline was, he thought, decidedly conjectural. There was a church with the broad nave usual with a preaching Order like the Black Friars; nor could there be much mistake about the square of the cloister, though whether the alleys were as wide as shown was doubtful. The general arrangement did not always comply with the normal contemporary arrangements—so far as there could be said to be any normal arrangement. The fountain in the centre of the cloister space, said Mr. Hope, most certainly could not have been there, for not a single mediæval cloister in this country was provided with a fountain. Whenever a water conduit was erected it served a different purpose. Other parts of the ground plan suggested a frater, a yard, a kitchen, and, possibly, a chapter house and an infirmary.

Before leaving the grounds a somewhat hurried tour was made of the residential part of the castle, which is so strongly assertive of the individuality of its architect, William Burges. It is impossible to admire everything he did there, though a great deal of it is both ingenious and beautiful. His inventiveness and his mediævalism seems in some cases to have swept aside his discretion and that restraint which is essential to the best work. Apparently he was given by Lord Bute *carte blanche* as to cost, and this resulted in both exquisite and gaudy work.

ST. JOHN'S CHURCH.

The ancient and only parish church of Cardiff was St. Mary's, and from it sprang St. John's. St. Mary's was situated immediately within the south gate, and near the bank of the River Taff. Evidently its proximity to the river was recognised to be dangerous long before 1607, when its undermined foundations collapsed. St. Mary's was in existence in Fitzhamon's time (1090-1105), and was probably then built. The first mention of St. John's, said Dr. C. T. Vachell, in his description of that building to the party, is contained in an undated charter given between 1173 and 1183 by the Bishop of Llandaff. St. John's was then a small chapel-of-ease belonging to St. Mary's. In 1473 it was determined to greatly enlarge it and virtually to convert it into the parish church. It at present consists of a chancel with side chapels, a nave with four aisles, and a beautiful western tower of the best Somerset type. The cost of this great work is believed to have been borne by Lady Anne Neville, daughter of Warwick, the King-maker. The most ancient portion of the existing building (and probably the only portion of the original church left remaining) is the south arcade of the chancel (1290-1310), which has never formed a part of or been bonded into the walls of the existing nave. The special objects of interest in the church mentioned by Dr. Vachell were: (1) A perfect rood turret with door and steps complete; (2) a Jacobean marble tomb in the Herbert Chapel; (3) some good painted glass—notably a window in the north-west corner of the nave, designed by Ford Madox Brown; and (4) a reredos to the high altar by Sir Goscombe John, R.A. About ten years ago the church was greatly enlarged by the addition of two side aisles. At the same time the unsightly galleries were removed and other work carried out at a cost of £23,000. The latest addition is an oak chancel screen, designed by Mr. Compton, which has just been put up.

From St. John's Church the party went to the site of the Austin Friary, which is almost opposite the Town Hall. The site was excavated in 1897, when the foundations of the church were discovered and their outline marked by the erection of low walling. The monastic buildings were converted after the suppression of monasteries into a house, which was for many years the seat of the Herberts.

At 4.30 P.M. tea was served by invitation of the Lord Mayor in the City Hall. This was followed by an inspection of some of the chief exhibits in the Welsh Museum of Natural History, Arts, and Antiquities, of which Mr. John Ward is the curator. Its unique feature is a collection of Welsh (Swansea and Nantgarw) porcelain, now very scarce, as the factories were of short duration. The Museum, it may be mentioned, will be transferred to the National Museum of Wales, which is to be erected in the Cathays Park on a site to the east of the City Hall.

At the evening meeting in the City Hall Mr. J. W. Willis Bund, M.A., LL.B., F.S.A., read a paper in place of the address which was to have been delivered by the Right Hon. the Earl of Plymouth, the President of the meeting, who was unable to leave London owing to the political crisis. Mr. Willis Bund dealt with

GLAMORGAN AND PEMBROKE.

It would be difficult, he said, to find any two places of greater historic interest in the Principality than those the Institute has chosen for its visit this year. The only possible objection that can be raised is that the programme is too ambitious. Still in a way the combination is a happy one, as it enables a comparison to be made of two great Norman colonising experiments and to study the modifications that the different circumstances the method met with produced both on the system and its results. It would, however, give an entirely wrong impression if the matter was considered solely in the light of the Norman Settlement; a consideration of the earlier history is necessary to realise the different conditions which prevailed in the two localities.

I. The first condition is common to both. As far back as history extends until it is lost in the dim light of Celtic legend the west coast of Wales and the shores of the Severn Sea were subject to frequent raids of pirates from Ireland, from Cornwall, from France, and from the North. These raiders are usually called Danes, but (if the line may be adapted) from whatever country they came Wales could say they were "All of them Danes in plundering me." The Welsh were not above having expeditions of their own, plunder and slaves were an attraction to them as to their plunderers. An account of one of their expeditions to Ireland has survived. A Welsh Prince Caroticus made an expedition to Ireland, and doubtless his followers considered themselves fortunate in finding a number of persons assembled for a baptism of native Irish who had been converted to Christianity. While still in their white baptismal robes the Welsh swooped down on them, killing some, carrying off others as slaves. It was a successful haul—so much so that St. Patrick, who heard of it, sent the next day asking if the Welsh would restore some of the plunder and the baptised captives; the Welsh only laughed at the Saint's request. Patrick's only weapon left was to resort to strong language, which he did, and wound up by asking: "Where will Caroticus be with his wicked rebels who distribute among their depraved followers baptised women and the spoils of orphans?"

In the Severn Sea these slave-hunting raids from abroad were frequent, but gradually, possibly from the influence of the Church, the Welsh raids appear to have decreased. But the piratical visits to Wales continued, or possibly it might be said the Welsh gained all the fruits of plundering "in a more excellent way," that is, by plundering the plunderers. If anyone looks from the hills above Cardiff out to the Severn Sea he may see two islands known as the Steep and the Flat Holmes: these became the abode of Saints of the greatest sanctity. Legends of considerable beauty exist as to these Saints and their deeds. The Saints were not confined to those on the Holmes. Most of the islands and rocks in the Severn Sea had its Saint, who were venerated for their piety and who died in the odour of sanctity. How did they pass their time on the lonely rocks? This they kept a profound secret—it was said to be in praying and meditating. Possibly this was not always so. Ships sailed up the Severn in safety, and ships were shipwrecked in descending. Saints inhabited the islands. Some of the raiders were so pleased with the shores of the Severn Sea that they remained there for life—among them one named Harding, whose descendants, the great house of Berkeley, have still an abiding place there. One point of importance should be remembered in connection with these raiders, we know little about them, we might and ought to know more. Many of them were buried by the shores of the Severn Sea. Whenever, either by opening a tumulus or in any other way, relics of the past, bones, pottery, weapons, are uncovered they should be religiously preserved. They may tend to throw light on the history of the raiders. Some of the pottery figured in *Archæologia* found in Glamorganshire is of an Irish, others of an unknown, type. It is from such specimens and the bones and weapons the history of these men has to be built up. How much of the history of these early raids has been lost?

II. Part of the raiding period, certainly so far as Glamorganshire, and possibly also Pembrokeshire, is concerned, was covered by the Roman occupation. The Great Roman Road, the Via Julia, ran along the coast lines of

Glamorganshire and Carmarthenshire, and connected with it are traces of Roman occupation. The Roman towns of Caerwent, Caerleon, and Caerdiff all mark points on the road, and the fact that these stations are nearer together than is the case on most of the Roman roads may be a testimony to the peril of their position and the fighting power of the Silures. As the road proceeds from Caerdiff westward traces of Roman occupation are still to be seen. Between Pyle and Neath a Roman miliary stone (now in the Swansea Museum) was found; said to bear the name of Victorinus. Two other miliary stones were found near Aberavon (Port Talbot). Still further along the road at Llougher, on the river of that name, where the road crosses into Carmarthen, traces of a Roman station were found, among them a Roman altar. While at Carmarthen a Roman stone and two small Roman altars have been found. Along the whole length of the Via Julia, from the Wye to the Touy, clear traces of Roman occupation exist. No inscribed Roman stones seem to have been found west of Carmarthen in the direction of Pembrokeshire. This points to the fact that there is not sufficient evidence to justify the opinion of the eighteenth century antiquaries that the Roman road went on from Carmarthen to St. David's.

III. Whatever vices the Roman soldiers possessed and brought with them to Britain it is fairly certain they brought over one great virtue, for it was to them that we are indebted for Christianity. Some spot along the Via Julia, most probably Caerleon, the headquarters of the II. Legion, the one that garrisoned the district, was the place where Christianity first made its appearance in Wales. Thence it spread probably along the line of the Road, which would account for the number of Christian schools that sprang up near it. All these early Celtic schools in Glamorganshire gradually disappeared as other influences arose. But not the least interesting among the many interesting points relating to the Welsh Church is to compare the histories of the two great South Wales monasteries, one at Llandaff and the other at St. David's. At the former will be seen a great religious establishment almost within bow-shot of the castle of the feudal lord, under his influence to a considerable extent; while at St. David's will be seen a great independent religious establishment, the feudal lord of which is the head of the monastery, and where it was his interest to maintain his feudal rights and not unnecessarily to interfere with the existing state of things.

It will not be necessary to go into the story of the two dioceses of Llandaff and St. David's, nor to show how the Llandaff Bishopric suffered from its proximity to England. It was almost impossible for it to have preserved its national independence, surrounded as it was by castles of Norman lords, each of whom wanted some part of the episcopal possession. That Llandaff was spoiled by the Norman settlers is abundantly proved by documentary evidence. St. David's retained her independence from various causes, not the least being her remoteness. When the Institute are going round the country they will observe how castle after castle is to be found in Glamorganshire, while when they reach St. David's they will see the great church alone in its desolation, and will begin to understand how differently the Church worked in the two districts, owing to the different character of the districts on which it had to work. It is true Urban at Llandaff kept up a steady contest with Bernard of St. David's, but the victory was a foregone conclusion. A protected prelate had no chance against a man who combined in himself the offices of feudal lord and Norman bishop.

IV. The conquest of Glamorganshire is a matter upon which much has been written, and upon which it is difficult to separate history and legend. Fitzhanon and his twelve knights—the number sounds as if legend had come in—is a very fascinating subject, but one that has to be passed by for the present. Assume for the moment he had twelve followers, and he gave them all grants of land and they all built castles, a certain number certainly did—the exact number is of little importance here. What is of importance in taking Fitzhanon as an average specimen of the Norman colonists is to see the way in which he carried out his work. Whatever else he was, he was a strong able man. Unless he had been he would never have received the lands that the Crown gave him. He combined the two qualities that all the prominent Normans appear to have possessed, great personal courage and great superstition. His courage was proved in many a fight, finishing at Tenchai, where he received severe wounds, from which he never recovered. His superstition or piety is proved by his gifts to various religious houses, but above all by that noble pile of which he was the founder, the Abbey Church of Tewkesbury, and in which he is buried. The great pillars of the nave may be taken as typical of the man and his work to crush out all resistance, both ecclesiastical and civil, to his rule. First came the castles, Cardiff, Caerphilly, Coity, and a number of others in Glamorganshire, and then, further along the old line of the Roman road, Loughor, Kidwelly, Llanstephan. This was the civil side, one of the pillars on which Norman rule was to rest; the other, the ecclesiastical side, of which the pillar was the Monastery. This was done in two ways: first, by making gifts to existing religious houses, either in England or on the Continent, mainly on the Continent. Between 1066 and 1100 six religious houses were founded in South Wales, all were Benedictine, four were cells to Norman Abbeys abroad, and of the two English one was a cell to the Conqueror's Abbey of Battle, the other to St. Peter's, Gloucester. In looking over a map of Glamorganshire it may be seen that along the Via Julia and the adjacent lands the Castle and the Abbey go hand in hand. Where there is a castle near to it is a religious house of some kind, usually a Benedictine house; thus showing the deliberate intent of the Norman settler to establish Norman rule both in matters ecclesiastical and civil, or, to use the words of a great writer on the Monastic system, "The Monastic Orders were but one branch of that great Christian Society ruled by the Church and feudalism." From the Wye to the Touy the country was governed by this combination, and although doubtless there was tyranny and violence, yet it was successful. The country became one of the most prosperous parts of Wales, and the term "preservation of life and property" had some real meaning. Considerable remains of this system are to be seen. At Ewenny there is a fortified priory which shows the system at work from one side, a priory which was a cell to St. Peter's, Gloucester, and was fortified to protect the Gloucester Abbey's possessions. At Cardiff there is the chapel in the castle, which was given to the Abbey of Tewkesbury. Thus both these houses secured the lives of their servants and the property of their houses if occasion arose. But they did not rest here. Such of the churches as have escaped the obliterating hand of the restorer show that these were mostly also fortified, at least sufficiently to enable the settlers to hold out until help should come from the castle. Many of the churches are large enough to hold all the inhabitants of the place and much of their property, including the sheep and cattle, which would give a supply of food; and although we might not care to drink from a churchyard well, yet in case of an attack the early inhabitants during a siege might not be so particular.

The line of castles continued either on the road or the approaches to the road until Carmarthen was reached; here they practically stopped, and this is further evidence that the road did not continue beyond Carmarthen. While some of the other approaches to the road are guarded by castles, each of the mouths of the rivers has its castle, as, of course, Neath, Swansea, Loughor, Kidwelly, and Llanstephan, so if the worst came to the worst there was an escape or relief by sea. The Welsh did not possess ships, they had been cut off from the seaboard.

The position may be thus summed up:—

(*a*) The piratical raiders had taught the lesson of the importance of the sea; that lesson had been learned, the sea was well guarded.

(*b*) The Romans, by making the great road, had taught the importance of keeping open a direct means of communication; that lesson had also been learnt and not forgotten.

(*c*) The Normans had felt the importance of having a body on whom they could rely for defence if his retainers were absent, that body were the monks, and so the castle and the convent were combined.

(*d*) The Norman system, applied and enforced by the castle and the convent, gradually got rid of the local customs and ideas, so that along the tract of country within the influence of the Norman a state of society was growing up which differed but little from that of England. Local customs, ideas, superstitions, and language prevailed, it is true, but there was no idea of a separate country or a separate nationality. What the Pale was to Ireland the settled part of Glamorgan was to Wales. So it may be said that, given the proper circumstances, the Norman system of colonising proved a success.

Turning to Pembrokeshire, we are met with a different state of things. Here there was no one who occupied such a position as Fitzhanon did in Glamorganshire, and the Norman influence was confined to particular defined parts. As in Glamorganshire, they were raiders, and the old legends point to rather an active intercourse between that district and Ireland, an intercourse which was continued after raiding had practically ceased. This intercourse tended to keep up the local and national customs by securing a constant immigration of Celts into the country, a state of things practically unknown in Glamorganshire.

Probably the fact that there was no real Roman occupation, even if the Romans ever reached the further side of Pembrokeshire, tended to foster native ideas. Had the Via Julia with a line of forts extended beyond Carmarthen a very different state of things would have arisen. As it was, West Carmarthenshire and Pembrokeshire were cut off, isolated, and thrown largely on their own resource. The Church had also an isolating influence, and was able to gain an authority and position that was quite exceptional. A large and powerful monastery, receiving constant grants of land in all the counties of South Wales, was in a very different position from a monastery which had all its lands around it and powerful neighbours always ready to plunder it. Up to the Norman Conquest the Monastery of St. David's had gained such a grip on South Wales that it would have been very difficult, even if possible, to relax it.

All the history of the district before the Conquest tended to consolidation, and this process had gone too far for the Normans to change by ordinary means. South Pembrokeshire, with the strong fortress of Pembroke, had been settled precisely as Fitzhanon had settled Glamorganshire—a castle with a religious house under its shelter. So also the castles of Carew and Manorbiers were built as some of the Glamorganshire castles, and this part of the country was gradually settled in the same way as Glamorganshire. But a new feature was introduced to a large extent, how large is a matter on which people differ; the Welsh inhabitants were cleared out, and a number of Flemings settled in the district. North Pembrokeshire—that is, the lordship of Kemmes—was settled by a Norman, Martin of Tours, but separating him from South Pembroke was the jurisdiction of the House of St. David's, the Hundred of Dewisland. So the Lord of Kemmes was to some extent isolated. South Pembrokeshire stood by itself, an expropriated county. The real power in the district was the St. David's House. As soon as St. David's House fell under the rule of a Norman bishop, and such an able bishop as Barnard, it might be thought that the Normanising of the country would go on. But it was not so. What time Barnard would give from his other duties to his diocese was mainly occupied in fighting the Bishop of Llandaff, Urban, as to the boundaries of their respective dioceses, whether certain churches dedicated to St. Teilo could really be the property of the St. David's House. The officials of the diocese were, it is believed, mainly Welshmen. As long as Welsh law and custom were carried out no difficulties arose. So while nominally the Bishop of St. David's was a Norman bishop assisting in the Norman settlement, in fact he was keeping things as they were. So much was this the case that even in the fourteenth century Welsh customs prevailed on some of the estates of the See.

For some reason the Normans did not introduce Benedictine monks into Pembrokeshire in anything like the same way they had done in Glamorganshire. About 1125 Robert Fitz Martin, then the Lord of Kemmes, founded a House of Reformed Benedictines at St. Dogmaels, on the Teifi, known as Tironian from the great House of the Order of the Abbey of Tiron. It prospered and sent out two cells, one at Till and the other on the Island of Caldey. Except Monkton, Pill, Caldey, and the Mother House St. Dogmaels, there were no other Benedictine foundations in Pembrokeshire. When this is compared with the number in Glamorganshire the difference between the two settlements will be realised.

It might be thought that the Norman colony in Pembrokeshire was a failure. This can hardly be said to be the case in the area to which it extended. The very drastic measure of clearing the country and establishing the Flemings made a success of what might have otherwise been a failure. Although the Normans in Cardiganshire, the Clares, were only separated by the river, yet the Lord of Kemmes never became the power that the other Lords Marchers were. Yet his descendants are the only survivors of the settlers who are still in possession of the lands and rights. It was the House of St. David that was the real power in the country, and in spite of all that happened it was the House that remained the great power.

Pembroke stands on a site pre-destined for a fortress. Carew as it now exists is a fortified house. As to Manorbier, it will perhaps be best to give its description in the words of one who was born there and to whom we owe so much for our knowledge of mediæval Welsh history, Giraldus:—"As Demetia," he says, "is the fairest of all the seven cantrefs of Wales, and Pembroke the fairest of Demetia, and this spot the fairest of all Pembroke, it follows that Manor Pyrr is the fairest spot in all Wales."

But St. David's is unique. Possibly the view of the place where the Welsh bishops dwelt in all their glory, even in its decay, will bring home more forcibly than anything else the power and authority of the See of St. David's. Its power and authority was to a great extent maintained by its great inaccessibility. "Roma dedit quantum bis dat Menevia tantum" can now hardly hold good. To say nothing about Welsh history, there is the important part that Pembrokeshire has played in English history. The last successful attempt to take forcible possession of the Crown of England started in Pembrokeshire. Two French invasions have been made from it, one to terminate at Worcester, the other, the last in our history, to terminate in the invaders surrendering to a man. One of the Pembrokeshire peers gained his earldom, not as peerages are proposed to be gained now, but for his action in that invasion. Coming nearer to our own times, Pembrokeshire was the headquarters of the last rebellion, that of Rebecca and her daughters.

ILLUSTRATIONS.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR.

The new buildings of the University College of North Wales occupy an extremely fine site in upper Bangor, overlooking the city, and presented to the University authorities by the Corporation.

The entire scheme comprises the following: (*a*) Administrative Council chamber, &c.; (*b*) arts department; (*c*) chemistry and physics; (*d*) botany and geology; (*e*) agriculture; (*f*) great hall; (*g*) library and museum.

The portions at present erected include sections (*a*), (*b*), (*f*), and (*g*), the science work being carried on in the Old College Buildings at some distance from the New College.

The buildings are arranged in the form of two quadrangles, the smaller of which is completed, but only a part of the larger quadrangle is built at present. The whole of the buildings are faced with Cefn stone, and the roofs covered with Precelly slates, all floors and staircases are of fireproof construction, and the joinery throughout is of wainscot fumigated and wax polished.

The heating is by low-pressure hot-water, and especial care has been given to the ventilation, which is on a somewhat novel principle. The lecture rooms have windows on both sides, and the corridors are entirely open, thus ensuring an ample and constant provision of fresh air.

The library is a fine apartment, 120 feet long, with an open roof decorated with the arms of the principal boroughs of Wales. The book cases are arranged in the usual manner of a college library, and storage is provided for over 100,000 volumes. The library and museum are the gift of the Drapers' Company.

The great Hall has been erected with funds generously provided by Sir John Prichard Jones, Bart., and is named after him the Prichard Jones Hall. It provides accommodation for over 1,000 persons.

It is hoped that it may be found possible to proceed at an early date with the Science blocks, and so centralise the work of the college.

The architect is Mr. Henry T. Hare, F.R.I.B.A., and the builders are Messrs. Thornton & Sons, of Liverpool.

Our series of illustrations of these buildings was commenced last week, and will be continued in subsequent issues.

The annual meeting of the Western District of the Institution of Municipal Engineers was held on the 15th inst. at Worcester, the chair being taken by Mr. Henry Hulse, borough surveyor and engineer, Droitwich. Mr. Henry Hulse, was elected district chairman, and Mr. John Brook district secretary, for the ensuing year. It was arranged that meetings should be held at Coventry, Evesham, and Gloucester during the next few months, the first to be held in September. A paper, "Municipal Engineering as a Profession," was read by Mr. B. Wyand, and a brief discussion followed, a vote of thanks to the author being proposed and seconded by Mr. H. Treadwell and Mr. W. Whitehouse respectively. Votes of thanks to the retiring officers, Messrs. Wm. Davies and H. J. Weaver, were passed and carried unanimously.

A MODERN SYSTEM OF PROTECTING BUILDINGS FROM LIGHTNING.

By Mr. Killingworth Hedges, M.I.C.E., Hon. Secretary of the Lightning Research Committee (1905 Report).

(Concluded from last week.)

EACH chimney stack should have one air terminal projecting at least one foot above the highest cowl or chimney pot; where economy is an object the conductor itself can have its strands opened out so as to form points, but it is better to furnish it with a solid copper point with three barbs firmly fixed. Rods of tube with the points only screwed into a ball are not satisfactory, as they soon deteriorate. Both the horizontal and vertical conductors should be kept away from the structure; even if the roof is covered with lead or zinc a space is required to prevent dirt accumulating. The down rods should be held by holdfasts at least 2½ in. from the walls.

Material for Conductors.—The use of iron instead of copper has been advocated from time to time since the days of Franklin, but it was left to Sir Oliver Lodge to demonstrate the advantages it possesses, and show that a conductor of moderately high resistance such as an iron wire would get rid of the store of energy contained in a flash in a slower and therefore quieter manner than the ordinary copper pipe or cable. A special make of iron cable which is coated with lead has been introduced, and should, if carefully jointed, last as long as copper.

Joints.—Rule 7, L.R.C., states that "Joints should be held together mechanically as well as connected electrically, and should be protected from the action of the air, especially in cities." It is hardly necessary to remark that if the plan described of using the metal work of the building—rain-water pipes and gutters—is employed, great care must be taken to see that there is electrical conductivity throughout the system. For the purpose of testing, a joint which can easily be disconnected should be inserted on each conductor leading to earth.

Earth Connection.—It is essential that the lower extremity of the conductor should be of copper, or suitably protected if of iron, and be buried in permanently damp soil; hence proximity to rain-water pipes and drainage pipes is desirable. The earth-plate should not be of less area than three square feet, and should be buried in permanently wet earth and surrounded with charcoal well packed round it. The conductor should be rivetted as well as soldered to the plate. Moisture is essential in order to obtain a moderately low electrical resistance; an earth which may test well at first may become almost useless if the soil in which the plate is buried is dry, so that it is often necessary to dig a very deep hole. In order to overcome this difficulty the tubular earth has been specially designed. It consists of a perforated steel spike driven tightly into damp ground and lengthened up to the surface by screwing on thick iron tubes, into which the conductor is dropped to the bottom and surrounded with granulated carbon; the top of the tube is fitted with a cast-iron piece containing a socket through which the cable is threaded and jointed with lead. A cap at the surface marks the position of the earth, and a watering-pipe fitted with a strainer is led to the nearest rain-water shoe, a small quantity of water being deviated to ensure the necessary moisture. "The resistance of a tubular earth on this plan should be very low and practically constant." (L.R.C.) A very good earth can be obtained by connecting to water mains if of cast-iron; gas pipes should be avoided. If there is a lake or stream in the neighbourhood it could be utilised, but to insert the conductor is not sufficient; it must be submerged for a considerable distance, and preferably forked into two or three branches.

Steel framed buildings are rarely damaged by lightning. The metal itself, if care is taken to see that it is suitably earthed in several places, forms an excellent conductor, but should be furnished with the usual amount of air terminals. This does not apply to ferro-concrete structures, as in many forms the metal ties are not continuous; a flash entering walls of this description would probably do much damage.

In conclusion, the question to be studied with regard to the protection of a building is that if it is worth doing at all it is worth doing thoroughly. With the exception of buildings such as churches with spires, or those with high towers where at least two down conductors should be fixed, the unit rod is of little value. The conductor on the highest point gives no security to other portions of the building; the stroke may disregard the spire of a church and fall on any portion of the nave. The question of expense then is not the erection of a rod or rods, but the amount of money to be spent on the entire system. Usually the question of the maintenance of a building is of sufficient importance that a certain sum is allowed for to keep it in repair, which would be increased by so little to keep a well-designed system of lightning conductors in order that the amount is hardly worth consideration, so that the only point to examine is the first cost.

As an object-lesson, the flash which struck the Royal Horticultural Society's Hall in Vincent Square last year may be quoted. Almost simultaneously with the clap of thunder the chimney stack on the outside wall received the full shock of a very powerful flash. The building has a system of conductors designed by the author which so far succeeded in dissipating the energy that the actual damage was confined to shaking off a few tiles from the top of the stack and the destruction of the pot, the air terminal being bent by the force of the impact, but not broken. Without this protection most probably the massive retaining wall would have either been split or much damaged.

THE ROYAL SANITARY INSTITUTE.

THE twenty-sixth annual Congress of the Royal Sanitary Institute is this week being held at Belfast under the presidency of the Right Hon. Lord Dunleath, D.L., J.P., who on Monday last delivered the inaugural address, in the course of which he said:—

The first words which I have the honour to address to you at this twenty-sixth Congress of the Royal Sanitary Institute must be to congratulate you on the selection of Belfast as your meeting-place; and I congratulate you with greater cordiality because I am an Ulster man, and a member of a family which, during the past century, has been intimately connected with this city, especially during the earlier stages of its growth and of its industrial development.

This city, as you know, is the largest in Ireland; it is also the commercial centre and metropolis of the most prosperous part of this island. On the present occasion, however, we are concerned more with the efficiency of its sanitary administration than with either its magnitude or its importance. In fact, I venture to think that our claim to the privilege of being chosen as the meeting-place for a great Congress of this character should rest upon the forward position this city has taken up on the path of sanitary progress.

Here you will find a prosperous community, with very few signs in their midst of extreme or widespread poverty. Unemployment, or insufficiency of employment, seldom threatens to become a serious social problem. In fact, if a low rate of pauperism may be accepted as a sufficient index of prosperity, we may consider ourselves as exceptionally fortunate; recent Local Government Board statistics have shown that Belfast has almost, if not quite, the lowest rate of pauperism amongst all the urban districts of the United Kingdom.

We claim, however, to be looked on not only as a progressive city generally, but as a city more especially progressive in the direction of sanitary improvement.

We have been fortunate enough for many years past to be governed by municipal authorities distinguished by their energy, their ability, and their public spirit. Some evidence of their labours is to be seen in a large and efficient system of city drainage (now approaching completion); in the acquisition of a plentiful supply of the purest water, from a remote range of mountains, to meet the requirements of a rapidly increasing population; in the erection of a splendid fever hospital; above all, in the demolition of numerous insanitary houses, and in the sweeping away of large areas of dark and narrow streets and alleys.

Moreover, an additional improvement scheme for the clearing and replanning of an extensive insanitary area has been sanctioned, and, at the present moment, is in the early stages of execution. This scheme provides for the taking up of 16½ acres of land, and for the demolition of 1,075 dwelling-houses and three school-houses.

Much, however, still remains to be done on these lines. The Sanitary Committee of the Council, in addition to what may perhaps be called their routine duties, will no doubt be fully occupied for many years to come with the promotion of further schemes of housing reform. Some of us, in fact, are sanguine enough to anticipate that in the course of the next few years every subsisting insanitary house will be demolished, and every subsisting insanitary area clean swept and replanned.

It is certainly most satisfactory to note that, following the sanitary reforms to which I have just referred, there has been during the last few years a corresponding decline in the mortality rate. Not only has the total death-rate fallen steadily year by year, but the death-rates from tuberculosis, and from each one of the principal infectious or zymotic diseases, have at the same time been substantially diminished.

The City Council are now enabled to assert with confidence that their past expenditure on sanitary improvement has been amply justified by results. Encouraged and stimulated by the victories already won, they will no doubt press forward with renewed zeal and devotion to further sanitary conquests.

His lordship then proceeded to give a sketch of the position of sanitation—or the want of it—fifty years ago, and to contrast that with the present state of affairs. He laid especial stress on the question of tuberculosis, and treated at length of the necessity for further endeavours in combating this scourge of humanity.

Dr. Louis C. Parkes lectured to the Congress on "The Prevention of Tuberculosis: a National Task."

In the section of Engineering and Architecture the presidential address was deliverel by Mr. W. Kaye Parry, M.Inst.C.E., F.R.I.B.A. (Fellow), who said:—

The present Congress of the Royal Sanitary Institute in Belfast recalls the meeting which was held in Dublin in 1884, and suggests a review of the period which has elapsed since the former gathering, in order to see how far the country has advanced in questions bearing upon the *Salus generis humani*, the well-known motto of the Institute.

On the former occasion a paper was read by Dr. Edgar Flinn on "The administration of the Public Health Act in Ireland with regard to the duties of Medical Officers of Health."

This paper is not cheerful reading. The author deplores the apathy of the authorities and the inaction of the Local Government Board. He states that the working of the Public Health Act in a great majority of districts has become well-nigh a dead letter, and he asserts that the dwellings of the poor are a fruitful source of disseminating disease.

After alluding to the prevalence of fever in all its forms, he asks: "Where does the fault lie? Are the people responsible for the filth amid which they live?" "If," he asks, "there be a Public Health Act in force, why are its provisions not strictly and properly carried out?" He proceeds to point out that the duties of a sanitary officer in Ireland are of no ordinary character. On the one side he "has an unwilling sanitary authority opposed to all measures of health reform, bitterly hostile to any sewage, water, or other scheme that may involve an expenditure from their incomes; and on the other side a disinclination on the part of the people to submit to sanitary legislation and accustom themselves to habits of cleanliness."

Could such a description be said to faithfully represent the state of things which obtains in Ireland to-day. Surely all must realise that a great change has taken place during the last quarter of a century, and it is a subject for congratulation that although in the matter of public health administration we are not what we ought to be, and we are not what we hope to be, yet we may thankfully add we are not what we were.

The passing of the Local Government (Ireland) Act in 1898 constitutes a notable landmark in the history of public health administration. Prior to that date the powers possessed by local authorities, especially in rural districts, were very restricted. The system of grand juries and boards of guardians, which worked fairly well as regards the maintenance of the roads and the care of the paupers, offered no facilities and gave few opportunities for effective public health administration, so that outside the urban districts little could be done, either as regards drainage, water supply, the erection of labourers' dwellings, or other works of sanitary reform.

After the passing of the Act the rural district councils were enabled to undertake many works which were sadly needed, and which could never have been attempted under the old system.

Grave doubts were expressed as to the wisdom of entrusting to these councils the extended powers which were then conferred upon them, and it was feared that the Local Government Board would find it impossible to control their actions and to induce them to make a proper use of their opportunities.

There were many people who were sceptical as to the ability of our fellow countrymen to rise to the occasion, and to unite for the purpose of putting into operation the provisions of the Act.

Doubtless very many mistakes were made at first. This could hardly be otherwise, and the patience of the officials of the Local Government Board must have been sorely tried. It is probable that there are still men who will assert that the local authorities have not made a good use of their opportunities. From time to time angry scenes are recorded in the newspapers as having occurred at council meetings, and excited councillors have threatened to defy, and in some cases have succeeded in paralysing, the action of the controlling authority. But an impartial and honest observer can hardly fail to admit that, having regard to their lack of experience, and their warm, impulsive natures, Irish district councillors have on the whole shown an unexpected aptitude for local government.

What they may lack in the cool judgment and steady, plodding perseverance of the average Englishman is compensated for by their superior intelligence and ready appreciation of the advantages derivable from modern sanitary reform. Those who are brought into contact with the members of these local boards cannot fail to be struck with the grasp which they often display of some of the complicated details of works of engineering, and the keenness which they show in studying and criticising the schemes which are brought before them by their professional advisers. The Englishman who fancies that the Irish farmers and shopkeepers are his intellectual inferiors will suffer a rude awakening when he is brought to book by one of the representative members of a small rural district council.

What, then, is the record of the public health work which has been done under the Local Government Act? There are many ways of making a comparison between the condition of Ireland as regards what Sir John Simon calls "modern sanitary institutions" in the year 1900, immediately after the passing of the Act, and the year 1910. Perhaps one of the most reliable methods of instituting such an inquiry is to compare the annual reports of the Local Government Board in Ireland for the two years just mentioned.

The report for the year 1900 gives an excellent account of the establishment of the new machinery for local government, and it also furnishes valuable statistics which can be placed beside the corresponding figure for 1910 with a view to ascertaining whether the decennial period gives indications of progress and improvement.

Perhaps the disease which gives the best indication of improved sanitation during the period under review is enteric fever, and from the same report it will be seen that whereas in the year 1900 there were 1,038 notifications and 99 deaths, in the year 1909 there were only 418 notifications and 51 deaths. In order to ascertain the improvement in the health of Belfast County Borough it is necessary to go back a little further. It will be gratifying to the citizens in this great and growing centre to find that whereas in the period between 1889 and 1893 the average death-rate was 26.6 per 1,000, in the period between 1904 and 1908 the average death-rate was reduced to 20.3 per 1,000; whilst in the case of the principal epidemic diseases, whereas the rate during the former period was 4 per 1,000, the corresponding rate for the latter period had sunk to 2.1 per 1,000. This is a very striking reduction, affording excellent evidence of improved sanitary administration in the city in which this Congress is being held.

The report of 1910 contains some observations also as to the working of the Public Health Acts in the country at large. The figures for 1909, we are told, exhibit some hopeful features, as the general death-rate for the towns has fallen for the first time on record below 20 per 1,000, the death-rate from the principal epidemic diseases is represented by the very moderate figure of 1.4 per 1,000, and the mortality from tuberculosis has undergone a substantial decrease.

Belfast County Borough furnishes some valuable statistics as regards the reduction in the number of notifications of enteric fever and simple continued fever within the period under review, for whereas in 1904-1905 the total number of notifications of cases of these diseases amounted to 1,065, during the years 1909-1910 the number had decreased to 133, and with the exception of the years 1905-1906 the figures show a steady and a most encouraging reduction.

The cases of fever, other than scarlet fever, which were treated in the dispensary districts in Ireland in the year 1903 were 2,619, whereas in the year 1910 the corresponding figure was only 1,041. There has been, indeed, a very remarkable falling-off in the number of fever cases in Ireland since the passing of the Public Health Act in 1878, when nearly 11,000 such cases were reported, the figures for the year 1910 being the lowest on record.

The administration of the Dairy, Cowsheds, and Milkshops Order of 1908 has already had a beneficial effect. An improvement is noticeable in the conditions affecting the public milk supply, the great majority of the urban districts having appointed verterinary surgeons to administer the order, and at the date of the 1910 report it is recorded that 216 out of 308 sanitary districts had taken the necessary steps to control the milk supply, and 6,651 persons had been registered as carrying on the trades of cowkeepers, dairymen, or purveyors of milk.

Smallpox is also one of the diseases which has been most successfully grappled with, for during the year 1910 the country was entirely free from this disease.

On the other hand, the large number of cases of those diseases which are scheduled under the Notification of Infectious Diseases Act of 1889, which have still to be dealt with, is indicated by the tables which show that in the year 1910 the total number of cases so notified in the urban and rural districts in Ireland amounted to 8,406.

Many of the figures which have been quoted may perhaps be regarded as having only an indirect bearing on the relation between the work of the engineer and the improvement in the health of the population, but the statistics of loans for schemes of sewerage, water supply, and similar works may fairly be claimed as affording direct evidence of the improved conditions of the country, due to the labours of members of the engineering profession.

Typhus fever has not been eradicated with as much thoroughness in Ireland as smallpox, as the notifications in 1910 number 182, as compared with 162 in the previous year, but the increase is more than accounted for by a local outbreak in Belmullet Rural District, where we are informed its appearance was associated with gross insanitary conditions, domestic overcrowding, and the keeping of animals in dwelling-houses. It may reasonably be anticipated that in the near future typhus will be banished from our island when the plague spots have been subjected to drastic reform, and the people have learned to appreciate the inestimable benefits of personal hygiene.

The loans granted to county councils are mainly in respect of the maintenance of the lunatic asylums, and in the main roads. At the present time the outlay on asylums is much less than it was some years ago. Not, alas! because insanity is on the decrease, for such is not the case, but rather because the country is reaping the benefit of the large sums of money which were expended by the Board of Control of Lunatic Asylums during the existence of that body.

Attention should be directed to the provisions of the Act of 1898, under which the Local Government Board continue to pay to urban and rural district councils certain sums in respect of the sanitary salaries paid by those bodies. It would seem that owing to these State contributions the Local Government Board exercise some control over the salaries paid to sanitary sub-officers.

In Ireland these salaries are very small, and as a direct consequence the sanitary sub-officer is not as highly trained nor as well qualified as might be desired. It would be a material benefit to the health of the people if these positions were made more lucrative, in order to secure the services of officials of the same class as the English sanitary inspectors, very many of whom hold the certificates of the Royal Sanitary Institute. If the Irish members were to take this matter up in earnest, there can be no doubt but that a more liberal contribution could be obtained from the Imperial Exchequer; and if such were the case an appeal could be made to the sanitary authorities to make a proportionate increase in the salaries of their staffs.

Public opinion as regards health questions is not nearly so advanced in Ireland as in England, and one obvious way of improving the sanitary condition of the people is to raise the status of the sanitary officers.

The comparatively lax administration of the Public Health (Ireland) Act of 1878 is doubtless partly attributable to the difference between this Act and the corresponding English Act of 1875, as regards the appointment of medical men and inspectors.

Under clause 189 of the English Act sanitary authorities are empowered to appoint "fit and proper persons" to be medical officers of health and inspectors of nuisances, and the words quoted suggest that those appointed should be qualified for their positions.

Under clause 11 of the Irish Act every doctor of a dispensary district is made *ipso facto* the medical officer of health for the said district; and, without desiring to cast reections on the officers so created, it is notorious that many of them are still both wholly ignorant of, or else entirely indifferent to, their duties. Sometimes only a beggarly pittance of a few pounds a year is grudgingly paid to them, and then they would be more than human if they exerted themselves zealously to enforce the provisions of the Sanitary Acts, even when they are familiar with them, as many of the chief offenders are frequently their private patients.

In Ireland also the so-called executive sanitary officer is usually the clerk to the local authority, and has often no practical knowledge of the administration of the various Health Acts, and the sanitary sub-officers are not infrequently conspicuous only by their sublime indifference to the elementary principles of sanitary science, their apathy and ignorance of the rudimentary laws of health, and their neglect of the duties which they are supposed to perform. Nor can any better men be expected to accept these posts until their superior officers are trained and qualified medical men holding some recognised diploma in public health, and until these medical officers are properly paid for their services.

Having regard to the inherent defects in the selection and organisation of the health officials under the Act of 1878, it is remarkable that in the absence of a perfectly-trained staff, and in the face of insufficiently-educated public opinion, such substantial progress as that which is supplied by the figures which have been quoted has been made. Much of the credit is doubtless due to the Local Government Board and its medical and engineering inspectors, who may be said to constitute an intelligence as well as an administrative department.

Did time permit, some reference to the improved housing of the artisan and labouring classes which has resulted from the operations of the various Acts relating to this question would prove interesting, but it is only possible to point out that the benefits which have accrued to the country from the Labourers' Dwellings Act are perhaps greater than might at first appear. Not only are the cottages which have been erected under this Act calculated to improve the health and comfort of the class by which they are tenanted, but the presence of these houses is sure to have a stimulating effect upon the welfare of the nation, and has probably assisted in reducing the losses resulting from emigration. As soon as our young men and women find that not only can they obtain employment in the country, but that they can also secure a comfortable home at a rent which is in proportion to their earnings, it is to be hoped and anticipated that many of those who would otherwise have left our shores may see their way to spend their time at home and do their share in building up a healthy, contented, and prosperous nation.

CALCULATIONS FOR RETAINING WALLS.

(Continued from last week.)

7.—*The Strength of a Joint.*

THERE is another factor besides its own weight which will assist the wall to resist the overturning effect of the wind, and this is the strength of the joints. If this factor did not assist it would be wiser to build the wall "dry" as it would be heavier.

In fig. 3, assuming that the wall would be overturned as shown by dotted lines, the joint AB would open, the brickwork below the joint remaining at AB, that above the joint lifting up as AD. The two bricks D and B, being cemented together, will require some force to pull them apart, and this will depend upon the adhesion of the mortar.

The adhesion of some mortars is very small and negligible, but others have a strength which is certainly worth taking into account. (*See* Table III.)

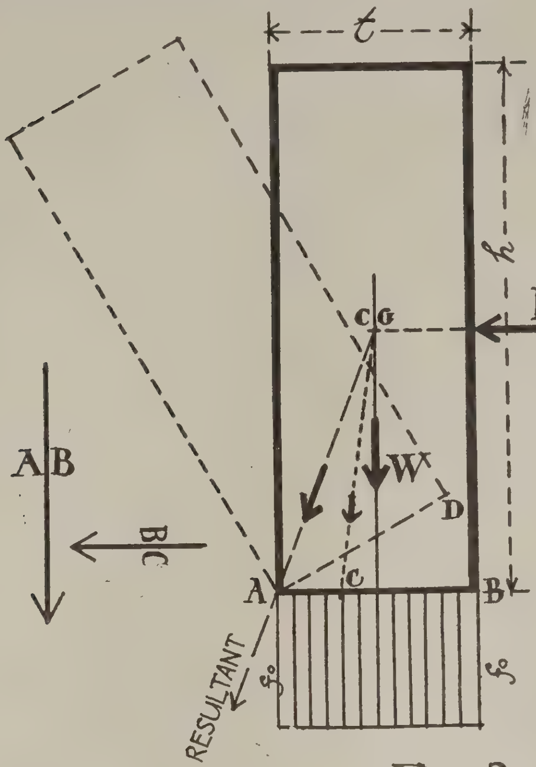

FIG. 3

The force moving D from B being a "pull" is called "tension," and is the opposite of compression.

It will occur later that at some point a joint has a "negative compression" upon it, which means, of course, a tension, such as between D and B.

Table III.

Safe adhesive strength of Mortar Joints.

Materials.	After Twelve Months.		Values Adopted in General Practice. Tons per Square Foot.
	Pounds per Square Inch.	Tons per Square Foot.	
Common brick in grey lime mortar .	7	0.45	0.25
,, ,, lias lime mortar .	14	0.90	0.75
Blue ,, ,, ,, .	24	1.54	
Ashlar masonry in ,, ,, .	24	1.54	
Hard stocks or ashlar masonry in cement mortar (1 to 3) . . .	30	1.93	1.00
Do. in neat cement mortar . .	60	3.85	

8.—*The Effect of the Wind-pressure.*

If the wind is strong enough it will blow the wall over in the manner indicated by dotted lines on fig. 3, and the wall will overturn about A. The point A, if the material does not crush, will act like a hinge. Let us consider the forces acting about A. We have the force W, tending to turn A in a clockwise direction—producing a "moment about A" (*i.e.*, in the direction of the hands of a clock)—and we have the force P producing a moment in the opposite direction.

Referring to our windlass in fig. 2. If we have a sailorman, called W, pushing as indicated by the arrow at G, and another, called P, pushing in the opposite direction at F, the two will hinder each other from turning the windlass.

The turning capacity or "moment of P" is P × CF, and if W is W × CG, and the windlass will turn in the direction of the greatest moment, the actual value of the resulting moment being the difference between P × CF and W × CG.

We call the direction of P × CF positive "+," and the direction of W × CG negative "—"; then the "resultant" moment or the "moment of the resultant" is the algebraical sum of + (P × CF) and — (W × CG).

9.—*The Stability of the Wall.*

From this last it will be seen that if the wind blows the wall over it means that the moment of P (fig. 3) about the hinge A is greater than the moment of W about A, and in order to produce stability, and nothing more, these two moments must be equal:—

$$P \times \frac{h}{2} = W \times \frac{t}{2}$$

where h is the height and t the thickness of the wall.

The condition thus produced is known as one of "unstable equilibrium."

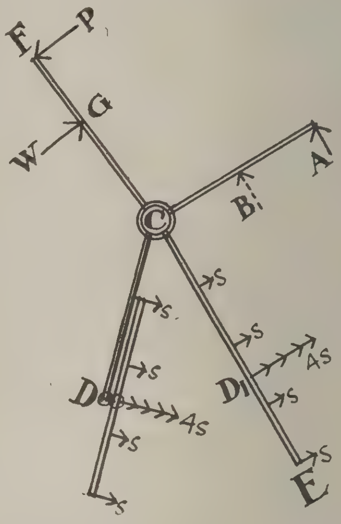

FIG 2.

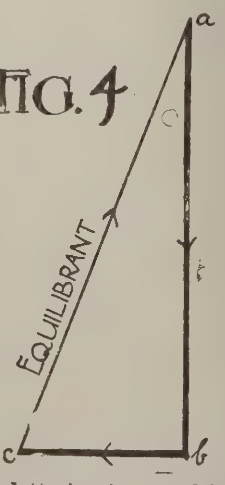
Now if the forces P and W produce no moment about A (their moments being equal and opposite) they must have affected each other in such a manner as to alter their directions until they actually pass through A.

It will be evident upon examination that any force not passing through A must produce a moment about A. Therefore the combined effect of P and W is a force through A called their resultant, and as both P and W are taken as acting through CG the resultant force must be one passing through A and CG. (The "resultant" of any number of forces is the name given to one force which may be used in place of the others.

10.—*The Triangle of Forces.*

This reasoning may be proved graphically by what is called the triangle of forces. In fig. 4 we have drawn a vertical force and put a letter on each side of it. As this force is acting downwards, or as it is applied at some point below the letters, its name is AB; if it had been acting upwards or applied at some point above the letters its name would have been BA.

FIG. 4



Notice that the lettering is named in a clockwise direction about the point of application of the force.

AB, then, will represent W, and BC will represent P.

Now draw a vertical line ab to scale, representing by its length the magnitude of W. Small letters are used, and their order gives us the direction of the force.

Following this direction we arrive at b and draw bc parallel to BC, and of magnitude P to the same scale as ab.

Take care that P and W are expressed in the same units (tons, cwts., lbs., &c.).

If the "closing line" *ca* be now drawn, a triangle will be obtained whose shape cannot be altered, which is complete in itself and has no effect upon anything outside of it.

The force necessary to produce this effect is *ca*, and is called the "equilibrating force"—*i.e.*, the force which is necessary to obtain "equilibrium" or "rest."

As *ca* will withstand W and P it must be equal to, but opposite in direction to the resultant which would represent these two forces.

The resultant of W and P is therefore *ac* in magnitude and direction, and its point of application will be the intersection of W and P.

If this force be now transferred to fig. 3 and drawn from CG, it should pass through A in order to have no moment about A. If this is so we have arrived at the same result graphically as mathematically in paragraph 9.

(To be continued.)

MODERN ELECTRIC WIRING PRACTICE.

(Concluded from last week.)

With regard to the new Institution of Electrical Engineers' Wiring Rules, the alterations of most general interest were contained in the table of carrying capacity of cables—the new values having been determined by experiment under working conditions, and set out in relation to length of conductor and unit pressure drop. Although these new limits were only about 60 per cent. of the values allowed by the Verband Deutscher Elektrotechniker, they represented a great practical advance, and should reduce wiring costs, whilst allowing a good factor of safety against increase in loading, which might take place after an installation has been put into service.

The speaker expressed the hope that discussion upon some of the points which he had raised might assist in standardising the practice of wiring in small premises, and help to evolve a specification which will enable builders and property owners to put in electric light wiring with the same confidence that they now have in ordering the standard work of the plumber and gasfitter.

The following criticisms of the Institution of Electrical Engineers' new wiring rules had also been prepared by Mr. Beauchamp.

No. 18. *Light and Heat.*—Separate main fuses to be provided for light and heat or power circuits. This is general practice, but many old installations do not comply and should be altered, as the growth of heating circuits will leave the lighting wires insufficiently protected where a common fuse is in use.

No. 23. *Lighting Sub-circuits.*—5 amp. limit increased to 6 up to 125 volts. 3 amp. limit maintained from 125 to 250 volts. These limits are possibly ample for all ordinary purposes in view of the increased lighting value of the watt resulting from the use of metal lamps.

Small Heating Sub-circuits.—15 amp. limit to 125 volts, 10 amp. limit to 250 volts. These limits appear to be insufficient in view of the increase in cooking; possibly the regulation was originally intended for radiators only, but, in its present wording, it is too indefinite to act upon, and it would appear that a regulation is required forbidding the use of switches on the body of any heater or on the flexible cord leading to it, otherwise the presence of a switch with the wall plug is very little protection, as the one which is the easiest of access will, in most cases, be the only one used.

No. 25.—Is an amendment of the old Rule 23 and is apparently designed to permit the use of wiring of the "Stannos" class, in which it has been shown that the inductive drop in the metallic sheathing is so small as to be negligible for all ordinary purposes.

No. 27.—Provides for earthing wires of not less than 14 S.W.G., and not less than 1 to each 50 amps. or part of 50 amps. normal working current, and furthermore that the earth wires should be protected against mechanical injury—an important provision—but one which is somewhat difficult to comply with, unless they are run in conduit. As has already been pointed out in this Paper, the weakness of all earth wires lies in the fact that loss of continuity does not interfere with the working of the installation, and that a long length of bare copper wire—which is frequently required to reach suitable earthing points—is very apt to become damaged by subsequent operations on the building.

No. 29.—The enclosure of Nernst lamps and holders within air-tight glass vessels has been the general practice in positions where gas and dust might give rise to danger, but experience with the metallic lamp has shown that its life is considerably shortened by enclosure in air-tight vessels, presumably as a result of the higher temperature at which the lamp is maintained, and there appears to be room for a fitting in which wire gauze or some similar substance plays a part in allowing a cooling ventilation and yet making it impossible for dust and gas to take fire as a result of lamp breakage.

No. 31.—Provides for fittings and tubing to be so arranged in bath rooms that personal contact with them is impossible. This regulation should be insisted upon and can generally be carried out with little difficulty—even in small rooms—if porcelain switches are used. It becomes the more necessary as insistence upon switches being placed upon the live wire is now becoming general.

No. 33.—The permissible drop in pressure remains at 2 per cent. with the addition of a standing figure of one volt, and in the case of power and heating wires is limited by temperature rise in cables, which should not exceed 20° Fahr.

No. 40.—Reduces the testing pressure for insulated conductors from 2,000 to 1,000 volts, and presumably will cover many classes of cable which have been in general use for a long time.

No. 43.—Applying also to cable, dispenses with braiding where conduit or tubing with a polished inner surface is employed, meaning presumably enamelled steel conduit.

No. 45. *Flexibles.*—The stringency of the test on flexible cords is maintained. An addition might be made here with advantage to the effect that fittings exceeding a certain weight including lamps and shades be separately supported by a wire or chain other than the conducting cord.

No. 49*a*.—Providing for conduit to be earthed and metallically continuous throughout. This regulation also states that slip socket conduit does not comply—some form of screw or grip fitting being necessary, and such fitting to be put on in a manner to secure the conductivity of the joint being equal to that of the tubing. This regulation is far-reaching, and apparently puts the great majority of conduit installations beyond the pale of the Institution Rules—a somewhat serious matter; in the writer's opinion it is both undesirable and impossible to bar good quality slip pocket conduit and fittings for general house and shop work; admittedly, unless they are metallically continuous, the earthing regulation constitutes more danger than safeguard, although experience demonstrates that the danger is extremely small.

No. 49.—In 49*d* it is provided that in dry places, isolated single lengths of conduit need not be earthed if adequately enamelled or insulated outside. This is brought forward from the old regulations and presumably has in view short pieces of conduit used for switch runs and similar purposes, but it is worthy of consideration whether for the great majority of house work, conduit should not be used with definite and intentional insulation between each length; this could be provided without increasing cost by the use of sockets made of insulating material or steel-lined with some insulator; it would then be only necessary to earth lengths of conduit within reach and situated in places which might, at times, become damp—such as basement sculleries.

It appears obvious that supply engineers have to take a definite position with regard to conduit wiring. By insisting upon screwed work, price is raised to a point at which a certain class of business may be lost. By permitting slip socket systems to be put in and earthed in the usual manner the protection obtained is illusory, although danger is proved by statistics to be minute, and the new regulations are not complied with.

No. 52.—Allows the use of flexibles for sub-circuit wiring excepting in factories, workshops, warehouses, and public resorts, provided that they are:—

- Within sight.
- Protected from injury.
- Carried through walls in water-tight and incombustible tubes.
- Not carried through floors and protected where within 4 feet of floors.
- Firmly supported on insulators not more than 3 feet apart.

COMPETITION DESIGN FOR KURHAUS BUILDING, CARLSBAD.—By Professor Emanuel Von Seidl, Architect.

Jointed mechanically in suitable boxes and fittings.

Nos. 58 & 59.—Allow concentric systems with the outer conductor uninsulated and earthed, such sheath conductor to be of a metal not readily corrodible.

Such systems being only permissible

Where separated from the supply network by double wound transformers.

On private plants.

Or where local earthing of the network on consumers' premises has been sanctioned by the Board of Trade.

(The latter method of working is on trial at present and results will be of considerable interest.)

Earthed concentric systems to be furnished with S.P. switches only.

To be completely concentric throughout up to fittings outlets.

To be earthed at service connection.

The outer sheath to be brought well into fittings, so that it lies between surface on which the fittings are mounted and the inner conductor.

Fuseboards to be S.P. with outer conductors bunched and connected to the case when metal, otherwise to be connected to a sheet of metal of full size at the back of the fuseboard.

Metalwork of fittings to be connected to the outer conductor.

Potential drop in the outer conductor from the earthing point to the farthest lamp not to exceed 7 volts at normal full load current.

It would appear necessary on systems of any magnitude to ensure that the outer conductors shall not make contact with low resistance earth connections other than the one provided at the source of supply.

Mr. S. E. Fedden (Chief Electrical Engineer, Sheffield) said that even with gas as cheap as it was at Sheffield there was no difficulty in having electric light adopted in houses of a rental of £30 per annum, provided they had not already been piped for gas, if they could only get the builders to wire when erecting the houses. He had hopes they would get the £20 houses also. Although not an advocate of jerry work, he thought that some of the ideals of the regulations would have to be dropped in the future if the small houses were to be got at. The wiring of small houses could be reduced from 8*s.* to 12*s.* to 4*s.* or 5*s.* per point by using slip tubing up inside the plaster of the walls, and wiring under the floors by boring the joists. The work in the joists was absolutely safe if the wires were placed far enough apart, and they need not worry about amperes per square inch. For many years he had indulged in the extravagance of 70/40 vulcanised flexible, as when he first went to Sheffield there was much trouble with flexible wires. But having got back the confidence of the consumer he was now rather inclined to drop this expensive flexible, and to go back to the cheaper one permitted by the Institution Rules. He did not think the question of earthing needed considering except in wet places, when he preferred screwed conduit connected to a good earth. He had known cases, however, where the use of voltage reducing transformers had increased the consumption instead of reducing it, owing to the enormous magnetising current losses. He thought the price of "Stannos" wire too high; he was sure that the manufacturers could afford to reduce it by about one half. He gave the following particulars of an estimate for a definite job as showing how "Stannos" wire came out. Wood casing with 600 megohm cable, £35. "I.M.E.A." flexible was £35. "Simplex" steel-armoured flexible, £41 10*s.* "Stannos" concentric, with double-wound transformers and earthed outer, £42 10*s.*

Mr. F. M. Long (Chief Electrical Engineer, Norwich) said that fourteen years ago they started the free wiring of small houses in Norwich, and it had been entirely satisfactory. The larger portion of their 5,000 consumers were now wired in this way. Many houses of £16 and £10 yearly rental were dealt with. Nearly all the troubles with wiring were electrolytic, and were not caused by over-loading; con-

COMPETITION DESIGN FOR KURHAUS BUILDING, CARLSBAD.—By Professor Emanuel Von Seidl, Architect.

quently they had to differentiate between work intended r damp places and that to be used in dry places. In dinary private houses much cheaper material could be used, nd the wires were attached to the joists between the floors. ith new houses that were being built, they tried to fix bes on the walls for the switch wires before the plastering as done, but he had not found the close joint tube satisfctory for this work, as trouble arose from the moisture in e plaster. It was more satisfactory to use solid tube. ith work of this sort, earthing was not at all necessary. e had found pure rubber insulation, double jacketed, the ost suitable for flexible; it was less trouble and cheaper an vulcanised.

Mr. W. A. Vignoles (Chief Electrical Engineer, rimsby) pointed out that the question of wiring on easy rms was an important matter, and might be discussed in nnection with cheaper wiring. It seemed to him very cessary for every town in the kingdom to have wiring wers, and notwithstanding the failure of the conference th the contractors, he hoped the Council were bearing the atter in mind, and that steps would be taken to promote a ll in the future. He did not think there was such a thing a good slip-joint conduit system. Every one was utterly d, and ought not to be used under any pretence whatever. ke Mr. Long, he had also largely used wires threaded rough the joists. Single lead-covered wires were run some stance apart, and holes drilled in the centre of the joists, d the wires threaded through, tubes being put in to protect e wires when they came down to the switches. This had oved quite satisfactory. He used paper-insulated leadvered wire, and simply taped the ends. He earthed the d or conduit to the lead-covering of the service cable. He ought it was necessary to earth even in private installaons, because frequently the gas pipes were left in, and the ole of the gas supply was not cut off, and it was very diffilt to ensure that the workmen had not allowed the conduits the lead-covered wires to touch the gas pipes. It seemed him that the cost of wiring could be considerably reduced the use of a double-wound transformer and 25 volt lamps, which case there was absolutely no necessity to use fuses of y kind.

Mr. F. Ayton (Chief Electrical Engineer, Ipswich) said still pinned his faith generally to wood casing. In dry aces a cheaper quality rubber wire could be used, and in mp places casing could be made reasonably safe by using rcelain roller insulators and coating the casing with a terproof paint. The weak point in wiring work was the flexible. A very important point was the rating of switches, and it was one which ought to be taken up either by the Association or the Engineering Standards Committee. They should be rated on the wattage basis, and not in amperes. They also wanted some standardisation in switches and ceiling roses in regard to the position of the entry holes for the wiring through the block. Standardisation could also be carried to wall plugs, as there was difficulty in getting interchangeability, especially with china plugs, which were easily broken. When sending round irons on approval, in every case he sent a Pragnell adapter, which enabled the consumer to use the light whilst he was trying the iron.

Mr. A. J. Cridge (Electrical Co., Ltd.) urged the necessity of not reducing quality too much in the effort to cheapen wiring. He also said that the assistant entrusted with the testing of installations should have common sense, and should not have so great an idea of his own importance as to enforce regulations in cast-iron fashion.

Mr. W. A. Walker (Chief Electrical Engineer, Kettering) said that he had drawn up a schedule of prices for wiring houses upon which any contractor could canvass, and for screwed conduit the price per point was 22*s.* against 22*s.* 6*d.* in the paper. This included pendants and lamps. He paid per point for wood casings 19*s.* against 17*s.* 6*d.* in the paper, but he thought the latter figure was too low. Was the wood treated with shellac, or was it plain?

Owing to the shortness of time, Mr. Beauchamp will reply in the Proceedings.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) illustrates fully by photographs and reproductions of working drawings the recently-completed Union Passenger Station at Worcester, Mass., of which Messrs. Watson & Huckel are the architects. The issue also contains illustrated articles on the replanning of Philadelphia and on the illumination of the cathedral of St. John the Divine, New York.

Der Architekt (Vienna) contains illustrations of the Austrian pavilion at the International Art Exhibition now open at Rome, of a tenement house in the 17th Bezirk of Vienna, of a premiated design for the Law Courts at Sarajevo—all advanced "new art"—and, for contrast, a picturesque view of old work at Stein, on the Danube.

Arkitektur og Dekorativ Kunst (Christiania) gives an account of a competition for a branch library in the Schous

Plads, Christiania, with reproductions of plans and perspectives of several of the designs submitted. Proposed improvements in the town-planning of Lille Lungegaardsvand at Bergen are described and illustrated.

Arquitectura y Construcion (Barcelona) has a number of illustrations of the new cathedral at Vitoria, of which the architects are Don Francisco Javier de Luque and Don Julian Apraiz. The design is a very ornate conception in late Gothic treatment, somewhat reminding one in general lines of the Votive Church at Vienna.

La Construction Moderne (Paris) illustrates a quaint seaside cottage at Cayeux-sur-Mer carried out in brick and undressed flints, and hence named "Le Pavé." The architect is Mons. R. Faucon. A design for tapestry by the architect, Mons. Hannotin, is also illustrated, and the article on Baalbec is continued, with illustrations.

Construction (Toronto) contains an illustrated article on the recent catastrophic fire in a ten-storey building in New York by which 141 lives were lost, in which the illusive fire escapes there constructed are contrasted with some English examples. Recently erected buildings well illustrated are the new Victoria College Library building, Toronto, by Messrs. Sproatt & Rolph; the new Bonar Presbyterian Church, Toronto, by Mr. A. McKenzie Brydon; a small house at Port Credit, Ontario; and another at Geoffrey Street, Toronto.

Deutsche Bauzeitung (Berlin) continues its series of articles on modern school-buildings and crematoria. In the former the Reform-Real Gymnasium at Mariendorf, near Berlin, is described and illustrated, and in the latter the crematorium at Dresden.

Stone (New York) illustrates a fifteenth-century doorway by Antonio Gambello and Pietro Lombardo at the church of San Giobbe, Venice, and a chapel at Evanston, Illinois, which is a good example of the use of correct Perpendicular detail by Mr. John Sutcliffe. Failures of concrete and terra-cotta buildings are described in the interests of the stone trade and of masonry.

The *Western Architect* (Minneapolis) has an interesting article on the early architecture of New England, and of modern work illustrates the first Presbyterian Church at St. Joseph, Missouri; the Boston Building, Salt Lake City; the Y.M.C.A. building, Carlisle, Pennsylvania; an apartment building at Detroit, and some small detached houses.

Engineering Record (New York) describes a "cement gun" used for handling cement mortar by compressed air and applying it in any required thickness to iron or steel work or other base.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

King Edward Memorial.

SIR,—My avocation warranting giving all my time to Imperial matters externally prevents me in giving any time in joining issue with your excellent artistic weekly *a propos* the preposterous site selected for the above memorial to the most peacefully inclined monarch of all time. In my crude and amateurish power of observation I enclose a rough tentative sketch *a propos* a suggested site that appeals to my contemplative mind, viz. in the front of the birth-place of the World's White Queen Victoria, Kensington Palace, in the centre of the Round Pond, and with a grand sylvan vista down to the banks of the Serpentine, and for all budding Britannic scions to appreciate the maritime *tout ensemble* it suggests for all that, how this limitless realm of ours at heart, and to hand down untarnished and hallowed amidst peaceful surroundings, and having no duplicate of environment in the heart and centre of Britannia's realm.—Yours truly,

LIEUT. G. DAVIES, R.N. (retired).

July 24.

[Our correspondent's sketch is too rough for reproduction.—ED.]

Standard Catalogues.

SIR,—I have been surprised at the receipt during the past week of a circular from The Standard Catalogue Publishing Co., Ltd., intimating that five volumes of "Architects' Standard Catalogues," handsomely bound in half-cal leather, will be sent to me, carriage forward, at the end of Sep tember. The name of this publishing company is new to me but as the circular is addressed from Bloomsbury Hall, th office of the Architects' Technical Bureau, I can only presum that the Publishing Company and the Bureau are branche of the same concern, and that the present I am to receiv "carriage forward" is a duplicate of the circulars I hav paid for as a subscriber to the Bureau.

With these circulars, as with the information I cannot g from the Bureau, I am grievously disappointed, and I ha already contemplated discontinuing my subscription to th Bureau. This latest move settles the question. I cann understand how the eminent architects whose names appea on the publications of the Bureau can lend their suppo to this concern.—Yours, &c.,

F.R.I.B.A.

London Hydraulic Power Company.

SIR,—I am instructed to thank you for the notice this company's new pumping station in Grosvenor Roa which appeared in your issue of the 14th instant, but ther are a few inaccuracies to which I must call your attentio Messrs. Mowlem & Co., and not the Hydraulic Engineerin Co., of Chester, were the contractors for the reservoirs; th cast-iron tanks were supplied by the Horseley Compan and the boilers by Messrs. Babcock & Wilcox. The stea pressure on the pumping engines referred to in the la paragraph but one is 180 lb. and not 80.—Yours faithfull

T. M. BENDALL,
Secretary.

London Hydraulic Power Company,
Palace Chambers, 9 Bridge Street, Westminster, S.W

Hyde Park Corner.

SIR,—In face of the announcement which has been ma to the effect that a combination is prepared to give million sterling for the site of the St. George's Hospital order to erect thereon a new hotel, may I renew a propos I made more than two years ago?

At that time Colonel J. Charlton Humphreys had ju acquired the freehold of the Knightsbridge Estate, and n very shortly the houses in Trevor Square, and, indeed, t property on the whole estate, is to be taken down. N only are new buildings to be erected, but new road planni is proposed.

Here is a quiet spot in close proximity to Hyde Pa Corner, an ideal site to which the St. George's Hospit might be transferred from the extremely valuable, but, f the purposes of a hospital, most unsuitable site it now occ pies.

Such a change would at one stroke advantage a gre public charity and make available the unique site at Hy Park Corner, in many ways the most conspicuous in t Metropolis, for an opera house, or other building of a li character.

It can only be a question of time when the Hospit will be removed, and the site offers such opportunities f a public building that it would be a thousand pities for to be acquired for the purposes of an hotel.—I am, &c.,

MARK H. JUDGE.

7 Pall Mall, S.W.: July 24, 1911.

ANSWERS TO CORRESPONDENTS.

"JUSTICE" (C.F.).—Although you appear to have be treated very shabbily, you have no legal remedy in the abse of a contract in writing. A solicitor's letter might get y a part of the claim, but we cannot advise you to go farth

MESSRS. ASHLIN & COLEMAN, architects, Dawson Stre Dublin, have prepared plans and specifications for the co pletion of the tower and spire of St. Colman's Cathedr Queenstown.

THE foundation-stones of a new Training College at Swa sea were laid on the 20th inst. The College, when built, w accommodate 200 students, and the site, comprising nea twelve acres, is magnificently situated on the hill at Gla mor, overlooking the Swansea Bay. The building will faced with native stone and Forest of Dean stone dressin The contract price is £37,317 19*s*. 11*d*. Messrs. Lloyd Br are the contractors, and the architect is Mr. S. E. T. FORTHCOMING EVENTS.

Saturday, August 5.

Architectural Association : Excursion of Camera, Sketch and Debate Club to Bishop Stortford and district (August 5-7).

Monday, August 7.

Royal Society of Antiquaries of Ireland : Ulster meeting opens at Belfast (closes August 12).

Northern Architectural Association : Students' Sketching Club Annual Excursion.

Tuesday, August 8.

Guild of Architects' Assistants : Visit to London Opera House, Kingsway (Mr. Bertie Crewe, architect).

Friday, August 11.

Architectural Association : Forty-second Annual Excursion to Tours and Loire Valley (August 11-20).

Tuesday, August 15.

Manchester Society of Architects : Visit to Messrs. Edward Wood & Co.'s Ironworks, Ordsall Hall.

Saturday, August 19.

Manchester Society of Architects : Visit to Chester Cathedral and Eccleston church (the late G. F. Bodley, architect).

STUDENTS' WORK AT SOUTH KENSINGTON.

THE annual exhibitions at South Kensington of works by art students throughout the country comprise work submitted by pupils of metropolitan and provincial schools of art in the national competition for prizes and specimens of the work done during the past session by pupils of the Royal College of Art.

The latter may be supposed, at any rate in London, as containing the *crème de la crème* of art students, as it is especially intended for those alone who intend to practise as professional artists or as teachers of art, whilst the general schools of art are open to the amateur and dilettante who not only are apt in themselves to be slack and easy-going in their methods of study, but are often the cause of slackness in others to whom art is, or should be, a matter of deeper concern as their prospective means of livelihood.

At the Royal College of Art architecture is fully recognised as "the mistress art," and all students, whatever their ultimate goal, must devote the first portion of their time to the study of architecture and architectural design. This has a twofold effect. The sculptor and the painter find their work influenced by a tendency to restrict its scope as an adjunct to architecture. The architect regards his building as a field for the display of painting and sculpture. Thus the Royal College of Art is a school in which by art is understood the alliance of architecture, painting and sculpture, and including as subservient branches all other decorative arts and crafts. In other words, art as applied to buildings is the dominant subject of study in the Royal College of Art.

In the works submitted for prizes in the National Competition of Schools of Art, one seems to see quite a directly opposite point of view. There architecture is, when not entirely ignored, unappreciated and misunderstood. Even the express teaching of architectural design is, as judged by the results produced, of a very low order. There would seem to be prevalent an idea that the domain of art can be complete without architecture.

The evil conception of art that the British public imbibes from the annual exhibitions of the Royal Academy that oil painting on canvas in gold frames is the only real work of art is capable of refutation by a well-organised and well-boomed annual exhibition of prize work in the National Competition of the Schools of Art, but this collection will not do what it might as long as it is buried away in a stuffy shed in the backyard of science museums and schools. To render the education of the Philistine complete, architecture must be presented in a more correct aspect than in the National Competition, hence we need the tonic of the Royal College of Art.

We think strongly that the Board of Education should feel it to be their duty to educate the Philistine in an appreciation and comprehension of art. It is a duty they owe to the many students who are spending time and money in schools of art. There have been submitted in the National Competition this year 13,153 works, of which 1,924 are considered by the judges worthy of reward. What is the use of all this effort and hard work if there is to be no market for good and genuine artistic work? Why train students unless you can ensure that the results of their study will be intelligently appreciated?

In the Royal College of Art exhibition the work of the lower division of the School of Architecture is represented by a set of drawings made by one student, F. S. Smith, showing that studies are first made of old work and then a design based upon these. The school is fortunate in having in Mr. Smith a student who can draw and whose designs are of considerable merit, hence a very favourable show is made by a representative whose level of achievement is, we imagine, rather above the average.

In the upper division there are the first year's course and the advanced course, the latter being intended for students specialising as architects. The subject of study in the first year's course was the design and decoration in colour of a domed memorial church, and twenty-two sets of drawings are exhibited. In these the colour decoration is, as a general rule, far better than the architectural design. There is scarcely an instance in which a successful dome has been evolved, and although several have made studies of the church of the Madonna di San Biagio, Montepulciano, the authors usually commit the fault that is there avoided and make the drum of the dome too high. The design of the dome seems to have been spoilt by a desire to get the maximum of space for the colour decoration.

In the advanced course work we were rather surprised to see two designs submitted in the competition for the Tite prize this year, that of Mr. G. H. Foggitt, who won the prize, and that of Mr. W. G. Newton, whose drawings deservedly attracted much attention. Designs at the Royal College of Art are, presumably, made under the direction and with the advice of instructors, and the Council of the Royal Institute of British Architects will have to consider, in view of what happened in the case of the Soane Medallion and this latest revelation, whether further rules and regulations should not be incorporated in the conditions for the annual competition. It is obviously unfair that some competitors should prepare their designs under skilful supervision and others in the seclusion of their own bedrooms. If assistance is permissible, both that of the "patron" and the "nigre" must be allowed. Then we shall probably have the establishment of the "atelier" where both can be obtained. We are not prepared to say that this is inadvisable, but if permitted it should be openly recognised, even though it be a departure from the unwritten but well understood law governing the student competitions of the Royal Institute in the past.

Mr. Newton's design for the decorated memorial chapel shows more originality than many. Possibly the theme he has selected, a memorial to the pioneers of flying, has inspired him with the desire to break away from the traditions of the past.

Whilst Mr. Foggitt and Mr. Newton were busy on their Tite designs others of their fellow students appear to have been engaged in designing a façade for a palace. Mr. S. Clough has for his design studied Greek motifs as exemplified in the Euston Road. Mr. S. Small has a design which includes some good if more conventional detail, but is spoilt by a dome à la Wilkins. On the whole we consider that the work of the School of Architecture shows a distinct advance on that of past years and stamps the Royal College of Art as an admirable "finishing school" for the architect student who has passed the ABC stage of his study. It is not advisable for the tyro who has yet to learn how to use pencil and brush with ability and facility.

In the School of Sculpture and Modelling there is some really excellent work and a satisfactory combination of architecture and sculpture, particularly in the sketches for a fountain in commemoration of the reign of King Edward VII., to be placed in front of a pavilion. The sketches in the round are supplemented by photographs of the same design carried out to a larger scale. That of Mr. W. McMillan, who wins the travelling studentship of the school, is a fine piece of design, with a statue of the King on a lofty pedestal in the centre of flanking screen walls with sculptured panels and life-size emblematical figures at the ends; but there are several other beautiful designs, generally more allegorical in treatment. Some of the sketches for a pair of bronze doors for a palace of art and music are also admirable. Of these we prefer that of Mr. E. G. Pritchard, which is superior in its composition and proportioning of the panels.

In the remaining work of the Royal College of Art the School of Painting and Mural Decoration is dominated by its subservience of painting to mural decoration. Perhaps the best of the sketches are those for the historical subjects: Margaret of Anjou entering the city, by Mr. L. Preston and Miss E. A. Waite; Titus Oates in the pillory, by Mr. H. B. Wright; and the Burning of Newgate by the Gordon Rioters, by Mr. R. Gill. Mr. J. D. Revel has a good design for decoration on a ceiling, the subject being "Inspiration with Caprice and Fancy." The same artist's sketches for the historical pictures show much ability of composition and a good feeling for colour.

Museum studies rather than original designs are the most satisfactory work in the School of Ornament and Design, though there are some good designs for stained glass by Mr. W. P. Huggill. In the designs for room decoration those of Mr. A. B. Allen for a stone fireplace and a tomb show an intelligent study of the work of Alfred Stevens; but some others, as those of Mr. H. Brown for the decoration of a dome, of the apse of a church, and of the east end of a church, as well as Mr. J. F. Greenwood's design for the latter subject, show that their compulsory study of architecture has been insufficient, and for the credit of the school their drawings ought scarcely to have been exhibited.

In the National Competition one of the gold medals has been awarded to a modelled and carved design for a fireplace, by Mr. William H. Wright, of the Nottingham School of Art. This is a combination of architecture and sculpture, which until we referred to the catalogue we thought to be a design for a monumental doorway. In the architecture Greek Ionic columns of correct proportion and detail are surmounted by an entablature minus the frieze; the sculpture is an excellent bas-relief panel executed in marble. Two of the gold medals are won by jewellery, Mr. Thomas Cuthbertson, of the Margaret Street School of Art, Birmingham, and Mr. Edward Joseph, of the Camden School of Art, Islington, being the winners. Both of the designs are of high excellence, the former in gold and the latter in silver, and both for necklaces.

A very interesting set of studies of the historic treatment of heraldry as exemplified in English seals and fictile examples from A.D. 1100 to 1700 in Warrington Museum wins for Mr. Sydney W. Clatworthy a gold medal. Other gold medals are won by Miss Christine Gregory, of the Hammersmith School of Arts and Crafts, for a modelled torso from life; by Mr. Albert G. Power, of the Dublin Metropolitan School of Art, for a model of a figure from the nude; by Mr. Harry Clarke, of the same school, for stained-glass design, which the judges, rightly in our opinion, characterise as "a very remarkable effort in the highest class of art, full of vigour and character, earnest feeling, richness of conception and great resource in design and detail." The remaining gold medals are granted to a charming design for an enamelled silver potpourri jar, set with amethysts, by Miss Jean Campbell, of the Camden School of Art, Islington; a shaded drawing of a figure from the nude, by Mr. Horace Quick, of the Clapham School of Art; and a design for a woven tapestry hanging, by Mr. Robert B. McCoy, of the Macclesfield School of Art. This last is excellent in composition and colour, with a refreshing variety of motif that gives interest to a design which by its nature entails repetition of a given pattern.

Besides the gold medal winners there are other noteworthy competitors in the class of modelling design with architectural features, but the general failing throughout is that the architectural treatment is not entirely satisfactory. Silver medals have been won by Alexander Stiles, of the Westminster Technical Institute School of Arts, for an excellent design for a tomb; by Louis C. Collier, of the Nottingham School of Art, for a lamp standard, which must have succeeded by its general conception, as the judges point out that it is "weak in outline and in the profile of the mouldings, and faulty in scale." A third silver medal is obtained by William D. McNeill, of the Liverpool School of Art, for a figure forming part of the tympanum of a pediment, although this is defective in its architectural treatment.

In the architectural designs Mr. Bertram Lisle wins a bronze medal for his Soane Medallion design for an entrance gateway and bridge to a capital city; Mr. Bernard Dangerfield for his design of a Campo Santo; and Mr. William A. Ross for a design for a public place situate upon the bank of a river. Mr. Ross gets a bronze medal also for a measured drawing of the portal of Bordeaux Cathedral from a cast in the Victoria and Albert Museum. Thus in the architectural section of the National Competition we find further illustration of our remarks above on the Institute annual competitions for prize designs.

There are in the exhibition some very good examples of modelled architectural detail and drawings in monochrome from the cast of similar subjects.

NOTES AND COMMENTS.

At the twenty-third annual meeting of the National Society of Art Masters held last week, Mr. R. G. Hatton, of Newcastle-on-Tyne, who presided, was, we think, a little too optimistic when he said that we have no need now to plead the cause of art, but that our great trouble is to keep up with the quick pace with which the understanding of it is moving. We doubt whether the time has yet arrived when there is any general understanding of art. There may be an increased appreciation or, at least, recognition of art as something that is worthy of consideration, but this does not amount to comprehension.

Therefore we are in accord with Mr. Hatton when, in summarising the creed of the Society, he said that they claimed that the people had a right to sound education in art, apart altogether from questions of trade or vocation. They claimed that all persons should have the opportunity of studying during their youth and early manhood any subject which they cared to study. They believed that their value as citizens greatly depended upon that study, and that the success of our country in art depended very greatly upon the proper provision of opportunities for the practice of it during those ten or twelve years of serious and enthusiastic activity which succeeded to one's schooldays. They claimed that a city or a county had not adequately provided educational opportunities unless it had established a sufficient number of schools of art reasonably accessible to the public.

Whilst on the Continent and in America the building of costly and beautiful railway stations is so general that it must be taken to be a desirable investment of capital, our own railway companies seem to be bent on adding a trifle to their income by scattering little trading kiosks for the sale of all manner of articles, thus belittling whatever dignity their stations may possess. The London, Chatham and Dover Railway Company propose to go a step further and erect shops with three floors over on a portion of the forecourt of Ludgate Hill station. True, this particular station is not a thing of beauty, and its eclipse need not on that score be regretted, but the proposal if carried out will considerably increase the overcrowding of the day population in the City's square mile.

The rebuilding of the campanile at Venice is now practically completed, and Sansovino's loggietta has been reconstructed with the greatest care and skill from the fragments into which it was shattered by the fall of the tower.

In the *Art Journal* for this month the series of articles on "Interiors of English Mansions" is continued with further details of Holkham. These include not only some of the sculpture but excellent views of architectural design, amongst which are reproductions of Kent's original designs for the front of the house and the interior of the library. A coloured plate is given of one of a pair of English enamelled fire-dogs. "Tapestry weaving in England" reaches its second chapter with some good illustrations. The "Kent" furniture at Devonshire House is described by Mr. Francis Lenygon, accompanied by some superb illustrations. Sir Claude Phillips discusses the authorship of the fine "Portrait of a Genoese Nobleman," ascribed in the Dulwich Gallery collection to Vandyke, but which Sir Claude is inclined to credit to Rubens.

This month's number of *The Connoisseur* contains an interesting and fully illustrated article on "Some Remarkable Stoves," as exemplified in German, Swiss, and Austrian interiors, of which they form striking centres of interest. A series of articles on Albrecht Dürer woodcuts is commenced, accompanied by well-printed reproductions. The Spottiswoode collection of Rhodian ware, with numerous illustrations, is the subject of a leading article.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

(*Continued from last week.*)

Wednesday, July 26.

TUESDAY, the opening day of the Institute's summer meeting, was devoted to Cardiff as described in our issue of last week. The excursions to places in the neighbourhood began on Wednesday morning by a train journey of seven miles to Caerphilly Castle (*vide* plan in Supplement, p. 12), which is the most extensive in South Wales, and is reputed to cover with its outworks about thirty acres. It is said to be both the earliest and most complete example in Britain of a concentric castle. The castle was begun by Gilbert of Clare, Earl of Gloucester, about 1267. One of its most unusual features is the elaborate system of water defences by which the whole castle could be surrounded with a broad and deep stretch of water from the neighbouring brook, the Nant Gledyr. The presence of this water explains a good many points in the plan which otherwise would puzzle the visitor. The main entrance was through a gate in the curtain walls 250 yards long on the east side. Behind this wall on one side was a great earth embankment which acted as a retaining wall for the water; and with the object of further resisting the pressure of the water the wall was strengthened by buttresses and towers on its outer face. From the earth embankment a bridge, partly fixed and partly movable, gave access to the castle mound. Its gatehouse had a turret on each side; there was a similar gateway on the opposite side. Behind this yet another strongly fortified entrance-gate confronts the visitor before the inner ward is reached. On the south side of this enclosure was the lofty hall 73 feet by 35 feet, the cellars with the chapel above, the private apartments, a tunnel-like entrance leading to the water level, and other features. In its general lay-out the castle bears some resemblance to Berkhampstead. Mr. W. H. St. John Hope, M.A., in his account of this wonderful building, expressed his conviction that it was all according to one definite plan, although the time covered by its erection may have been fairly extensive. The material throughout is coursed ragstone, very little ashlar having been used. To most people the most attractive feature of all is the noble great hall. Here Mr. Hope pointed out many interesting details. The surface still retains the Edwardian whitewash, which, as Mr. Hope remarked, was not a modern churchwarden's vice, but a virtue of the Middle Ages. The wooden roof was supported on clustered corbel shafts. The present simple roof was erected by the Marquis of Bute, the owner, forty years ago. Looking into the inner ward are three delightfully narrow and high windows, from which the tracery is missing. The glass for these was inserted into wooden frames which were wedged into a rebate on the outer face of the jambs, while saddlebars prevented its blowing inwards. On the same side was the broad Tudor fireplace, which is a remarkably early date for that feature. The mighty ruins are sufficient to stir any imagination, and it is easy to re-people the hall with men-at-arms, guests of low and high degree, and the lord with his châtelaine at the daïs end, looking through the bow window into the broad inner ward—the scene itself of many a joust eagerly watched by gentle maidens and fierce men from the surrounding walls and open casements. It is more accurate to perhaps conjure up scenes of peace because the castle never played a prominent part in military history, although adapted to do so by the architect.

The party returned to Cardiff by rail. After lunch, a motor journey of some two miles brought them to the ancient city of Llandaff.

Llandaff Cathedral.

Although the present structure goes back to A.D. 1107, when Urban was appointed by the Normans as Bishop of the 500-years-old diocese, the connecting chain has some very weak links which only escaped breaking by a hair's breadth. Seven hundred years after Bishop Urban was dead the then prelate found himself in possession of a cathedral, which was probably of no more use than that which awaited Bishop Urban, for it is recorded that Bishop Ollivant (1849) found his cathedral almost a ruin and left it fully restored. The Dean, who acted as guide to the party, mentioned that long before Norman times Llandaff was a centre of missionary work. Tradition asserts that King Lucius erected a church here about 170. St. Dubricius was the founder of the see of Llandaff, "the church on the Taff," in the year 500. He was of royal blood, and here he put up a church and gathered round him a body of clergy for missionarising the country. It made the third educational institution in the neighbourhood. Llandaff was during some four hundred years the centre of Christianity in this part of the country. When the Normans came they found things in a great state of collapse owing to the depredations of the Danes or North European tribes. Consequently with the Normans a new era began, and they put up a building which naturally would be up to date; and with the new style a new Continental system was introduced. There was a great wish to bring about a better state of things in place of the existing dilapidation. Moreover, Bishop Urban, the first Bishop appointed by the Normans, was anxious to have something to rival the shrine of St. David in the western part of South Wales, which was becoming very popular as a place of pilgrimage. Accordingly in 1120 he translated the remains of Dubricius and built a shrine to his memory so as to give point to the new church. The curiously ornamented arch over the high altar shows part of that work. How far the church was completed it is difficult to say. It was commenced and carried out practically with the money collected under an order of the Archbishop of Canterbury from every church in England. It was sufficiently complete at the time when Baldwin came to preach the Second Crusade for him to hold services in the building and preach from the village cross. Later the Norman church was considerably altered and the nave was extended to its present length, and the ground plan practically took its present shape. Towards the middle of the thirteenth century it was found requisite to have a chapter house on the south side of the presbytery, for although a chapter had been formed there was at first no chapter house. Soon afterwards there came a Bishop, William de Braose (1266), who was anxious to be once more up-to-date, and accordingly he built beyond the chancel arch a Decorated Lady chapel such as was then becoming popular. In order to enable the customary procession to still make the complete round of the church it was necessary to extend the aisles and to effect other alterations. The north-west tower was built in the fifteenth century. In Henry VIII.'s time things were so unsettled that the church became very dilapidated. With the Restoration there came an attempt to make things a little better, but little or no money was available. At the end of the seventeenth century the choir was broken up and things fell more and more into a state of dilapidation. In consequence of all this it became a question whether the cathedral should not be transferred to Cardiff. The services, however, were still continued in the Lady chapel. In 1723 the south-west tower was destroyed by a storm, and in its fall ruined a considerable part of the nave. Some ten years later a national appeal for funds was made, as a result of which £7,000 was collected. Wood, of Bath, was engaged to fit up the presbytery for service, and he designed a sort of Italian temple of miserable appearance to be put up within the nave. About 1835 the spirit of revival reached Llandaff, and immediate steps were taken to begin improvements, which were not completed until 1869. A commencement was made with the Lady chapel. Later the ruined west end of the nave was taken in hand and the pseudo-classic temple was cleared away. The work was put into the hands of Sir Gilbert Scott. There were just sufficient remains of the preceding structure to guide the restorers, chief of whom was Mr. John Pritchard, of Llandaff. Nearly £40,000 has been spent on the building. Not far from Llandaff is

St. Fagan's Castle.

To call this a castle now is somewhat misleading, for it is nothing more than a charmingly gabled sixteenth century house standing on the site of a castle. Very little of the earth or stone work of the preceding structure remains, except a small forecourt with terraced wall. It was in Norman times held directly under Robert Fitz Hamon, Earl of Gloucester. The various apartments contain some fine oak panelling, old furniture, and other objets d'art. One of the most interesting things is the wonderful circular lead cistern in the forecourt dated 1520, with a double row of panels all of the same formal design. An invitation to tea had been extended to the party by the Right Hon. the Earl of Plymouth, and with it permission to roam over the beautiful grounds. These latter depend for their charm chiefly on the flowers rather than on architectural disposition in relation to the castle. The gardener's triumph is complete in the number of blooms, the beauty of colour and their striking contrasts of massed beds, and in the rosaries, pergolas, sunk beds, and other devices. If it were not invidious in a guest to find fault one might be tempted to protest against the numerous raw brick chimneys lately put up all over the castle roof, and for which a wire-cut brick of most unsympathetic texture has been selected. The castle walls are of stone, with a coating of stucco to counteract the porosity of the local quarries.

In the evening a paper, illustrated by lantern views, was read at the City Hall by Mr. John W. Rodger on

The Stone Cross Slabs of Glamorgan.

About 840 he said the following law was passed by Kenneth, King of Scotland: "Esteem every sepulchre or gravestone sacred and adorn it with the sign of a cross, which take care you do not so much as tread on." Of all symbols the cross is perhaps the most familiar. It is nearly always symbolic. Nothing is known of its origin further than that, in times long before the Christian era, it was known to the Babylonians and Assyrians, as well as in India, Thibet, and to the most ancient peoples of Europe. Professor Evans found in Crete a type of cross with a small base to each foot as a distinguishing mark of a small series of rooms in the Palace section at Knossos. He also records that "on some blocks, apparently belonging to the earlier Palace, a plain deep-cut cruciform sign with equal limbs and others shaped as a cross saltire are also found, and these types occur at Phaestos." These dated from nearly 2,000 years before Christ. In 1903 an actual cross of fine veined marble and of orthodox Greek shape was discovered at Knossos. From its position and associations it was a possible conclusion that it formed the centre feature on a small shrine dating back to 1650 B.C.

No originality can be claimed for the cross when used as a sign in Christian times, for it may be said to have had its origin in one of the earlier symbols which expressed the name of Christ by means of a monogram formed of the Chi and the Rho—the first two letters of the Greek word ΧΡΙΣΤΟΣ and known as the Chi-Rho and also as the sacred monogram. This monogram is supposed to have been the celestial sign seen by the Emperor Constantine on the eve of a battle in which he overthrew Maxentius. It was afterwards placed by him upon the imperial standard and was stamped upon the imperial coins till the fifth century. Although used by Constantine the monogram was not his invention, but an adaptation with a special significance. It had appeared in other forms at different times. One form is used as an abbreviation upon coins of Herod I., B.C. 37 to B.C. 4; another was used on Phrygian and Lydian coins of the time of the early Roman Emperors. Before A.D. 312 the Chi-Rho was in frequent use as an abbreviation of the name of Christ, but its use as an actual symbol of our Lord on Christian monuments is not proved until about A.D. 323, and from that time forward was universally recognised as signifying the name of the Saviour. It was used wherever such a mark could be placed and still bear a sacred significance. The development of the Christian use of the simple cross from the monogram has been worked out by the late Mr. J. Romilly Allen from examples found in these islands. The loop on the Rho gradually faded until nothing but a plain cross of Maltese form was left. The cross and the monogram ran concurrently for about 200 years from the fifth to the seventh centuries. This proved connection established the great central fact that the cross in its original conception stands simply as something expressive of the whole being and character of our Lord.

Probably the earliest dated example of a true cross as a Christian symbol is at St. Peter's, Rome, A.D. 395. It did not become common until the fifth century, and in Britain it usually belongs to Anglo-Saxon or later times. In some excavations in the Roman fortress at Gellygaer a large flat brick was discovered on which had been scratched a cross in a circle while the brick was still plastic. It probably dates from the second century. But this was presumably merely a whim on the part of the worker or an identification mark rather than a Christian symbol any more than are some other early crosses found in this country.

With regard to the earlier incised cross slab of South Wales very little can be said. The workmanship is rude, the stones frequently unshaped, and the crosses themselves very much exaggerated. It is very difficult to date individual stones with any degree of certainty, as they have no connections that can be traced in history; but as a group they may be contemporary with the Celtic knot-work designs—say from the seventh to the tenth centuries. About the middle of the twelfth century heraldry became a science in this country, and from that period onwards it is not unusual to find heraldic crosses carved on tombstones. The Latin cross, the Greek cross, and the Maltese cross were all known to heraldry and are of common occurrence upon tombstones. The altar cross is another form, probably the most familiar to the working stone-cutter of that time, and it is interesting to see how the feeling and features of crosses in latten or brass were copied into stone. It is not known when the cross was first placed on the altar, but in a document of 1246 an altar cross is mentioned. It is, however, most probable that it existed in that position long before its recorded time. Another favourite form is that of the processional cross, which was carried in the hand and had no base. These are represented as lying on the stone and usually terminate in a fleur-de-lys.

In the eleventh, twelfth, and thirteenth centuries slabs are rarely inscribed; or where such is the case it takes the form of a brief statement such as the "Hic Jacet Rudolphus" at Chester. Instead of long inscriptions relating to the deceased the stones were marked with designs beautiful in their conception and reverent in their symbolic meaning. In the Vale of Glamorgan many of the slabs from the twelfth to the fifteenth centuries are flat domes, from one of the thinner beds of the blue lias formation, selected with a fairly smooth face, but otherwise entirely unprepared, and on this the design is traced by a process of freehand and cut with an incised line having little regard for regularity.

There is a class of stones of distinct fifteenth century type. The influences which affected architecture during the mediæval period and brought about the changes in styles, altering the deeply-cut mouldings and pointed arches of the thirteenth century to the flat examples of the fifteenth, can also be observed on the cross slabs. The fleur-de-lys with its bold rounds and hollows gave way to a flatter treatment, partaking largely of a fifteenth century moulding when seen in section.

In 1643 an order was promulgated for the destruction of

"Crucifixes, crosses and all images of any one or more persons of the Trinity." Cross slabs must have existed in large numbers prior to the seventeenth century, and those which remain are what escaped destruction during those troubled times. In dealing with the fabric of an old church it is no uncommon thing to find cross slabs used as building-stones on account of their suitability either for footing courses, lintels or doorsteps; many have been found buried in the soil under church floors, or turned upside down and used as paving-stones. This legislation no doubt bore hard upon some consciences, and it is not surprising to find that stones cast away at one period were rescued and recut with other names later. There are many examples of this treatment in South Wales. From the time of Elizabeth to that of Anne, in place of the delicate and refined features of the earlier crosses we have a heavy expressionless type, devoid alike of artistic feeling and sentiment and prepared as it were to hold its own by sheer force and weight. However, the symbolic idea had not disappeared.

A distinct class of cross is that consisting of a central cross with two smaller crosses branching from its stem. These have been referred to as "Calvaries." As in a Continental Calvary the central cross has figures of St. Mary and St. John on either side, with three crosses, the slabs may have been a survival of the same idea. Triple-branching crosses appear to be peculiar to this neighbourhood. In some cases instead of two branching crosses there are two bars or billets. Having in mind the Continental Calvary with a central cross and an isolated figure on each side and the triple crosses of Glamorgan it is not difficult to imagine the process of evolution by which the billet slabs would come to represent the same idea.

Crosses may be grouped in order either of date, of similar features, or by some symbol or emblem associated with the cross.

Thursday, July 27.

The distance to St. Donat's from Cardiff being a considerable one, the first part of the journey was made by training to Llantwit Major, and then continuing in motors to

St. Donat's.

Although St. Donat's Castle (*vide* plan in Supplement, p. 12) is not a showplace it has been truthfully described as "unquestionably one of the most perfect of the ancient baronial halls of Wales." It was obviously regarded by all as one of the most fascinating places. Its charm was probably in some degree due to the pervading sense of homeliness, as distinct from a residential museum. It occupies a most romantic site, commanding the Bristol Channel. The earliest part of the building dates from the fourteenth century. The range of buildings is remarkably compact, and is within a practically circular wall. At the time of Elizabeth considerable alterations were carried out, although the general external aspect was allowed to remain unchanged. The earliest reference to the castle is found in the twelfth century, when this and St. Norcross were held by a family by virtue of their office as cup-bearers to the Earls of Gloucester—the family assumed the name of Butler. Then, either by marriage or by change of name, it came into the possession of Hawey, alias De Alweia. The last Haweys were people of property in Somerset and Dorsetshire. The family became extinct in the male line, and an heiress of the Haweys married a man of the name of Stradling, or Guillaume le Esterling. This family were merchants of high standing who dealt principally with the northern countries of Europe, and whose guarantee of purity gave rise to the word "sterling." The Stradlings made St. Donat's their headquarters. By subsequent fortunate marriages, as well as through holding many lucrative offices under the Crown, they greatly increased their estates. Sir Edward Stradling, whose monument is to be seen in the private chapel in the adjacent church, was a great patron of arts and letters. As he had no family of his own, or nephews or nieces to inherit the property, he selected a cousin's son as his heir and adopted him. This was the Sir James Stradling who was created a baronet in the first batch by James I. During the Civil Wars the family took an active part in the interests of the King, and greatly impoverished themselves thereby. Towards the end of the seventeenth century they were very considerably reduced in means. The last baronet died abroad in 1738. After his death there was considerable litigation, the property being claimed under various wills and settlements by several parties. The estate was thrown into chancery, but as the result of a compromise St. Donat's Castle fell to the lot of Lord Mansell, who only partially used it and by whom the structure was neglected. A recent purchaser, Dr. Nicholl Carne, made most commendable efforts to repair the damage done, and his good work was continued and completed by the father of the present owner, Mr. Morgan Williams. In his description of the building Mr. St. John Hope was emphatic in his praises of what had been done in the course of this most judicious of restorations. The aspect of everything was preserved as far as possible. The mouldings on the walls, &c., were left as they were found; and, in fact, only the necessary repairs were carried out. He also put into the rooms many valuable pieces of old furniture (all of which are genuine), and one of the best private collections of armour in the country. The hall is arranged on the customary plan, with screen at one end with gallery overhead, and a daïs flanked by an oriel window at the other. Below the castle and close to the sea is an extensive range of barracks in ruins. Mr. Hope mentioned he had been at pains to discover something about them, and he finally found that a Sir William Stradling held an important trust at the time of some threatened invasion of the coast. These buildings are, presumably, the range of barracks for accommodating the soldiers and others who were to hold the Bristol Channel.

Not the least charming feature of this castle is the hanging gardens which descend in great broad terraces to the sea-level, the lowest terrace being the enclosure for the soldiers' exercising ground.

The small church (*vide* plan in Supplement, p. 13) is placed on a steep slope west of the castle, from which it is reached by a flight of steps. Rev. L. E. Richardson, in giving an account of the church, mentioned that as St. Donatus was the patron saint of shipwrecked mariners, was it not probable that his name was brought to the place by the Sir William Stradling when he came as a new owner to the place in the thirteenth century, as the coast was a very dangerous one for shipping? The church is of twelfth century foundation. The greater portion of the existing edifice was put up by a Stradling. An especially interesting feature is the astonishingly preserved churchyard cross which has never been touched-up. Mr. Richardson said he had been told by a visitor that the cross had been spared in the era of general destruction because the then Lady Stradling, who was very charming, asked Cromwell that it should be spared for her sake. He gave the story for what it was worth. Another feature is the stone altar with its five incised crosses. and the consecration in the centre. Over it is a small metal processional cross dating from about 1470 which has been much restored on the lines of a similar cross. The Stradling Chapel, on the north side of the chancel, has an imposing altar tomb. The last of the line, Sir Thomas, was killed in a romantic duel at Montpelier. When his body was brought to St. Donat's to be buried it is said that his old nurse protested that it could not be Sir Thomas as it lacked the marks with which she was familiar. The church was restored very completely a few years ago.

The conveyances then returned to Llantwit Major, where the party took luncheon at the Town Hall. This, a rather picturesque fifteenth-century building, is reached by a flight of external stone steps. In the bell-cot is a mediæval bell bearing an inscription.

Llantwit Major.

Llantwit Major's chief claim to interest, said the Rev. H. Morris, rests probably in the honoured name it bears in the annals of early Christianity in Britain. Of its antiquity as a Christian centre there can be no doubt. It is said that St. Illtyd founded a monastery here in the year 508 and made it a place for instruction in general learning, as well as in religion. It was, in fact, a university; no less than 2,400 students, occupying 400 houses and seven halls, were resident at the same time. This university or school became a centre of religious life from which missionaries went forth to labour among the heathen or half-Christian peoples of Britain and Gaul. Many of these are still reverenced in Brittany. But it was also famous for the bishops and scholars it produced. St. David (the patron saint of Wales), St. Patrick (the patron saint of Ireland), St. Teilo (the second Bishop of Llandaff) were, it is said, among its students.

No traces of the first monastery exist, though the famous crosses collected in the western church (curious monuments of that early period) witness to the world of its antiquity and importance. Outside and around the church are other interesting remains, including a Roman villa to the north-east, a bold fragment of a mediæval gatehouse to the west, and a thirteenth-century pigeon-house with domical vault. On the south side of the churchyard is a two-storeyed house supposed to have been the residence of the chantry priests.

The church (*vide* plan in Supplement, p. 13) consists first of a chancel, a nave, north and south aisles, and a tower inserted in the west end; next of a western church with a south porch and parvise; and further west still is a third building in a ruinous condition which, when perfect, consisted of a crypt and a chapel on the first floor. To this building is attached on the north side a sacristan's house. The inner door of the south porch to the western church and the lower tiers of the masonry of this part are considered by Messrs. Holliday & Rogers, the restoration architects, to be part of the Norman church built early in the twelfth century. The piers of the porch are transitional Norman. It would seem, therefore, that the western church, known locally as the "old church," was originally the nave of a cruciform Norman structure which had also transepts and chancel. To this nave was added late in the twelfth century a central tower. In the following century changes were made, for the south porch was built with a parvise. In other respects the Norman nave remained intact, and was used as a parochial church. The tower also remained untouched. But the Norman transepts and chancel were removed to make room for an Early English conventual church with an engaged tower, arcades, and north and south aisles forming an extension of the transept eastward. Then a new chancel was built, with four lancet windows on the north side and an arcade and narrow aisle on the south. At the same time a chapel and crypt were added to the west end of the "old church." In the fifteenth century this western, or "old church," was taken down and rebuilt, leaving the Norman south door and portions of the lower Norman masonry in position, and it was re-roofed with the present oak roof. A door was inserted instead of a window in the south aisle of the eastern church, the south aisle of the chancel was removed, and the arcade built up with stonework, two windows and a priests' door being inserted between the piers. The east window of this chancel aisle was inserted at the east end of the south aisle of the nave, and a sacristan's house was added to the western or Lady chapel on its north side. A few additions were made when the church was repaired in 1905. Flying arches were inserted in the south aisle to support the arcade, and buttresses built on the west side of the tower in 1732 were partly removed.

There is, then, at present (summed up Mr. Morris) an Early English church with Perpendicular insertions, a Transitional tower, a Perpendicular western church with Early English porch, and an Early English chapel in ruins, with a fifteenth-century sacristan's house attached to it on the north side. The reredos is of stone of late fourteenth century date. In the south aisle of the eastern church is a niche with a Jesse tree. The roof of the western church has bosses carved with the arms of the Bassetts, Berkrolles, &c.

Mr. Iltyd Nicholl, in supplementing Mr. Morris's account, pointed out that, practically speaking, the clerestory windows are now of exactly the same appearance as before they were interfered with and blocked up. An altogether recent alteration was the large springing arches inserted in the south aisle of the eastern church for the purpose of propping up the walls, which still lean at an alarming angle. The floor of the nave was also slightly lowered, thereby removing its different level, and as a result of which the two squints are too high for use. The restoration of the fine stone reredos behind the altar was a simple affair, as it was only necessary to replace a few of the castellations on the top. In the eastern church there are remains of frescoes, including a great figure of, possibly, St. Christopher, of the two Marys, and a large royal coat-of-arms.

Mr. Harold Breakspear, F.S.A., pointed out that this church contained two features frequently met with in this part of the country—viz. freestone was sparingly used, and, in consequence, arches had to be of the full thickness of the walls; and also that the belfry windows were mere slits. The Raglan Chapel had galleries at both ends, that at the east end being for the exhibition of the relics, and that at the west, with its separate ascending and descending staircases, for the accommodation of pilgrims who came to view the relics.

Old Beaupré.

Standing about half a mile from a road and approached over fields is the most interesting ruined manor-house of Old Beaupré, which, for architect and archæologist alike, is of great attraction, if for no other reason than for its beautiful Renaissance entrance gateway. The party were met by Mr. D. Alexander, who suggestively entitled his account of the structure "The Romantic Story of Beaupré." The name, he said, is linked in the annals of Wales with Basset, for the Bassets of Beaupré figured largely in the history of Glamorgan. The first of the family to enter Glamorgan was John Basset, the younger son of one of William the Conqueror's generals. He came as an esquire of the body to Robert Fitzhamon, and acted as his deputy. His great-grandson, Sir Philip, was the first to settle at Beaupré. Hoary tradition says he married the heiress of the Litsillys of Beaupré, a family better known as the Cecils of Burleigh. In course of years the Bassets of Beaupré intermarried with their neighbours, and, like other Norman families, by adding Welsh blood became Welsh in spirit and sentiment, as they were also Welsh in tongue.

Mention has already been made of the inner porch, built in the days of Queen Elizabeth. This is commonly attributed to the first great Welsh artist of the Renaissance, Gwilym Twrch, of Sutton, near Bridgend. Mr. Alexander, in speaking of that artist, said it was to "Old Iolo" all the scanty knowledge of him is due. Gwilym Twrch and his brother Richard were young country stonemasons who had a quarry at Sutton, and found employment in repairing the churches after the ravages of the Reformation. The two men both fell in love with a Coity maid named Gladys. Gwilym was rejected, and so, according to the account, with his tools on his back he quitted Glamorgan to see the world. In his wanderings he reached Rome. After years spent in the Eternal City Gwilym longed once more for his home. He came back with honour and was engaged by Richard Basset to build the present remarkable gateway. The story is that there had been just before a quarrel in the Basset family, and that this gateway was a memorial of the reconciliation. On the front, in six compartments, are the arms of Basset, De la Bear, Tuberville, De Clare, Griffiths, and Morgan. Below is the following curious inscription, in three rectangular labels:

> Say cowdst thou ever fynde or
> Ever heare or see: Wordly
> Wretche or coward prove
> A faythfull frynde to bee.
> Rycharde Bassett having
> To wyf Katherine dowghter
> To Sir Thomas Juon, Knight
> Bwylt the Porch with the
> tonnes in Anno 1600
> His yeres 55, His wife 55.

In 1681 Colonel Sir Richard Basset, a great Welsh nationalist, called the bards of Glamorgan together, and, at the subsequent famous Gorsedd and Eisteddfod of Beaupré, all the rules of bardism and the metres of Welsh poetry were revised. After Sir Richard came his son Philip, who was the last of the old line to live at Beaupré, which was deserted by the family in 1715. After changing hands several times it was purchased by Mr. Daniel Jones, the first of the great local philanthropists. When he died in 1841, without heirs, it was found he had bequeathed the Beaupré estates to Captain Richard Basset, a great-grandson of the Philip Basset just mentioned. So once more there was a Basset at Beaupré, as there had been for seven hundred years before.

The party remounted and drove to Cowbridge for tea and the railway station. In the year 1091 the town was surrounded with a stone wall by Robert de St. Quintin. Part of this, with its simple gateway, remains on the south. The Grammar School (which was holding its prize-day) was endowed by Sir Leoline Jenkins, judge, and Secretary of State in the reign of Charles II.

(To be continued.)

ILLUSTRATIONS.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR.

We continue this week our series of illustrations of these buildings, of which Mr. Henry T. Hare, F.R.I.B.A., is the architect.

CATHEDRAL SERIES: ELY.—CHOIR TRIFORIUM.

We give this week two views of the triforium of the choir in our series on Ely Cathedral.

THE ROYAL SANITARY INSTITUTE.

At the sitting of the Engineering and Architectural Section of the Royal Sanitary Institute Congress at Belfast on July 26, papers were read by Mr. Chas. Brownridge, M.Inst.C.E., Borough Engineer and Surveyor, Birkenhead (Fellow), on "Town Planning of a Modern City from an Engineer's Point of View," in which he said:—

Much credit is due to the small band of earnest municipal reformers who, by persistent advocacy, were the chief means of calling public attention to the great waste taking place in our large growing communities owing to the want of systematic method in carrying on town extensions, and educating public opinion as to the need of legislation dealing with the subject, the outcome of which was the Town Planning clauses contained in the 1909 Act.

In considering how best to deal with the planning of our modern towns and cities every opportunity should be taken of studying existing examples of town planning to be met with both in the British Dominions and on the Continent, with a view to learning "what to do" and "what not to do."

Private enterprise has supplied a number of excellent examples of garden city and garden suburb planning, but the conditions existing in such examples, while teaching many excellent lessons, differ very materially from those met with on the immediate confines of our great industrial communities. In the former, as at Letchworth, &c., large areas of purely agricultural land have been acquired, and a complete town laid out and developed, having regard to all the accepted principles of modern town planning, but in dealing with the extensions to large towns existing conditions must play a large part in moulding our schemes; and whereas in the entirely new city factories and workshops, as well as the civic centre, can be placed where desired, in the case of most modern industrial towns the civic centre and the industrial district are already defined. In many instances the latter, not in positions which would be chosen if the district was being newly planned, are too often concentrated towards the centre of the area, and frequently when extensions to factories or works take place the land required is obtained by the absorption of the site of adjoining dwelling-houses, with a consequence that the housing difficulties are much aggravated, and the price of land forming the outer fringe of the town unduly inflated.

Many people advocate the advisability of taking workpeople to live further out into the country. If factories and workshops are placed in the suburbs this would be a feasible suggestion, but the ordinary industrial worker usually desires to live within reasonable distance of his work, and in the writer's opinion this is an arrangement that should be fostered rather than deprecated, as it enables the breadwinner within the limited time allowed to go home for meals, and thus ensures that the housewife prepares a proper midday meal, which is of material advantage to the children of the household. This does not always obtain where the head of the family has to take his meals with him to work. Where the manufacturer, as at Port Sunlight, Bournville, Earswick, &c., takes his factory or works some short distance out of town, and in conjunction with the manufactory or works deals with the housing of his workpeople, an ideal condition is achieved; but as existing conditions will in most cases for many important and evident reasons have to be accepted, it must be our duty, while doing what is possible to ameliorate and reduce any disadvantages arising from such existing conditions, to so plan and extend our towns as to obtain from the powers available every advantage from a health, housing, and sanitary point of view, and it is on the various points necessary to attain this result that those having to deal with the question of town extension and town planning will have to concentrate their serious attention and energy.

Mr. J. A. Brodie, M.I.C.E., City Engineer of Liverpool, at a sessional meeting of the Institute at Liverpool, described at some length the excellent work which has been carried out by him in that city, chiefly under the powers of a special Act obtained in 1908, to which some reference will be made later, and excellent work has been also done in this direction in many other towns and cities.

It may not be generally known that the townships of Birkenhead and Claughton, forming a portion of the Borough of Birkenhead, offer an excellent illustration of town planning.

The inhabitants of these two townships are now deriving great benefit from the excellent foresight of the Commissioners in planning and providing a number of wide and commodious roads, but the experience gained and the lessons to be learned from this example offer some notes of warning that may be interesting to study.

The cost of constructing wide roads appears for some time to have materially affected and raised the price of building land, with a consequence that building operations were somewhat retarded, and houses were in parts of the area unduly crowded together, and a revision of the Building By-laws and Acts applicable to the district was ultimately found necessary. For many years, owing to the length of formed street and the amount of undeveloped building land, the district was facetiously termed the "city of the future."

There is some difference of opinion as to whether the Town Planning Act is adequate and sufficiently ample to effect the purpose for which it was intended, but until some effort has been made to apply and test the Act it is not possible to make any definite assertion on this point, and, instead of jibbing at the start, it would be fairer (to use a sporting phrase) to "face the hurdles and run the course"; and if obstacles are met which cannot be surmounted, steps taken to educate and direct public opinion in such a manner that the necessary amendments or additions can be provided, and a proper way found to fully obtain all the advantages intended to be provided by the Act.

With regard to the extent of a district for which a town plan should be prepared, various suggestions have been made to the effect that probable development for twenty to thirty years should be provided for, but naturally this will greatly depend on local conditions. Whatever the extent decided upon, the scheme should be so designed and arranged as to form part of a scheme of practically illimitable extent, in order that if a further belt of land has at a later date to be planned, this additional area will work in and adapt itself to the portion already executed. Some authorities advocate the preparation of a plan for the complete laying-out or development of an area including not only the main and secondary roads, but the detailed planning of all the land included in the scheme; whilst others (amongst whom is the writer) prefer that the scheme should provide for the laying-out or planning of the main lines of communication, both direct and transverse, leaving the detailed filling-in or development of the land between to be carried out by private enterprise. This latter method will be the one most generally adopted, as it would not appear fair to bind the landowner (possibly some considerable time before he is prepared to develop his estate for building purposes) to a specific detailed scheme. This arrangement would also leave some scope for the initiative of the architect and surveyor, to whose domain this work properly belongs, and possibly prevent a monotony of type in estate planning. The local authority should, however, take powers to have full and effective control to ensure that the arrangements suitably conform to the general scheme, and that the means of intercommunication are satisfactory and ample.

It is not possible to make one special system of planning applicable to all districts, as the physical condition and the configuration of the land, together with local conditions and, possibly, drainage considerations, will materially influence the general planning of a district; and different areas within the same district may require different treatment.

In preparing the scheme it would be advisable to be ambitious and look well ahead, keeping in mind the fact that "construction" is more satisfactory and cheaper in the end than "reconstruction," and in preparing any scheme good, sound common sense, associated with all the assistance that practical knowledge and science can supply, should be exercised. The scheme should be clothed with all the lines of beauty and ornament that art, artist, or nature can suggest, and all the advice and assistance possible should be obtained from those capable of rendering it, in order that the scheme, when completed, may be the best that can be devised, both from a practical and artistic standpoint, and it should take into account all means of transportation, both by land and water, utilisation of water frontages, &c., and the allocation of land for recreation grounds, playgrounds, parks, sites for schools, baths, allotments, &c. Playgrounds for children should be fairly frequent and convenient to the areas to be served, but there does not appear to be any great objection to recreation grounds or playing fields for seniors being some moderate and reasonable distance away.

In considering both the improvement of existing and the planning of new areas, adequate means of access to railway stations should be provided. There is much to be said in favour of the Continental argument, that the railway stations, being the principal approach to a town, should be suitably designed and placed.

Railway companies might also be urged to pay some little attention to beautifying their stations and approaches in industrial areas similar to that frequently adopted with success at a number of suburban stations. The desirability of providing additional station facilities for suburban traffic must be borne in mind, and if distributing centres for goods were opened in conjunction with certain of these suburban stations it would materially reduce traffic congestion in the central area.

For the purpose of preserving records for future reference, photographs should be taken of old houses, old lanes, or characteristic features which will be transformed or altered by the scheme.

The question of dealing with, improving, and extending the existing main roads leading through the town, from town to town, or from the centre of the town into the country, and providing ample cross communication roads, will require careful consideration.

The writer knows of streets in several towns which, after having been widened at great expense, have had at a later date to be further widened, and, in certain instances, surplus land sold after carrying out the first improvement purchased back by the local authority at a greatly enhanced value.

It might be advisable in certain instances, in order to obtain a more direct route or avoid acquisition of expensive property, to design entirely new roads. In this case regard should be had to sewers, mains, and cables if it is proposed to entirely supersede the old road, and it would be desirable that certain of the roads be of extra width (say not less than 150 feet wide) arranged as promenade as well as traffic streets.

The provision of good wide boulevard or promenade streets furnishes facilities for recreation and exercise, and meets the requirements of a class who do not frequent public parks; and it would no doubt to a certain extent relieve the latter and make them available to their full extent for playing and recreation grounds, and enable them to be utilised as such rather than have them as extensively-planted and expensively-maintained ornamental parks, in which the most important and frequent notice appears to be "Keep off the grass."

Certain main roads should be multiple track roads, in order to provide facilities for slow and fast traffic, and in certain cases special routes for tramways provided, so that the track might be laid without the expensive underbed and paving necessary when laid in the carriage-way, but it is possible that the trackless tramway system may in future be adopted on many routes. The intersection of main roads should be arranged and planned to facilitate traffic, and any natural or artistic feature incorporated in the scheme.

The distance apart of main arterial and transverse roads will depend on local conditions, but should not in any case exceed one mile.

At a recent town-planning conference, held under the auspices of the National Housing and Town Planning Council, it was decided as advisable to ask for main arterial roads to be 80 ft. wide, and that the road-works on 50 ft. of this width to be made at the expense of the owners. It was further suggested that in secondary roads a width of not less than 50 ft. should be provided between buildings. These widths, however, would in special cases be materially increased, and it is possible that the financial terms outlined in these recommendations may not be obtained; but as we are advised that local authorities should endeavour to secure definite agreements with any person who may be affected by the proposals, the recommendations referred to could form a basis of negotiation with the owners.

In Birkenhead a considerable length of secondary roads, 60 ft. wide, have been constructed, in which the estate owner has given land for the full width, and generally paid for street works equivalent to those for a 36-feet street, the remaining cost being paid by the Corporation. In these roads 18 feet of the width is gravelled, and may be added to the footway or carriageway, as future requirements demand.

In dealing with the extent and character of the road works, it may not be necessary to proceed for some time with the construction of some roads, but, having got their lines prescribed under the Act, the works might be proceeded with from time to time as found necessary; and to reduce the cost of street works, whilst ensuring that ample space is provided between buildings, some portion of the width of the road might be planted with shrubs, or formed with grass, gravel, or tar asphalte. In planting trees (which the writer presupposes will be placed in most, if not all, of the proposed roads) care should be taken that they will not require to be disturbed when the carriageway is widened.

It is often suggested that street works should be materially cheapened so as to facilitate building operations. The writer agrees with proposals in this direction so far as they deal with the area of the carriageway or surface to be made; and not with the quality of the material or work to be used in constructing the roads; as, where streets are provided for vehicular traffic, no limitation can be placed upon the weights carried by vehicles; and if the street works are not satisfactory expensive reconstruction or expensive upkeep will ultimately devolve upon the community.

It is interesting to note that in many of the garden villages where kerbs and impervious surfaces to the footpaths were not laid in the first instance these have since in many of the streets had to be provided owing to experience demonstrating their necessity.

It is also advocated that non-traffic streets of narrow width and short *culs-de-sac* might be constructed. In considering this question, it should not be forgotten that districts which are of a rural or semi-rural character at the present time will in a few years become urban, and all roads should be carefully designed, having regard to this fact, and to the adequate police supervision and lighting, so that women and children may at all reasonable hours safely traverse them.

Building by-laws and their operation are closely associated with the administration of the Act, and it is to be regretted that by-laws are not more elastic in their interpretations. A 9-inch wall constructed of good hard bricks laid in hydraulic mortar is much more satisfactory than a 14-inch wall built of imperfectly-burnt bricks in fat lime mortar; but by-laws make no provisions for such facts, and it would be advisable on public grounds if building by-laws could be simplified and revised so as to operate more stringently against the jerry builder, and give some little advantage to the conscientious and sound builder.

Some standard generally applicable to districts should be introduced, in order to remove some of the anomalies now existing, buildings on the immediate outskirts of urban districts in many instances being erected under more lax by-laws than apply to those erected within the urban area. If by-laws are too stringent they should be modified, if too lax they should be strengthened; but so far as they apply to quality of construction they should be uniform.

The limitation of areas for special purposes, the restrictions to be placed upon the land as to the number of houses per acre to be erected, the defining of shop or trading areas, as well as areas upon which the erection of factories, warehouses, or workshops are to be permitted, are matters calling for careful thought and consideration.

The limiting of shops to certain centres and certain streets would materially add to the brightness of shopping centres, and it would appear advisable to rather limit specific areas for the erection of dwelling-houses than allocate specific areas for the erection solely of manufactories and workshops; otherwise it might possibly prevent an enterprising manufacturer erecting in the immediate vicinity of his works suitable dwellings for his workpeople.

Deciding the number of houses to be erected per acre, and possibly the number of storeys or height of buildings, are questions calling for much thought and consideration. If the number is unduly restricted, it might possibly limit the erection of self-contained houses, and encourage the erection of tenement houses with all their disadvantages; and it is advisable that this subject should be dealt with in a fair-minded and liberal spirit, keeping in mind the fact that land on the immediate outskirts of our industrial areas frequently changes hands at a price bordering upon £1,000 per acre before a street is laid out.

Thirty-eight houses per acre (including sites of streets), of a rental varying from 6*s*. 6*d*. to 10*s*. 6*d*. per week clear of taxes (with rates at 7*s*. 2*d*. in the £, and 1*s*. in the £ for water rate), have been erected in Birkenhead under the provisions of by-laws based upon the model by laws.

It must be admitted that areas so developed are too crowded and congested, and if not more than twenty houses per acre were permitted this would give approximately one hundred persons per acre and be reasonable for suburban districts; while the number per acre in the more rural districts might possibly be further reduced to ensure adequate allocation of land for the purpose of open spaces, playing-grounds, allotments, &c.

It is frequently advocated that every house should be provided with a large garden. Until it is assured that all occupiers are prepared to properly utilise and keep in order such gardens, it will be preferable, while providing a number of houses with gardens attached, to erect property with gardens which are communally or publicly maintained.

Stringent by-laws or regulations will be required to prevent yards and gardens being used as poultry-runs or for undesirable purposes. In districts where land will usually be developed by builders whose interest in the property erected ceases when a sale is effected, inconvenience may arise unless some control over these matters is retained by the governing authority: and, while ensuring the provision of adequate space in connection with buildings, it would appear to be desirable that additional garden accommodation or open space should be provided in the shape of allotment gardens reasonably adjacent to the houses.

In most of the garden suburbs considerable power appears to be retained by the authorities under whose direction the areas have been developed in regard to the utilisation and maintenance of the gardens and open spaces.

The question of redevelopment is an important one, and gives difficulty in all rapidly-growing areas. Cases arise of districts in which large houses erected in ample grounds, and let at rents bordering upon £120 per annum, are passing through a transition stage, the tenants leaving the district for the outskirts or the country. Circumstances arise compelling certain of the owners to realise their property at a much-depreciated price, and the property in many instances passes into the hands of speculative builders. The land not being stringently restricted, the parties acquiring the property pull down the existing houses with a view to erecting rows or terraces of small houses, which, while complying with the by-laws, depreciate adjoining large houses, and generally affect the amenity of the district. The ultimate redevelopment of the district is simply a matter of time, and the question calls for careful consideration in regard to the best manner of bringing about the inevitable change so as to inflict the least hardship on the adjacent owners who are not prepared to immediately participate in the redevelopment of their area, and it would be desirable in this work to apply as far as possible all existing powers for the retention of air space, buildings over forecourts, areas, &c.

The estimated cost of any scheme will be somewhat difficult to accurately prepare until some experience has been gained as to the possible interpretation to be placed on the various clauses by the arbitrators or valuers to be appointed by the Local Government Board, and how the cost of road works has to be borne; but in connection with this point it should be borne in mind that no compensation is payable in connection with the provisions inserted in the scheme, which prescribe: The space about buildings limits the number of buildings to be erected, or prescribe the height or character of buildings which the Local Government Board consider reasonable.

It will be advisable, therefore, to fully consult the Board on these points, and if compensation is not to be paid respecting these matters, conform to their requirements. Actual experience on these points will no doubt shortly be available, as a number of schemes are in active preparation, and the necessary formalities required by the Act are in process of practical application.

Much of the immediate expense of a scheme will no doubt fall upon the larger authorities as the responsible authority under the Act, as they will usually be the parties initiating it; the pressing need of providing for the future having generally been brought home to the larger communities by the necessity of spending large sums of money on street improvements, widenings, and redevelopments within their area.

It is frequently stated that town planning proposals necessitate spending money entirely for the benefit of future generations. Reasonable and judicious expenditure upon necessary town improvements and town planning schemes is a sound business proposition, and all improvements, of whatever nature, are practically for future benefit. It is only epitaphs, obituary notices, and vain regrets that are for the past; our care is and should be for the present and future.

Owing to want of foresight in the past many of our great industrial communities have been put to considerable expense. It is stated that in the city of Leeds, which is now engaged in carrying out a large improvement and redevelopment scheme within the city, the cost of the work has added 1s. to the rates, and this would appear to show that prevention would be better than cure.

The subject of town planning has at all times received the careful consideration of the borough engineer and surveyor, who, owing to his position and technical training, has been frequently required to suggest schemes of improvement, in addition to advising upon the various proposals for estate developments carried out within his district. The powers conferred upon local authorities have, however, in the past been too limited to deal with the development of towns in a thorough and comprehensive way. The Act of 1909 offers some hope that this state of affairs will in the future be remedied, and is generally welcomed and will be willingly administered by the profession to which the author has the honour to belong.

In submitting these notes for the purpose of discussion the writer would suggest the following special points for the intercommunication of views and elucidation of opinion—viz.:

1. The extent of district advisable to be included in a scheme.
2. The desirability or otherwise of conjointly with a town planning scheme carrying out a scheme of street improvement, possibly combined with a housing scheme.
3. The width and character and distance apart of (*a*) main radial roads, (*b*) main ring or cross roads.
4. The degree to which it is advisable to relax: (*a*) by-laws respecting the construction of new streets, (*b*) by-laws respecting the construction of new buildings.
5. The number of houses to be erected per acre; the limitation of areas for special purposes and how this can be best applied; and the formation of shopping centres.
6. How best to deal with the redevelopment of areas.
7. The extent of provision to be made for parks, recreation grounds, open spaces, gardens, school sites, and public buildings.

In conclusion it might be pointed out that while all engaged in municipal government work are being educated up to a proper standard in regard to this matter, the education or training of the individual citizen should be borne in mind, and efforts made to inculcate in him a proper standard of personal responsibility so that he may appreciate and properly apply the benefits to be derived from the Act.

Mr. James Munce, M.Inst.C.E., then read his "Notes on how a town has succeeded without the Town Planning Act," in which he gave a historical sketch of the municipal development of the city of Belfast, and the various steps taken by its rulers for the improvement of its town planning.

The following discussion on these papers then took place:

Mr. R. Welch said he thought they had suffered in Belfast from the fact that the town was planned on Scotch rather than English lines, for it would be noticed that the houses had not a very liberal supply of garden. In county Cork and other places they found most delightful towns which were built on the English system, but in Belfast they found straight streets, and the houses built up to the roadway, and nowhere for the children to play except in the roadway. The Scotch idea was a small house. It was thrifty and economical, but there was no idea of what they might call the refinements of life. The English, on the other hand, had an idea of the refinements of life, and they had their gardens, and so on. In Lancashire, he was sorry to say, they had got away from the English idea.

Mr. Luke M. Hill (George Town, British Guiana) said he must express his appreciation of Mr. Munce's paper in regard to the improvements at Belfast. When he left Belfast the population was only about 175,000, but it had now increased to nearly 400,000. When he arrived here a few weeks ago he went about to see the alterations since he lived here forty years ago, but although the roads were still there they had been built up to, and had gone entirely out of his remembrance. He had been engineer of George Town for thirty-two years, during which time he had laid out four new districts, containing about twenty miles of streets. Their streets there were all laid out rectangular, which, although monotonous, was convenient. None of the streets laid out under his supervision were less than sixty feet wide, and many were 100 feet. They had difficulties to contend with there in the fact that the average level of the streets was 4½ feet under sea-level, so that they had to make a large provision for the rainfall by canals and reservoirs, which was then discharged into the river by means of sluices. The canals were arranged either down the centre or by the sides of the streets, and when he referred to the width of the streets as 60 feet, this was exclusive of the canals, and in some streets, where the canals were down the centre, they were 130 feet wide. The reservoirs which were not used for drainage purposes were planted with aquatic plants, which added much beauty to the town. He had made a point of going in for street planning, and it had helped to give the city the name of the Garden City of the West Indies. Unfortunately, during his recent visit to the West Indies, Sir Rupert Boyce called at George Town, and he said their street planning would tend to harbour mosquitos. He had rather a hard fight to keep the trees he had been planting for the last thirty years.

Mr. S. Brodie (Blackpool) said in many respects Birkenhead was an ideal town, and therefore Mr. Brownridge had brought before them a counsel of perfection. They had an ideal state of things in regard to the width of the roads there which he was afraid few of them could hope to attain to. Mr. Munce had entitled his paper "Notes on how a town succeeded without the Town Planning Act," but he had referred to about half a dozen local Acts which did not cease to be town planning Acts merely because they were local Acts. They would all agree that Belfast was extremely well laid out. In one case at Blackpool they had widened a road from 22 feet to 60 feet, and by the sale of surplus land he had been enabled to carry out the improvement and put down a main sewer without costing the ratepayers a penny.

Mr. W. Whitaker said that the discussion had all been on the side of the authors, but he would like to say something about the fetish of broad and straight roads, and would give an example of a town which owed a great deal of its beauty to not having its roads either broad or straight—he referred to London. He considered that many of the beauties of London would be spoilt if they had too much widening or straightening of streets. Was there a street with better shops than Bond Street? and yet that street was not 50 feet wide in any place. It was a great deal easier to cross a road 50 feet wide than one 100 feet wide. He liked always to see both sides of a question and also to see shops on both sides of a street without the risk of being run over. For main lines of communication they wanted broad streets, but he hoped they would not consider that every street was to be not less than 50 feet wide, for if they did they would run the chance of a city being made frightfully monotonous and confoundedly ugly. In the town in which he lived—Croydon—he was glad to say that, owing to the assistance of Mr. Burns, they had gloriously defeated the Corporation on the question of a road-widening, and saved a quaint old building.

Mr. C. Brownridge said every engineer would agree with Mr. Whitaker, for they did not want to destroy anything of a picturesque or historical nature. On the other hand, they wished to preserve every feature of that kind. They must admit that a narrow street gave more facilities for shopping than a wide one, and he had pointed out the necessity for shopping centres. It was all very well to point to isolated instances of inexpensive street-widening, but they had to admit that there were many improvements which cost them a lot of money. There were those who advocated the taking of land, but piracy on the high seas had been stopped for many years, and he did not see why it should now be brought to land. They must be prepared to act as honest men, and pay for what they wanted.

Mr. Munce said that the property-owners of Belfast assisted them in making wide streets. They did not attempt to make wide roads or take down old buildings, as anyone would see who rode round the town. What they really wanted was to see the houses set back from the roadway, so as to get the space rather than that the roads themselves should be too wide.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

THE question of establishing the examination required by Clause 2 of the Supplemental Charter to be passed by Licentiates who being otherwise qualified desire to be admitted to Fellowship of the Institute has been for some time under consideration by the Council. The matter having been referred to the Board of Architectural Education, a scheme has been drawn up which has received the approval of the Council, and arrangements are in progress for holding an examination at an early date.

The candidate will be required to submit for the approval of the Council working drawings of one or more of his executed buildings, which may be supplemented by photographs thereof, and by original sketches or measured drawings of actual work. Should the work so submitted be, in the opinion of the Council, of sufficient merit, the candidate may be exempted from any further examination. Should the work so submitted be, in the opinion of the Council, inadequate, his application will not be further entertained. If the drawings submitted are approved by the Council, the candidate will be required to submit himself to an examination which will be held on the premises of the Royal Institute of British Architects, or elsewhere, as may be appointed by the Council of the Royal Institute.

Ten days before the examination is held a list of subjects will be issued to all candidates, and from this list each candidate will be required to select one subject, and to announce to the Secretary of the Royal Institute, five days before the examination, which subject he selects. When the candidate attends at the appointed place of examination, he will be furnished with particulars of the selected subject, and he will have to prepare a set of working drawings of the subject, and such details as may be required, together with full descriptive notes. The candidate will also be required to write a short paper or report on a subject previously selected by himself and approved by the Council. Four days will be allowed for the examination, and the candidate may be required, at the option of the Council, to attend subsequently for an oral examination on his papers. Candidates must provide their own drawing-boards and instruments. The fee for the examination will be six guineas, which sum must be sent to the Secretary, R.I.B.A., with the candidate's announcement of the subject which he selects. If the candidate fails to pass the examination the fee will not be returned to him, but he will be allowed to sit for one subsequent examination without payment of any further fee.

Should a candidate be admitted and pass, he will be qualified, subject to Section 8 of the Charter, for candidature as Fellow.

Should a candidate not be passed by the Council he will be informed of the fact, but the names of unsuccessful candidates will not be announced or published.

THE SUMMER EXAMINATIONS.

The Preliminary.

The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., was held in London and provincial centres on June 12 and 13. Of the 146 candidates admitted, claims for exemption from sitting were allowed to the number of forty-four, and the remaining 102 candidates were examined.

The passed candidates, with those exempted—125 altogether—are as follows:—

Mohamed Afify, James Taylor Aldred, Harold Campbell Ashenden, Charles Herbert Aslin, Percy Armitage Astley, Clifford Gerald Backhouse, Bruce William Seymour Stiles Baily, Herbert Donald Baldwin, Walter Baldwin, Horace Beaverstock, William Walter Begley, Noel John Byron Bell, Kenneth John Bonser, Roy Bowes, William Braid, Joseph Bridge, Rowland Egerton Brinckman, Edward Hallett Bucknole, Joseph William Bull, Harold Burleigh, Edgar Burnett, Dudley James McPherson Burton, Stanley Howe Byrt, Gareth Wilfred Capes, Cyril Cliff Cheek, Christopher Christie, Albert Rowland Clough, Ernest Clough, Robert McDowall Fothergill Cooke, Frank Douglas Cooper, Gerald Linford Crouch, Idris Davies, Charles Derry, Richard Dobson, William Doddington, John Edwardes-Evans, Eric Ewart Evans, Thomas Cwmanne Evans, Graham Tom Eveleigh, John Camplin Farrer, William Ernest Foale, Thomas Forster, Robert Frater, Nelson Fyfe, John Gorbell Goodyear, Wilfrid Bernard Gostling, Robert McGregor Graham, Wm. Stanley Grice, Edgar Rees Griffiths, Wm. Geo. Gush, Daniel Carby Hall, Chas. Alfd. Harding, Eric James Hatherell, Arthur Jas. Hayton, Geo. Leslie Head, Leonard Heywood, Stanley Honour, Roland Cantis Horsley, Hussein Izzy, Harold Edgar Jarvis, Frederick George Hayes Jenkins, Charles Frederick Jones, Ieuan Roland Jones, Robert David Jones, Westbury Lloyd Jones, Lewis John, Cecil Herbert Langdale Kelham, Norman Kelley, Frederick Henry Lambert, Cecil Walter Langlands, Robert Tattersall Lapierre, Joseph Frank Lawson, William Armitage Ledgard, Harold Alfred Lister, Albert Lloyd, James Logan, Ernest Cecil Lomer, Sidney Harold Loweth, John Gordon McBeath, Robert Norman Houghton MacKellar, Gilbert Marshall MacKenzie, Malcolm Munro MacPherson, George Andrew Marshall, Robert Arthur Mather, John Nelson Meredith, William Alexander Morris, Alan Lee Mortimer, Donald John Moss, Thomas Whitfield Moss, Bernard Newboult, Joe Normanton, William Richard Owens, William Gordon Parkin, Leslie Horton Partridge, Francis Burlinson Percival, Robert William Pickin, James Radcliffe, Cyril Bland Radnor, Vasant Raghunath, Frederick William Rees, Edmund Arthur Reeve, Ernest Claude Ridge, Edwin Frederick Rolfe, George Alfred Rose,, Edward Gilbert Rowntree, John Newton Rutherford, Lester Howard Sacré, John Leigh Percy Sace, Percy C. Schulke, Percy Skelding, Foster Rowland Stobbart, Ernest Tudor Stythe, Joseph Cedric Swallow, Martin Bartley Taylor, Richard Thorburn, jun., Gilbert John Trigg, William Maurice Tripp, George Oswald Venn, Adrian Waterlow, Stephen Grylls Wilson, Goodman George Winebaum, Edmund Percy Wingrove, James Gerald Worth, Sydney Wright, Laurence Muskett Yetts, B.A. Cantab.

The Intermediate.

The Intermediate Examination, qualifying for registration as Student R.I.B.A., was held on June 12, 13, 15, and 16; 127 candidates were examined.

The passed candidates, given in order of merit as placed by the Board of Examiners, are as follows:—

William Park, Thomas Alexander Page, John Ewart March, John Bredel Matthews, Benjamin Donaldson, James Andrew Clarke, Robert Wemyss Ferguson, Philip Dennis Bennett, Philip Humphry Wyatt, Thomas Henry Chalkley, Reginald Wilcox Lone, Harold Crone, Clifford Wigg Craske, Leslie Youngman Harris, Collings William Brown, Allan Lionel Freaker, Robert McLachlan, Harold Albert Thomerson, Stanley Howe Fisher, James Edward Marchinton, John Henry Odom, William Holden, Frederic Bertram Last, Francis Clemes, Rees Phillips, William Harold Price, Denis Henry Walker, William Allison, Judah Weinberg, Robert Maclaren Love, William London Semple, Ernest Willson, Andrew Stuart Burnett, Howard Moir Archibald, William Arthur Banks, Norman Spencer Benison, Guy Bramwell, Thomas Hargreave Broomhall, Charles Norman Chard, William Wilmot Thorne Chine, Thomas Stapledon Copplestone, Lancelot Ralph Gawen Errington, Eric Carwardine Francis, William Hubert Godwin, Joseph Garnet Hands, Ernest James Hickman, Trevellyn P. Jenkins, Godfrey Horton Ledger, Theodore Ellis Legg, Samuel Douglas Meadows, Harold Edward Moore, Cyril Savage Morley, Cuthbert Edward Newton, Rashbehari Nandi, Bernard George Norton, William Edward Wallis Terrell, Geoffrey Ronald Gilbertson Topham, Arthur Eric Townley, Roland Keith Young.

Colonial Examination.

The following candidate passed the Intermediate Examination held in Sydney in January last, viz.:—

Gordon Samuel Keesing.

Exemptions from the Intermediate Examination.

The following Probationers, possessing the qualifications required by the regulations, have been exempted from sitting for the Intermediate Examination, and have been admitted as Students R.I.B.A.:—

Percy Joyce Adams, Percy Maguire Andrews, Guy Maxwell Aylwin, Nasserwanji Mancherji Merwanji Bhownaggree, Douglas Morley Griffin, Charles Alfred Harding, Harold Edward Moss, William Richard Owens, Ivor Mervyn Pritchard.

The Final and Special.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 29 till July 7. Of the 136 candidates examined, 59 passed, and the remaining 77 were relegated to their studies. The passed candidates are as follows—the † prefixed to a name signifying that the candidate entered for the Special Examination, which is designed for architects in practice and chief assistants exempted by the Council from the Preliminary and Intermediate Examinations and from submitting Testimonies of Study:—

Maurice Spencer Rowe Adams, Laurence Mortimer Angus, M.A., †Edward Ernest Barks, †Paget Logan Baxter, Hubert Joseph Benians, William Thomas Benslyn, John Archibald Bessant, Richard Henry Percy Bevis, Arthur George Blackford, Kenneth Stephen Broad, Baldwin Brown, Murray Brown, John Edgar Bullock, Leonard Harris Clarke, Joseph Charles Gladstone Davies, William Frederick Davies, †Charles Davis, †Charles Alva Edeson, Arthur Frederic Evans, Leonard John Finning, Wilfred Thomas Garbutt, Bernard Malcolm Goodwin, Wilfred S. Gorringe, Guy Donne Gordon Hake, Charles Alfred Harding, Geoffrey Wyville Home, Thomas Cecil Howitt, John Norman Keasley, Frank Wardel Knight, Wilfrid Lawson, Adrien Denis Leroy, Philip Norman Logan, Charles William Long, William Lucas, Moritz Richard Martin, Frederick Edward Mennie, †Harold Ian Merriman, Alfred Hugh Mottram, George Burgoyne Owen, Thomas Abel Parker, John Wilson Paterson, Ivor Mervyn Pritchard, Hayward Lewis Samson, Bernard Wardlow Habershon Scott, Charles Malcolm Swannell, Francis Harold Swindells, Michael John Tapper, Harold Thornton, Arthur George Warnham Tickle, Harry West, †Johannes Thorwaldsen Westbye, Arthur Eli Mitchell Whitehouse, Norman Wigzell, Llewellyn Ebenezer Williams, Allen Woodward Wilson, Cecil Reynolds Winter, Harry Wormald, Christopher Wright, Allan Murray Campbell Young.

(To be concluded.)

CALCULATIONS FOR RETAINING WALLS.

(Continued from last week.)

11.—*The Requirements of Stability.*

In order that the equilibrium of the wall may be stable (*see* paragraph 9) the resistance to overturning must be greater than the overturning power of the wind, or $W \times \frac{t}{2}$ must be greater than $P \times \frac{h}{2}$.

As $\frac{h}{2}$ is fixed then P must be reduced. Fig. 5 is the triangle of forces repeated, a smaller value being taken for $P = bc$. The resultant will now be ac, which, when transferred to fig. 3, will intersect AB in C.

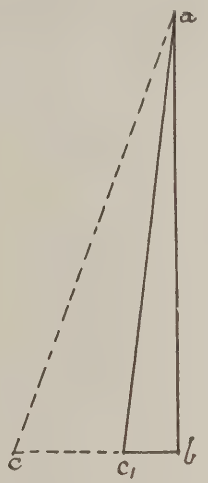

FIG. 5

Fig. 6 represents the joint AB detached for clearness.

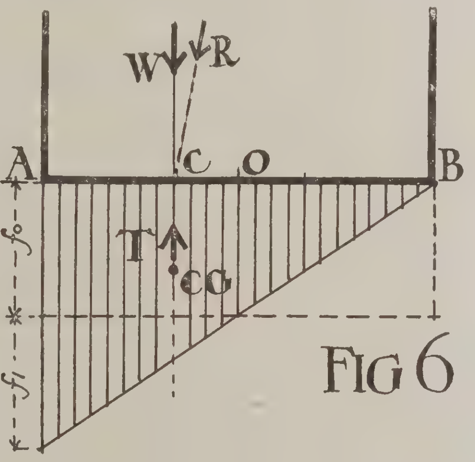

FIG 6

12.—*The Effect of the Resultant.*

The resultant, acting as it does at an inclined angle, will have two effects: it will tend to crush the material, and it will tend to cause the upper part of the joint to slide over the lower part. R must therefore be split up into two forces—one vertical (to cause crushing only) and one horizontal (to cause sliding only).

The two forces are called the vertical and horizontal components of R, and are represented on fig. 5 by ab and bc respectively. As ac could be used in place of ab and bc, the reverse holds good, and we can use in place of R its vertical and horizontal components.

13.—*Failure by Crushing.*

Consider first the vertical component of R. In magnitude this $= ab =$ W. When W acted at O, the centre of the joint, the stress was uniform over the whole joint, and the centre of gravity of the resisting stresses (f_0) was immediately under the point of application of W. (*See* paragraph 5.)

Now that W acts at C the stress cannot be uniform, but the C.G. of the resisting stresses f_0 must be under C.

In the case taken AC $= \frac{1}{3}$ AB, and, seeing that the C.G. of a triangle lies on a line parallel to its base and $\frac{1}{3}$ the vertical height between the base and the apex, then the figure representing the stresses which will have its C.G. below the point C must be a triangle, and its area = total stress = area of stress diagram at fig. 3.

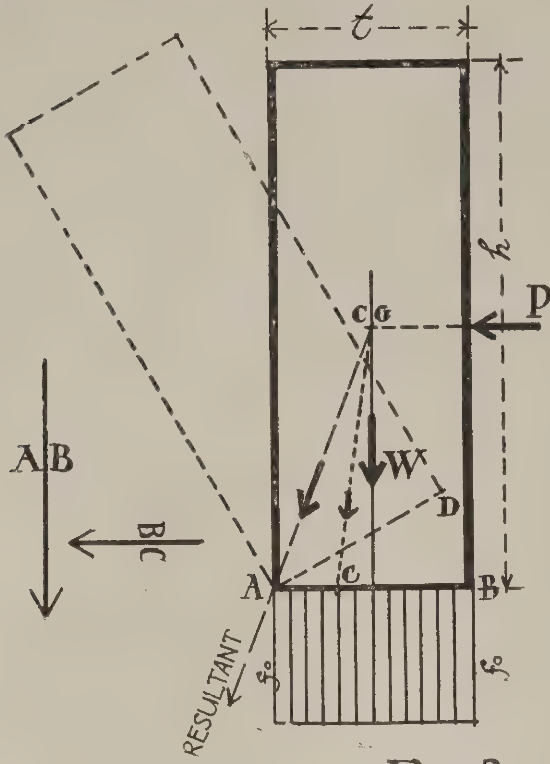

FIG. 3

Then its base must be twice the f_0 found at fig. 3, and the triangle representing the distribution of stresses will be ABD (fig. 6).

A.D. $=2f_0=2\times\frac{1}{2}$ ton $=1$ ton per foot super.

The crushing at A is therefore one ton per square foot, and at B is nil. Notice that at A an additional stress f_1 (in this case equal to f_0) has been added, and at B subtracted from the stress diagram obtained by paragraph 5.

(*To be continued.*)

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE Nottingham Architectural Society selected Windsor Castle and Eton College this year as the places to visit on their annual summer excursion, and a large party of members and friends joined in the outing on July 27. The Society greatly regretted that, owing to family bereavement, the President, Mr. Robert Evans, was unable to join them. The party included Mr. E. R. Sutton, Vice-President; Messrs. A. Marshall, W. V. Betts, W. D. Pratt, W. R. Gleave, F. W. Gregory, R. S. Spencer, W. H. Taylor, S. G. Walker, and the Hon. Secretary, F. M. Royle.

Mr. Nutt, the resident architect of the Castle, kindly met the Society, and personally explained the many interesting architectural features. A visit was first made to the quaint half-timbered horse-shoe cloisters, built by Edward IV., and then the party went over the curfew tower constructed by Henry III., which contains a peal and clock over 300 years old and the famous curfew bell. St. George's Chapel, a magnificent specimen of Perpendicular architecture, was then fully explained. The banners and crowns of King George, Queen Mary, and the Prince of Wales, which have been recently added to the Knights' Chapel, were pointed out. These, with the other helms, crests, and banners, form a very beautiful and impressive example of heraldry.

The royal mews, which cover about four acres, were fully inspected. They contain the semi-State carriages and postillion landaus. Among other interesting objects pointed out were the well-known pony carriage of Queen Victoria and the miniature carriages and broughams of the royal children. The eighty horses in the stables include the beautiful grey and bay carriage and saddle horses, and the little ponies used by the royal children. The pony used by General Cronje in the South African war is also kept at Windsor. Great care is taken of him, which he evidently appreciates by his good temper. The party was then conducted through the State apartments, which contain priceless pictures and magnificent specimens of arms and armour.

A visit was then paid to Eton College, founded in 1440 by Henry VI., originally for twenty-five scholars. It is interesting to note there are now over 1,000. Through the courtesy of the Provost, the Society were shown the school chapel, which contains many beautiful memorials of distinguished Etonians; the quaint old school dining room with its three fireplaces and iron reading desk; and the library, which contains a very valuable collection of old books and documents dating back to the foundation of the college.

The return to Windsor was made through the historical "playing fields of Eton," from which the best views of the Castle can be obtained. Mr. Nutt then conducted the Society through the Albert Memorial Chapel, converted by Queen Victoria into one of the most magnificent memorials ever dedicated to the illustrious dead, and in the crypt of which King Edward the Peacemaker is interred.

During dinner at Windsor a telegram was received from the President, and a reply sent; and the thanks of those present were given to Mr. Spencer, to whose exertions the successful programme of one of the most interesting summer excursions of the Society is due.

Correspondence

Hyde Park Corner.

SIR,—The letter of Mr. Mark H. Judge is well worth consideration, but there is one point I should like to draw special attention to—would the position suggested on the estate bought by Messrs. J. C. Humphreys be a quiet one, for I take it that any question of the removal of St. George's Hospital would very largely depend on the question could a site be found close by, and if so would the terrible noise of street traffic be thereby obviated? Personally, I should be sorry to see St. George's Hospital removed simply because a few pounds might be gained by removal to a side street; but if it is, then better have a good paying hotel than an opera-house nearly always a failure, and I certainly consider that the position would probably tend to such a result.—I am, &c.,

MEDICO.

Politics and a Profession.

SIR,—Which pays best—to be a member of Parliament with a decent salary, or to be a Surveyor, Rate Collector, Water Inspector, Sanitary Inspector, and officer under the Town Planning Act? The cutting is from *The Llangollen Advertiser*, and is interesting as to the "highly-paid official."—Yours truly,

WANDERER.

[The cutting which our correspondent sends refers to the appointment of a Surveyor, Sanitary Inspector, and officer under the Town Planning Act, 1909, at a salary of £100 a year, with liberty to engage also in private practice, for which, however, it was the general opinion of the Councillors that he would have no time to spare when his official duties were discharged.—ED.]

Hampstead Town Hall.

SIR,—Under your heading of "Varieties" in this week's issue *re* foundation-stone laying at above, would you mind mentioning next week that we are the general contractors.

We are also commencing a contract for alterations and new exits and entrance at the Savoy Theatre in the Savoy Hotel Courtyard for Mrs. D'Oyly Carte.—Yours faithfully,

July 28. PATMAN & FOTHERINGHAM, LTD.

King Edward Memorial.

SIR,—Following on your most apposite insertion of my letter to you of July 24, *à propos* the above subject of momentous and artistic interest, I hasten to intimate that in exalted quarters I have been desired to make a complete design in oils anent the tentative crude sketch, and which accompanied my letter, by the 18th prox., with a view that His Majesty may see the same prior to the design in question being taken by the Hon. President of the International Arbitration and Peace Society to Rome, Mons. Felix Moscheles, the same to receive a conspicuous place at the royal instigation of H.M. the King of Italy at the opening of the historical Peace Exhibition, October 15, simultaneously with the opening of the International Geographical Congress within the precincts of Fort St. Angelo, "Mole Adrian," and that His Britannic Majesty may receive the universal criticism thereon by the morning of their Majesties' departure for the Imperial Coronation Delhi Durbar, November 9, the 70th natal anniversary of His Majesty's revered and never-to-be-forgotten father, King Edward VII.—Yours truly,

LIEUT. G. DAVIES, R.N. (retired).

FORTHCOMING EVENTS.

Friday, August 11.

Architectural Association : Forty-second Annual Excursion to Tours and Loire Valley (August 11-20).

Tuesday, August 15.

Manchester Society of Architects : Visit to Messrs. Edward Wood & Co.'s Ironworks, Ordsall Hall.

Saturday, August 19.

Manchester Society of Architects : Visit to Chester Cathedral and Eccleston church (the late G. F. Bodley, architect).

Architectural Association : Excursion of Camera, Sketch, and Debate Club to Holland House.

Thursday, August 31.

Guild of Architects' Assistants : Visit to Victoria Palace, Victoria, S.W. (Messrs. Frank Matcham & Co., architects).

COMPETITION DESIGNS FOR DEPTFORD CENTRAL LIBRARY.

THIS may be taken as a competition of experts, for it has been limited to architects selected by the Council of the Metropolitan Borough of Deptford from amongst architects practising in London who have had more or less experience in the designing of libraries. Hence, as might be expected, there are no bad plans, but some are better than others.

The site for the building is at the corner of Lewisham High Road and a side street, Rokeby Road. It has also access to a right-of-way on the end opposite to the principal frontage. The width at the back is considerably less than at the front, the shape of the site being a trapezium, which really formed the only difficulty for an expert library designer, and one that could not be altogether avoided by axial and rectangular planning with an abandonment of awkward corners, as the requirements of space for the various parts, precisely defined in the Instructions to Competitors, made it necessary to utilise all the space available, and even so most of the competitors found it necessary to avail themselves of the qualifying admission that "the measurements given are those which the Libraries Committee consider desirable, but are approximate only."

Sir A. Brumwell Thomas has been placed first and wins the appointment as architect of the work; Messrs. Castle & Warren receive a premium of thirty guineas; and Mr. H. T. Hare a premium of twenty guineas. The Libraries Committee having expressed their opinion against a corner entrance, there remained for the competitors the choice between placing the principal entrance at one end of the principal frontage or somewhere on the side elevation to Rokeby Road. Sir Brumwell Thomas has adopted the former alternative, and his entrance leads to a direct corridor 12 feet wide, on the side of which are his news room and lending department. These rooms are divided into nave and aisles by a series of piers that, carried up through the first floor, maintain the same disposition in the magazine room, reference library, and reference book store, and enable the centre portions of these roofs to be carried higher than their aisles. The staircase to the first floor is well planned, so that whilst itself "of good appearance," as the instructions request, it is economical in corridor and opens direct to the reference library, magazine room, auxiliary room, and librarian's room. Sir Brumwell's design surpasses all its competitors in the simplicity and directness of its structure. It is an organism and not a fortuitous concourse of parts. Hence it is economical and easy in working. All the principal rooms on the first floor are top-lighted only, which, with the nave and aisle structure, makes for simplicity in the external treatment, and the elevations which are to be carried out in brick and stone are dignified without extravagance. There can be no question that in this competition the design placed first is the best.

Messrs. Castle & Warren have adopted a similar position for their principal entrance to that in the first design, but the irregularity of the site has been allowed to manifest itself in the approach and in the public space of the lending department, which, by the way, has been specified by the Libraries Committee to be on the "indicator" system. The staircase in this design is in a more central position, but this leads to a greater development of corridor on the first floor, as well as to an indirectness of approach on the ground floor. In all the plans the general disposition of the principal rooms follows the instructions of the Libraries Committee. The news room and lending department are on the ground floor, the former along the frontage to Lewisham High Road. The magazine room, with an auxiliary room "contiguous, but not connecting," are placed along the frontage to Lewisham High Road on the first floor, on which floor also are the reference library "contiguous to the magazine room" and the reference book store. With the position of these principal rooms practically fixed, and that of the minor rooms generally indicated, the planning of the competitors has been to some extent restricted, almost the only vital point on which judgment could be exercised being the determination of preference between an entrance in the High Road or the side road.

That this determination was not easy is shown by the fact that Mr. H. T. Hare, with all his experience as a competitor and as an assessor of other men's designs, thought it worth while to submit two sets of drawings, one with the entrance in Lewisham High Road, the other as an "alternative," with the entrance in Rokeby Road. Mr. Hare is too busy nowadays for this sort of game, consequently neither design is worthy of his past achievements, and in our opinion the "alternative" is the better plan of the two. It is only a young man with nothing else to do who can give sufficient time and thought to turn out alternative designs in a competition, each showing his best effort, and even then it is exceptional to find that both are in the front rank amongst the designs submitted in any particular instance.

It is one of the cruellest features of our competition system that a man may make an initial error of judgment in the lay-out of his plan and pile up an immense amount of good work on that false basis. Hence we are strongly in favour of the double-barrel type of competition, with the simplest possible expression of idea in the first essay, so that only those competitors who are on the right lines may spend time and thought in the elaboration of their idea. This Deptford Library competition, we admit, is a case that does not bear out our general view. With the whole of the designs before us, we recognise that there was no great superiority in the preference of the main frontage or the side frontage for the principal entrance, and it would have been possible to have evolved the best design with either alternative. As it happens Sir Brumwell Thomas has produced the best design with the main entrance in Lewisham High Road.

Mr. Hare in his primary design follows Sir Brumwell's choice. He has a good and direct approach to his news room and lending department, but there is waste of space in the latter due to the irregularity of the site. His staircase is a miserable affair, and is not, as the instructions request, "of good appearance." Its arrangement leads also to an excess of unremunerative corridor on the first floor. The elevations are not worthy of the author.

Mr. Arnold S. Taylor submits one of the best of the non-premiated designs with an entrance on the main front. His public space at the side of the lending department, tapering from 4 ft. 6 in. to 15 ft., does not comply with the condition this is "to have clear depth of at least 12 ft. outside counter," though as it expands the right way the defect is not so very serious. His main staircase is centrally placed and economical on the first floor, but the approach at the foot is not quite happy. His elevations are fair, but the extensive use of side lights to the first-floor rooms is a handicap in comparison with Sir Brumwell Thomas's design.

Messrs. Newman & Newman adopt the High Road main entrance, but their plan follows the lines of the site too closely. Their elevations are spoilt by side lighting and a multitude of windows.

Mr. Albert L. Guy has arranged his plan somewhat on the lines of the second premiated design, but it is lacking in directness. The front elevation is passable, but the side conveys the idea of three separate buildings.

Messrs. North & Robin place their entrance in the Rokeby Road, but err in making their public space in lending department a corridor to the news room and to the main staircase. Their elevation is too pretentious.

Mr. Maurice B. Adams covers all the irregular space of the site; thus, although the plan is good with directness of approach and economical staircase as in the winning design, the result is a less shapely building. The elevations suffer from the use of side windows on the first floor, although top light is also provided.

Mr. S. B. Russell sends one of the best designs with Rokeby Road for the main entrance, from which there are steps down to the news room. There is economy in corridor and the elevations are symmetrical, dignified, and restrained in red brick and stone.

Messrs. Eedle & Myers have a good entrance from the Lewisham High Road, with an elaborate stair, but the plan is too much cut up with recesses and alcoves.

Messrs. Young & Horsley use the side road for their main entrance, which, with hall, corridor and stair, cuts off completely the news room from the lending department. The back part, containing minor rooms, is very involved, and would necessitate many girders to carry walls over voids. These gentlemen submit an alternative design with entrance in the main road, which we think is better than their primary one, especially in the symmetrical elevations by which it is accompanied.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

We are pleased to welcome some new participants in the work of the Club, as well as some of our old members in the first month of the new yearly series of competitions for our Travelling Studentship. The subject set for July—an external stone staircase or a flight of steps forming an approach to a building, terrace or courtyard—is one that is well worthy of study, the feature being an important one in the design of many buildings and one that receives great consideration in the work of the best architects of the present day.

"Doric" has measured the terrace stairs at Donibristle, Fife, which are the subject of a fine piece of approach planning and have connected with them some interesting and excellent ironwork. Our contributor has measured his subject very carefully and sends a good perspective sketch, but his drawing leaves something to be desired in firmness and quality of line.

Mr. C. S. Carter has fallen back upon the well-known York Water Gate, London, now stranded far from the river to which it was once the approach. The drawings are fairly complete with plan, elevations, section and full-size details.

"Seleth" has drawn a short flight of steps, with adjacent balustrade leading to the terrace at Woodsome Hall, Huddersfield. The work is seventeenth century and of simple but effective design. The drawings are to a good scale, which lessens the necessity for full-size details, of which the execution and design is hardly worthy. The author's perspective sketch is a little inclined to be woolly.

Mr. E. H. Gibson sends measured drawings and perspective sketch of a good flight of steps at Constable Burton, Yorkshire, and in his sketch, which is rather roughly executed, shows the connection with the entrance of the house, to which the steps are an approach. Some full-size details are useful, but the drawing of the many balusters has overtaxed Mr. Gibson's accuracy of line.

We award a prize of one guinea to "Doric" and half a guinea each to "Seleth" and Mr. E. H. Gibson.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

(Continued from last week.)

Friday, July 28.

To reach Coity Castle and Coity Church the train was taken to Bridgend, and the journey completed by motor.

Coity Castle.

The castle, which is completely in ruins, was built by Payne Turberville early in the twelfth century. It consists of a circular inner ward with a deep ditch all round it and a rectangular outer ward mainly of the thirteenth century. There were at least three gatehouses, that on the east side alone remaining more or less perfect. The building was (as pointed out by Mr. W. H. St. John Hope, M.A.) more in the nature of a fortified house of four storeys than a fortress; so the internal arrangements were dominated by domestic considerations, the military element being represented by strong outer walls. The main living-rooms were, as usual, on the first floor, the basement being given up to cellars, where food could be stored for the winter months, and to menial offices. On the south-west of the inner ward stood the hall. One curious feature of this is its passage and staircase leading to the round garderobe tower projecting from the curtain wall. This is thirteenth century, and the oldest part of the remains. The tower has its sides slightly flattened. Presumably this was done with the object of giving as little protection as possible to anyone attacking at that point. The flat sides were commanded by windows in the main wall, so that anyone creeping round the tower would be exposed to a hail of missiles. The residential portion of the castle would have been very comfortably planned for its period.

Mr. Iltyd Nicholl (who is a local antiquarian with a local knowledge second to none) gave some very interesting particulars of the personal aspect of the buildings. There were, he premised, no epoch-making events of history connected with any of these small "private" castles, as they are called in this part of Wales, in contradistinction to fortresses such as Caerphilly or Cardiff. Smaller castles like Coity formed a continuous chain, and were strongly defended by their owners, who kept in touch with each other in view of any possible rising of the Welsh. The name of Turberville is found in the neighbourhood in the first half of the twelfth century. When Robert Fitzhamon conquered Glamorgan, and parcelled out the land among his followers, the Turberville of that day found himself unprovided for. So he hurried to his leader and demanded what was going to be given to him for his services. Fitzhamon suggestively replied, "Oh, you can look after yourself." Turberville came to Coity, which was owned by a Welsh lord named Morgan, a grandson of the dispossessed native prince. The Norman knight summoned the castle to surrender. Morgan stoutly refused, but hinted that if Turberville would undertake to marry his daughter the gates would be thrown open and he would be received peaceably. This compromise was agreed upon, and for many generations the Turbervilles married exclusively into Welsh families, becoming more Welsh than the Welsh themselves, and taking their part in some of the risings. These latter soon broke out, through the ill-advised attempts of Fitzhamon, who had been raised to the dignity of the Earl of Gloucester, to suppress national customs. In 1094, while the Normans were engaged in the conquest of Gower, Payne Turberville of Coity marched to Cardiff and surprised Fitzhamon in his strong castle. The Turbervilles, however, are generally found fighting side by side with the English in the Scottish and French wars of the next two centuries. The family came to an end in the direct male line about 1350. Coity estate was strictly entailed in succession upon the sons of the four sisters of the last Turberville. The first to inherit was Sir Laurence Berkerolls. Additional fortifications were erected at the time of the Welsh rising under Owen Glyndwr. In 1400 this descendant of the last Welsh prince raised the flag of rebellion, and laid claim to the throne of Wales. After meeting with considerable initial success against the English, he profited by a lull to attack those Welsh chiefs who had stood aloof, among whom was the owner of Coity Castle. The story is that Glyndwr, wishing to obtain knowledge of the fortifications at Coity, obtained admittance to the castle under the guise of a bard, and only revealed himself when, after obtaining all the desired information, he rode away.

The castle was besieged in due time, and a loan was raised in both houses of Parliament for the purpose of effecting the rescue of its owner. This turbulent Welshman died a natural death in 1415 at the house of one of his daughters. The Gamages succeeded the Berkerolls at Coity. The last of this line was a very considerable heiress in the time of Elizabeth, and had several important suitors for her hand. But she was unwilling to regard herself as a pawn, and gave her affections to Robert Sydney, brother to Sir Philip, the favourite of the Virgin Queen. The greatly daring couple were married in the chapel of St. Donat's Castle just before the arrival of Lord Burleigh's messengers, who had come to carry off this eligible *parti*. In the middle of the eighteenth century the estate passed from the Sydneys, who sold their Glamorgan estates to the Wyndhams, though by that time the castle had become more or less dismantled. It now forms part of the Dunraven estate.

Coity Church.

Close to the castle, and behind it, is the small late thirteenth century aisleless church, with a central tower, whose bells rung out a welcome to the visitors. It was built all at one time, with the exception of the top of the tower, which dates from the sixteenth century. The chancel has been recently restored. The nave roof is, according to Mr. Brakspear, the original one, and the stone chancel roof is old, too. On either side of the western arch of the crossing is a small pointed recess, in each of which was placed an altar, and on either side of the eastern arch is a squint giving a view of the high altar. All the lower parts of the walls are battered for about three feet in height of ashlar work; the batter is carried higher in the tower piers. In the north transept are two small stone effigies of the Turbervilles, which Mr. Brakspear considered belonged to heart burials or which covered the graves of two children. In the chancel is a very curious oak chest, on the sides of which are several carved panels decorated with the emblems of the Passion. The panels are unquestionably mediæval, though their framing seems to be of later date. In the south transept stands a sexagonal font of the same date as the church; it has been supplanted for practical use by a modern font in the nave. In the churchyard is the base of a preaching cross. The gargoyles at the four corners of the tower over the crossing are noteworthy productions.

Coychurch.

Less than two miles to the south-east of Coity stands Coychurch. The church, which is the only object of interest in the village, was described by Mr. H. Brakspear, F.S.A., as the most architectural of any of the many small churches included in the programme of the Summer Meeting. It is an exceedingly interesting one. An obvious characteristic of it is the narrowness. It originally consisted of a chancel, two transepts, the central tower, and an aisleless nave. One reason for believing in the absence of aisles is that for some ten feet west of the tower the nave is not arcaded like the rest of its length, but has solid walls. Mr. Brakspear was of opinion that here stood the choir stalls. About the middle of last century the central tower fell down, and in doing so wrecked the chancel. When the rebuilding was begun, funds were, it is said, insufficient to complete the whole scheme. Against the advice of the architect the committee decided to leave work on the tower to a later day. As a consequence of another storm, what was left of the tower fell, and again wrecked the rebuilt chancel. The wooden waggon roof of the nave is of striking beauty, with its adornment of angels and carved bosses, and most especially for the simplicity of its construction. Clerestory windows are on the south side only. They were cut through the wall with but little regard to the centre of the arcade beneath them. These cinquefoil windows make interesting comparison with the curious quartrefoil windows in the west wall of each aisle. In the north transept are two effigies: one is of a layman, and has no inscription; the other is dated 1591, and shows an Elizabethan priest in his surplice. In the churchyard are the remains of two Celtic crosses, viz. a large stump behind the chancel and fragments of a cross on the south side, which became broken in the fall of the tower. There is also a mediæval cross raised on five steps. In the vestry were a few pewter vessels and other plate. It was interesting to hear that at least one of these pieces had been recovered by the present incumbent from among the household goods of his predecessor's wife after her removal. The obvious moral is that an inventory should be made as soon as possible of all property belonging to each church. In the cases elsewhere where this has been done some surprising results have occurred. There is little consolation in the thought that spoliation is usually committed in all innocence.

Ewenny Priory.

The programme said that Ewenny Priory (*vide* plans in Supplement, page 12) was founded in the early part of the twelfth century by the lords of Ogmore, one of whom gave it as a cell to Gloucester Abbey in 1141. It was fortified in the fourteenth century. Colonel J. P. Turberville, the present proprietor, who acted as cicerone, pointed out that the Priory was to be regarded from an entirely different point of view to the other churches on the programme, because it was quite as much a fortress as a church, and the whole plan clearly reflected the state of the country at the time when it was built. Ewenny was situated on an extremely weak line of Norman defence, and within half a dozen miles of it stood about ten castles. There is no exact information as to the early history of the locality, though a tradition exists that a Welsh church dedicated to St. Michael flourished here before the Normans came. This is supported by the discovery of pieces of carving which look like Celtic work. The earliest unquestionable date is 1141, when, as already mentioned, it was handed over to the Benedictine Abbey of Gloucester by William de Londres and his son Maurice. The original deed states it was founded for a prior and ten monks. It remained as a monastery until 1527, and was then leased by the Crown to Sir Edward Carne on the understanding that he was to keep the prior and the two monks remaining as guests. This arrangement apparently proved unsatisfactory, because Sir Edward shortly after bought the Priory outright. Towards the end of the eighteenth century the then lady owner allowed the place to become greatly neglected. Part at least of the church was utilised as a farm shed, and as such it appears in a drawing by Turner. John Carter, the antiquary and architect, writing in the *Gentleman's Magazine* in 1804, after an itinerary in this part of the country, said: "I hailed the sacred walls of this Priory Ewenny and exclaimed, I behold thee in the very moment when thou art about to lose some of thy 'time-revered honours.' Already is your southern boundary falling beneath the mattock; your porches, halls, chambers, galleries are waiting their final overthrow, even while the modern staircases, saloons, and drawing-rooms are rising on their blasted sites. Quick, let me note particulars. . . . To mention the condition of the edifice (the church) would be to combine all the thoughts given way to in the course of these essays on such occasions; let us, however, observe that the roofs in the transepts are falling in, their windows and those of the choir unglazed, and in a manner overgrown with ivy. The apparent neglect in every part, the accumulation of rubbish, and the real gloom around drove me from these ruinous walls, which to me at least imparted many a desponding thought."

About twenty years ago the brother of the present proprietor carried out some much-needed work, and Professor Freeman was called in to advise. The peculiar characteristics of the building have been ably described by Freeman, and we cannot do better than quote his account:—"So far as it exists at all it exists very nearly as it was originally built, and it consequently shows us what a religious edifice, raised by invaders in a half-conquered country, was required to be. When perfect it consisted of a nave with north aisle, choir under tower, presbytery without aisles, but with an arrangement of chapels attached to the transepts. The western limb formed the parish church, the choir the presbytery, and the appendages formed the church of the Priory. The division was made by a solid wall across the western arch of the lantern, acting, of course, at once as the reredos of the parish church and the rood screen of the Priory. . . . The parish church could not be concealed within the monastic enclosure: the parishioners must have free access without passing through the gateway of the monastery; consequently, the whole north side was exposed, while the monastic buildings were attached to the south. The result is that the church itself becomes part of the line of defence, and hence the extent to which it assumes a castellated character."

It will be judged from Professor Freeman's account that the church is full of interest; and the visitor of to-day will not be disappointed. The wooden screen now dividing the presbytery from the space under the tower has fourteenth century tracery with fifteenth century solid panels below. It was removed from the nave, where it served as a fence screen to the altar of the parish church. When the part east of the crossing was reserved exclusively for the monks they would only need an enclosure to the monastic choir, which came almost up to the solid wall, merely leaving sufficient room for processional purposes and for the monks to enter their choir. The former consideration, as Mr. St. John Hope explained, accounted for the existence of every one of the numerous door-openings which puzzle many people. The stone rood screen and reredos combined is one of the few existing instances of such a feature in monastic churches; other places where it occurs are Boxgrove, St. Albans, Tynemouth, and Crowland. The south transept contains several old tombs, amongst them being that of "Morice de Lundres le fundur," which is in an extraordinary (and suspicious) state of preservation after seven centuries. Another is an imposing mid-seventeenth century tomb, and there are also slabs showing early and pre-Norman workmanship. High up in the west wall of this transept is a delightful arcade of seven small round arches cut in the passage to the central tower. The nave was shortened westward by fifteen feet over a hundred years back, and the north aisle was rebuilt about fifteen years ago. There never had been an aisle on the south side, as the cloister came up to this part of the church and down the west wall of the adjoining transept.

The house itself is conspicuous for its lack of external interest. The greater part shows a typical early nineteenth century front in stucco, although it incorporates thirteenth century fragments. The precinct walls remain for the most part (with the single exception of the south wall), as well as the square towers at each angle and the two strong gates on the north side, which was of old the principal front. It was on this side that the danger ever threatened from marauding excursions by the wild Welsh, who could pour down from the hills, which were within an easy night's march. The extreme length of the fortifications is 190 yards, and their greatest breadth 130 yards. They enclosed an area of nearly five acres.

Without breaking the laws of guesthood, we may be permitted to endorse the remarks Mr. St. John Hope took occasion to make concerning the prevalence of ivy, which, vampire-like, clings to the time-honoured walls. Colonel Turberville is obviously a man keenly aware of his responsibilities as the owner of such an historic place. He has already done much, but more remains behind. For, as Mr. Hope aptly said, there is only one Ewenny Priory, and there is ivy in abundance elsewhere.

The visit concluded with tea in the Priory grounds, and the return to Cardiff was made by motor-car and train. At the subsequent evening meeting Mr. W. H. St. John Hope gave an entertaining account of the excavations in progress at Old Sarum, which he has been superintending for several months. By means of lantern views he gave an excellent idea of the way in which this site was treated and of the considerable progress made in uncovering the deeply-buried foundations of a Norman stronghold.

Saturday, July 29.

Margam Abbey.

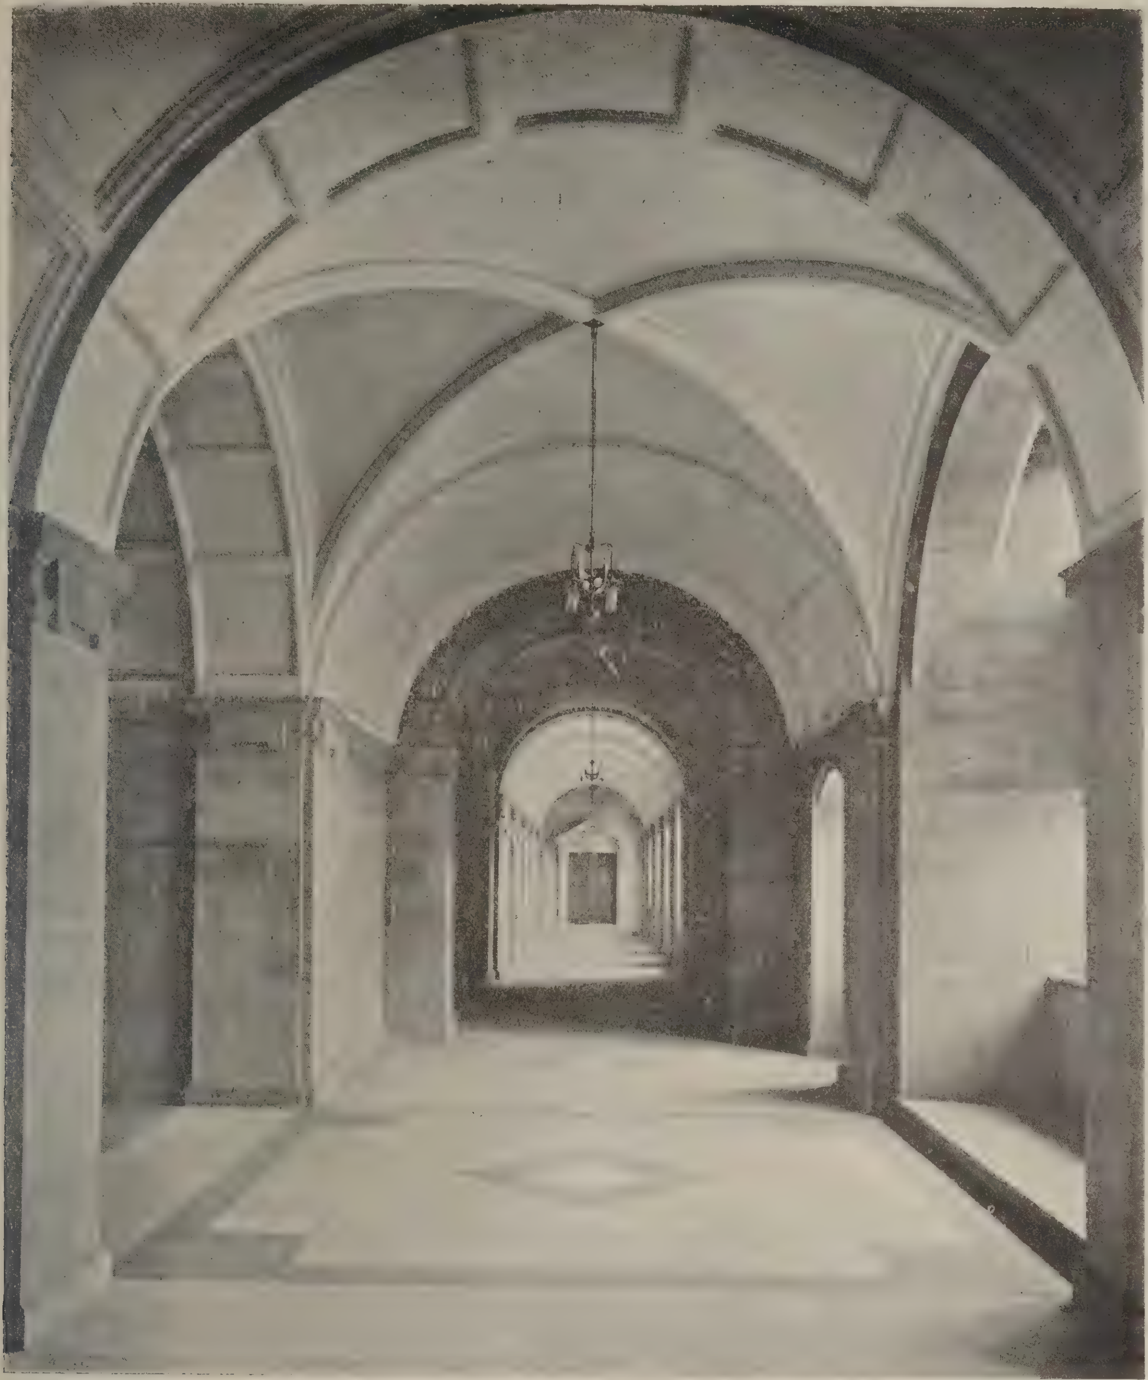
The Cistercians, or Bernardines, were transplanted into England from the abbey of Aumone in Normandy in 1128 by Walter Giffard, bishop of Winchester, who established them in his newly-founded monastery at Waverley, in Surrey. Within twenty years they had reached South Wales, and established themselves at Margam. Tanner (in his *Notitia Monastica*) and Dugdale ascribe its foundation to Robert, Earl of Gloucester, natural son to King Henry I., and date its foundation A.D. 1147. It is also occasionally ascribed to Morgan, a Welsh lord, contemporary with Earl Robert. It is stated that the beginning of Margam was near Pontypridd, at Pinder, where a hermit, Meiler, obtained a grant of land for a Cistercian abbey. Possibly this may account for the subsequent confusion. The Earl of Gloucester granted to the monks of Clairvaux all the land between the Kenfig and Aven streams for founding an abbey. Before the Norman Conquest there used to be a religious establishment in the neighbourhood; but the present buildings, though of great historical interest, have nothing to do with that. In 1224 the abbey was attacked by the Welsh, but there is no record of any damage having been done. About that time, said Mr. Harold Brakspear in his description of the buildings, a number of small Cistercian houses in Ireland got into low water, and applied to their mother-house at Mellifont for aid. Owing to their poverty the mother-house could do nothing. At least one of the Irish houses was at once handed over to Margam to keep going, and three others followed. In 1326 the abbot appealed against the general taxation, on the ground that his house was a poor one, as he had to support thirty-eight monks and forty conversi. The yearly revenue of the community at its suppression was £188 14*s.* gross, or £181 7*s.* 4*d.* clear. The site was granted to Sir Rice Mansell, for which he paid £936 6*s.* 8*d.*; Miss Talbot, the present owner, is a direct descendant of his. The nave of the church, of the date of the foundation, remains, and is still used as a parochial church. This, said Mr. Brakspear, is the only Cistercian church which has round arches in the nave instead of pointed ones, and the fact is especially noteworthy because the Cistercians introduced pointed arches. In the thirteenth century the church, which up to then was the usual type of aisleless presbytery, was lengthened eastwards. The east end of the south aisle contains four beautiful alabaster tombs, which were apparently executed all at one time and in the same place. They begin with Sir Rice Mansell and his wife, whose figures are on top, while their children are carved in high relief round the base. The three other monuments commemorate the successive holders of the property. The interior is extremely spacious and imposing.

A conspicuous feature of the monastic ruins is the chapter-house. Of this an enthusiastic archæologist wrote many years ago: "If ever truth in architectural design, proportion, or symmetry of parts were made evident, where not anything is too profusely charged or too simply set forth, here most assuredly stands a model of all that is desirable in the noble science." This high praise seems justified by the building itself and by the charming vaulted passage leading to it. About 1800 the vaulting of the chapter-house collapsed through neglect. A traveller, writing in 1799, says: "It concerned us to see the beautiful circular chapter-house in a state of dilapidation that must speedily reduce it to a heap of ruins. Great part of the roof has fallen in, the ribs which support the remaining portion are giving way, and no care seems to be taken to repair what is already dilapidated or to prevent further injuries." His fears were all too quickly realised. Behind the abbot's seat is a curious quatrefoil opening. The chapter-house has pointed window heads, and in plan is circular within and twelve-sided on its outer face. Close by is an inscribed ancient cross which, with the numerous others in the church itself and elsewhere, make a visit to Margam as interesting to the archæologist as to the architect.

In the grounds is a long building or orangery. The story is that some two or three centuries ago the royal house of Spain, exchanging courtesies with the English royal house, despatched a cargo of orange trees to this country. The vessel, however, got wrecked off the rocky coast of Wales, and the trees were conveyed to Margam for temporary safe guarding. But they never left the abbey. At present the orangery is empty, if we except the tables well laden with wine and cake and other refreshment which were awaiting the party.

Neath Abbey.

John Carter in 1804, like the Royal Archæological Institute, passed from Margam Abbey to Neath Abbey, and he wrote: "A clear and ambient air I leave; and pestilential vapours and noxious mists now assail me as I forward march and see the town of Neath, dark and sulphurous." Arriving at Neath, he thus pours forth his outraged feelings:—"Ye powers! how horrid, how infernal was all before me! Deep in the very centre of the sacred walls were set the furnaces wherein the poisonous ore becomes a prey to fusion. What dreadful crash of mighty engines! What oaths, what im-



THE MAIN CORRIDOR, UNIVERSITY COLLEGE OF NORTH WALES.

precations! With flames and smoke the scene was filled, the sad prototype of that place of outer darkness which the wicked alone must know. A bell is tolled, and see, the brotherhood comes forth. Their vestments are sable, it is true, their visages pale and wan, but not through the austerities of religious observances, as of the old sojourners in this devoted ground, but through the rage of heat, metallic effluvia and ungovernable inebriety. Standing within the verge of the grand gateway to the abbey, an absolute ruin, alike bearing the marks of pestiferous exhalations, I found it impossible to approach the abbey." Things have improved since that was written a century ago. Nevertheless, the setting of Neath Abbey is a poor one for such a jewel, and must forbid assent to the Elizabethan's cry that it was the fairest abbey in all Wales. The furnaces are gone, but on the circumference of the precincts remain black mounds of débris.

The abbey was founded, according to Mr. H. Brakspear, in 1129 or 1130 (*vide* plans in Supplement, p. 13) by Sir Richard Granville, for twelve Savignian monks and an abbot. This reformed Benedictine order was established by Vitalis, a Norman, after many vicissitudes at Savigny, in Avranches, in 1112; they founded thirteen houses in England and Wales, one of the earliest being this at Neath. The monks were so closely related to the Cistercians that in 1143 the fourth abbot handed over his abbey and those dependent on it to them. All that remains of the buildings is Cistercian work. The reasons for none of the original buildings remaining are that these were of very small size, and as the Order took on very rapidly in the neighbourhood they had to provide greater accommodation, and also that in 1224 Morgan ap Owen burnt the abbey. There is no work standing earlier than the thirteenth century. The buildings were still in progress in 1289, for in that year Gilbert de Clare, Earl of Gloucester, granted all the timber for the new work. In 1326 Edward II. took sanctuary at Neath for ten days after his escape from Caerphilly Castle, pursued by Queen Isabella and the barons. It was not a rich house, for in 1534 the gross revenue was returned at £150 4*s.* 9*d.* At the suppression, it ought to have been given up at once, but by paying a fine of £150 in 1537 they were allowed to continue for a further two years. In 1539 there were only eight monks left, and it was converted into a manor house by Sir Robert Williams, *alias* Cromwell, nephew of Thomas Cromwell, and trusted minister of Henry VIII. Great alterations were carried out to the buildings by Sir Peter Hoby in the middle of the seventeenth century to convert them into a more convenient mansion.

As in all monastic buildings, as Mr. Brakspear remarked, the cloister was the centre of everything. The ruins of the church show late thirteenth century work. It was a very blunt-proportioned building. A curious feature about it is the porch at the west end, which, according to precedent, ought to have gone right across the nave and aisles. The church was vaulted in its main span, as well as in its aisles. About fifty years ago the eastern end was excavated, and a number of fine tiles were brought to light; some of these are now in the Swansea Museum. The plan we give this week shows the arrangement of the building.

As a contrast to Carter's depressing accounts we may conclude with this description by Lewis Morganwg, the famous Welsh bard:—"Like the sky of the vale of Ebron is the covering of this monastery; weighty is the lead that roofs this abode—the dark blue canopy of the dwellings of the godly. Every colour is seen in the crystal windows; every fair and high wrought form beams forth through them like the rays of the sun. Portals of radiant guardians! Pure and empyreal, here is every dignified language and every well-skilled preceptor. Here are seen the graceful robes of prelates, here may be found gold and jewels, the tribute of the wealthy. Here also is the gold-adorned choir, the nave, the gilded tabernacle-work, the pinnacles worthy of the Three Fountains. Distinctly may be seen on glass, imperial arms, a ceiling resplendent with kingly bearings, and on the surrounding border the shields of princes; the arms of Neath of a hundred ages; there is the white freestone and the arms of the best men under the crown of Harry; and the church walls of grey marble. The vast and lofty roof is like the heavens on high, above are seen archangels' forms; the floor beneath is for the people of earth, all the tribes of Babel, for them it is wrought of variegated stone. The bells, the benedictions, and the peaceful songs of praise proclaim the frequent thanksgiving of the White Monks."

(To be continued.)

THE STATUS OF ENGINEERS AND SURVEYORS.

MR. P. C. COWAN (Chief Engineering Inspector, Local Government Board for Ireland), in opening the proceedings at the Conference of Engineers and Surveyors to Local Authorities at the Royal Sanitary Institute Congress, said that the first of these special conferences was held at Portsmouth in 1892, under the presidency of Mr. H. Percy Boulnois, who was now the chairman of the Council of the Royal Sanitary Institute. He then presented a most interesting chart, setting out the duties of the municipal engineer under ninety-eight sub-divisions, grouped under the main headings of engineering, land surveying, architecture, administration, and miscellaneous. He would not pause to consider the additions to this chart, which might be made on account of the numerous Public Health and Sanitary Acts which had been placed on the statute book since 1892. A glance at the chart showed how great and varied were the demands made upon the abilities and energies of engineers and surveyors to local authorities, and the extent to which the health, convenience and well-being of the community depended on the efficiency with which those demands were met. The value of the services of county and municipal engineers was not yet sufficiently appreciated, and, as a rule, they were underpaid. County surveyors in Ireland appointed before 1898 enjoyed the advantages of a salary regulated by the Schedule to an Act of Parliament and a tenure of office which could only be disturbed with the sanction of Government. The scheduled rates of salary were moderate and could not be increased. This was, of course, in some way objectionable, but the net result was that a competent and faithful county surveyor had no cause to dread loss of office, and no temptation to shirk unpleasant duty, the performance of which might for a time give offence. The Local Government (Ireland) Act, 1898, maintained the examination for the appointment of county surveyors, which had existed since 1833 and the security of tenure of office, but the schedule of salaries had disappeared. Since 1898 a number of appointments had been made to the position of county surveyor and assistant county surveyor at salaries markedly below those considered reasonable and necessary many years ago when duties and expenses were less than they were now. In some respects the law in force in Ireland was more favourable to engineers and surveyors than the corresponding statutes in the sister island. County surveyors, assistant county surveyors, and practically all town surveyors, as well as sanitary officers, had security of tenure in this country and could only be removed from office with the consent of the Local Government Board. This provision had proved very beneficial in his opinion, and though now and then a tactless officer might presume too far on the protection the law affords him, the control of the authorities over their servants was not unduly affected. It was only right to say that Irish local authorities were most invariably considerate and lenient towards their officials, and that nowhere were firmness and impartiality more appreciated than in this country. The Irish were a quick-witted race, and they had an absolute contempt for an official who "wobbled" or was uncertain in the discharge of his duty. The absence of provisions in the statutes to prevent incompetent persons from acting as engineers or architects was much to be regretted, and doubtless accounted to some extent for the low estimate often put on the services of engineers and architects. It was most desirable in every proper interest—and especially in that of the ratepayers—that the law should be amended so that at least all public works should be designed and supervised by persons possessing at least such minimum qualifications as might be prescribed by the central authority sanctioning the works or expenditure. It would evidently be a great step in advance if a more efficient and economical expenditure of public funds on works were thus ensured, though some private individuals might continue as at present to consider the service of all professing engineers and architects as equal in value, and to employ these practitioners who asked least for their services without consideration of the large percentages which were commonly saved or wasted by good or bad design and supervision. This was a matter which could be more easily dealt with than the wider question of the registration of civil engineers or architects, and he was glad to say that the thin end of the wedge had been inserted by the provisions of the Labourers (Ireland) Act of 1906, section 27 of which said "Every person whom a district council propose to employ as architect, engineer, surveyor or clerk of works, for the purposes of the Labourers Acts, shall satisfy the Local Government Board that he has sufficient knowledge and experience for such employment." The Act empowered the Local Government Board to make rules and regulations, and a General Order of 1906 stated who should be deemed eligible for employment as architect, engineer or surveyor.

This new departure in legislation would, he hoped, be a fruitful precedent for further legislation to protect the public from the blundering of incapable self-styled architects and engineers. Now that there were numerous well-equipped engineering schools attached to the universities, there was no good reason why some protection should not be afforded to the profession. Every year between thirty and forty young men took degrees in engineering in the three Irish Universities, Trinity College, Dublin, the National University, and Queen's University, Belfast, and the courses for the degree are excellently framed to fit the graduates for successful professional work. As an example of the practical training now obtainable in the Irish Universities, he would mention that the designs for large reinforced concrete floors for building extensions at University College, Cork, and for a new bridge of the same materials crossing the Lee, were lately worked out in the Engineering School, and that the materials for the very important new bridge over the Suir at Waterford were tested in the laboratory of the same school. He ventured to think that the time was now opportune for legislation which would protect engineers and architects from unfair competition, and the public from the very serious loss which now arose from their displacement by practitioners who were not qualified. There was now a sufficient supply of properly trained men, and no good reason why the safeguards afforded to the practice of law and medicine should not be extended to those whose function is "the art of directing the great sources of power in Nature for the use and convenience of man." If the Institutions of Civil Engineers, the corresponding architectural associations, and the Universities were to combine in an effort to secure proper recognition of the professions of engineering and architecture, success would ere long be obtained.

ILLUSTRATIONS.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR.

WE this week complete our series of illustrations of these buildings, of which Mr. Henry T. Hare, F.R.I.B.A., is the architect.

CATHEDRAL SERIES: ELY.—NAVE LOOKING WESTWARD—SOUTH NAVE AISLE LOOKING EASTWARD.

WE continue our series of views of Ely Cathedral with these illustrations this week.

NEATH ABBEY.

RECENT EXCAVATIONS AT CAERLEON (ISCA SILURUM) AND CAERWENT (VENTA SILURUM).

THESE two important Roman sites are situated in South Monmouthshire, the former three miles north of Newport, and the latter eleven miles to the east of that town. They are both of the same area and shape, but Caerleon was the fortress of the second legion and Caerwent was a civil town.

Excavation proves that Caerleon was founded in the reign of Vespasian about the year 78 A.D., and that from that time to the latest period of the Roman occupation it was an important centre. Caerwent, on the other hand, was first of all a temporary camp on the line of march westwards, and later, towards the middle of the second century, developed into the city we know it to have been.

So far little excavation has been done at Caerleon, but that little gives promise of interesting finds when the whole of the work is completed. By the kind permission of Sir Arthur Mackworth, Bart., we were able to explore the south angle of the fortress within the Priory grounds, and here the early earthwork, angle tower and other walls came to light. A trial excavation was also made in the amphitheatre, or King Arthur's Round Table, as it is called. Quite unexpectedly it was discovered that here had stood what was probably the finest amphitheatre in Britain. The outer wall is 5 feet 6 inches in thickness, and has buttresses inside and out, and we were able to open out part of the south gate and inner or arena wall, into which was built a centurial stone, recording the fact that that portion of the wall was built by the third cohort of the legion.

It is of great importance that the excavation of Caerleon should be proceeded with as speedily as possible, as it is the only great military fortress in Britain which can be explored to any extent, York and Chester being the sites of two important modern cities as well as Roman fortresses.

About one-third the area within the walls is at present available, but some of this land is up to let for building purposes, and there is great danger of the small area now open to spade work being greatly reduced. Outside the walls the amphitheatre, baths, cemetery all await the hand of the excavator.

Caerwent has been the scene of careful scientific excavation for the last twelve years, and some twenty-five out of the forty acres within the walls have been explored.

Sufficient has been done to accurately plan the streets as well as most of the public and other buildings in the city. The site of the public baths has been identified, but so far it has not been possible to obtain permission to excavate them. Outside the city the cemetery and two or three Roman villas still remain to be examined.

The basilica with the forum to the south of it, a temple, a small and probably incomplete amphitheatre, besides some forty dwelling houses, shops, and workshops, have been uncovered, and detailed plans of all have been made.

The streets of the city were well laid and drained, the houses were well planned, and the sanitary arrangements were on the whole good; in fact, much better than often at present obtain in some of our modern country towns and villages. Water was obtained from wells, of which about twenty have been cleaned out, and from a service of wooden pipes laid in the streets. These pipes occasionally burst, and were repaired with pieces of sheet lead nailed down over the break.

The city walls and the buildings were well built of the local limestone, and the quoins and large moulded and ornamental blocks were of the soft yellow sandstone which is found on the banks of the Severn at Portskewett, or of the easily worked freestone from Dundry, near Bristol.

The roofs were covered with old red sandstone tiles, which were fixed with iron nails, and the ridge pieces and ornamental finials were of Dundry stone.

It is impossible here to describe all the pottery and small iron and bronze objects that have been found, all of which can be inspected in the museum at Caerwent, which will well repay a visit.

ROYAL SANITARY INSTITUTE.

AT the Royal Sanitary Institute Congress at Belfast on July 28, Mr. H. D. Searles-Wood, F.R.I.B.A., read a paper on the "Influence of Building Regulations on Architecture":—

The earliest building regulations are found in the laws of Khammurabi. They are over 4,000 years old, and are as follows:—

ccxxviii. If a builder build a house for a man and complete it, he shall pay two shekels of silver for each sar of surface.

ccxxix. If a builder build a house for a man and has not made his work strong, and the house has fallen in and killed the owner of the house, then that builder shall be put to death.

ccxxx. If it kill the son of the owner of the house, the son of that builder they shall kill.

ccxxxi. If it kill the slave of the owner of the house, a slave equivalent to that slave to the owner of the house he shall give.

ccxxxii. If the property of the owner of the house it destroys, whatsoever it destroys he shall make good, and as regards the house he built and it fell, with his own property he shall rebuild the ruined house.

ccxxxiii. If he build a house for a man and did not set his work, and the walls topple over, that builder from his own money shall make that wall strong.

These Babylonian laws were based on the *jus talionis* principle. A life for a life, an eye for an eye, a tooth for a tooth was the natural law of life, and it is found in all communities.

I think, therefore, I am justified in saying that the first designer of the pyramids had these laws in his mind, and he was not going to take any chances. You see under this code the builder's family were very directly interested in the stability of the work, and it must have required an heroic effort to introduce a new feature that had the slightest appearance of disturbing the repose of the structure. Buttresses were popular, as may be supposed, and recessed panels. These early people used hollow walls to keep the rooms in their dwelling-houses dry and cool, built staircases, and, although it is not quite germane to this subject, it is interesting to note that the bricks they used were made to a standard size, ranging from $8\frac{3}{4}$ by $5\frac{5}{8}$ by $2\frac{1}{4}$ inches to 9.6 by 4.9 by 3 inches. When we were working out the Royal Institute of British Architects standard size for bricks these were considered, and our standard size, $8\frac{7}{8}$ by $4\frac{5}{16}$ by $2\frac{5}{8}$ inches to 9 by $4\frac{3}{8}$ by $2\frac{11}{16}$ inches, is, as you see, very nearly the same. What this really means is that the handiest size for a Babylonian bricklayer to handle all day long was the same as the British bricklayer finds the easiest to handle to-day.

The XII. tables of Roman law contained several building regulations, and as they were drawn up by a commission that collected statute laws from Greece and other foreign countries, they may be taken as the standard for the period. Only fragments of them are known, and they chiefly relate to easements such as you were not allowed to have, dripping eaves, &c., and they do not appear to have made much mark on Roman architecture.

In mediæval England the domestic houses were built on traditional lines, but how far these traditions were regulated by by-laws I cannot say. The overhang, which is a common feature, and which was first used in town houses to protect the goods exposed on stall boards, and afterwards copied in the country, where there was no likelihood of the houses having stall boards; this overhang was regulated by by-laws, so that the projection should not interfere with people riding through the streets on horseback.

In modern building regulations three things are considered—first, the prevention of the spread of fire; second, the construction of the building to guard the safety of the public; and third, public health.

It is the regulations that deal with the prevention of the spread of fire that have had the greatest influence on the architecture of the period.

The regulations passed after the great fire of London set the fashion for brick and stone-fronted buildings which altered the appearance of all the towns in the kingdom, and in more recent times the Metropolitan Building Act, which was the first set of building regulations that seriously dealt with the problem of the prevention of the spread of fire, made marked changes in the architecture of the nineteenth century. The $4\frac{1}{2}$-inch reveal to all windows and doors, and the restrictions as to barge-boards and wooden cornices and the parapets to the party walls, are the marks of this set of regulations.

The rules laid down in the Metropolitan Building Act of 1854 for dealing with the rights of the building and adjoining owner of a party wall have worked so well that it is surprising no other city or town has adopted the same system.

This method of dealing with a difficult situation is really a good help to architecture, and some such system should be part of the statute law. At present the law on the subject is that the party structure is common to the two parties, the building and the adjoining owner's, and it cannot be touched without the assent of both parties, and there is no means of compelling this consent. It is in this respect that the London practice has such great advantages.

There is a tendency nowadays to complain that the model by-laws are too severe, and that they prevent the building of cheap cottages and elementary schools. At the first exhibition of cheap cottages at Letchworth, the cottage that won the first prize was in accordance with the model by-laws in every particular. In going round the numerous Garden City developments, the only two things in the by-laws that appeared to increase the cost were the height of the bedroom storeys, where 9 feet is insisted on, and the height of the studded walls, which is also regulated by this by-law. In places where the storey is 8 feet the available area is also increased, and there does not appear to be any serious sanitary point in requiring 9 feet storeys.

The Building Acts and model by-laws are all based on brick construction; the introduction of skeleton steel construction and reinforced concrete necessitates some changes in these Acts and by-laws.

The Royal Institute of British Architects have just issued a second edition of the Regulations for Reinforced Concrete Construction, which are the standard for such method of building in the British Empire. This revised edition will be the basis of the Regulations about to be issued by the London County Council, and will be dealt with very much on the lines of their Regulations for Skeleton Steel Construction, which are in their Act of 1909. The principle is that the calculations on which the steel construction has been designed are submitted, with the drawings, to the district surveyor, who checks the calculations before the plans are approved. These calculations can be made in any form that is recognised by the profession; but a good method of tabulating the calculations has been drawn up by the District Surveyors' Association and approved by the Royal Institute of British Architects, and it is a great saving of time and labour if the information is given by the architect to the district surveyor in this form.

The Regulations for Reinforced Concrete give the tests to be applied in selecting the materials and the methods of calculating the various parts of the building, the method of mixing the materials, and the precautions that have to be taken in preparing the centring and carrying out the work.

Some people are of the opinion that the time has come when there should be a general Building Act for the whole country; let us hope if this comes to pass that it may be so drawn as not to stereotype existing methods of construction, but stimulate new and better methods than at present. It might be a good thing to encourage architects to work out the strains and stresses in their structures by making a law that the methods of calculating the designs should be submitted to the District Surveyor, and if found correct the construction should be allowed, and thus do away with all those cast-iron schedules and rules that so often hamper an original design.

It may be said that these are matters which do not directly influence architecture, but with the introduction of new materials and methods of construction, new means of expression must be found. It is true that over 4,000 years ago men were using the same materials as are now commonly in use, but during that time what varied expression has been given to the use of these materials. Each succeeding race has written its history in monumental works that are our most cherished possessions, and we in our time must strive to leave behind us some monuments worthy of the age in which we live.

Mr. John Slater said they might congratulate themselves as architects that the stringent laws which existed in Khammurabi's time did not exist now, or he was afraid the profession would not have many people come into it. The author had referred to mediæval regulations and talked about the construction of overhanging eaves, but there was one very curious thing he had not alluded to. They were required to have overhanging eaves at the side of the building in a great many places, and the same thing applied to the building next door. It was required by the old regulations that a certain space should be left between the side wall of one house and the side wall of another, so that instead of a party wall they had a party open space, and this had remained in some cases until now. "Twichel" was the expression used for the space between the buildings. He had often asked architects what a "twichel" was, and no one knew. The title of the author's paper was "The influence of building regulations on architecture," but as to what the influence was he had been rather reticent. He could not help thinking that it might be either extremely bad or extremely good. If they had building regulations too hampering or restrictive, they would damage architecture exceedingly. He always thought that it was a mistake to make building regulations too exacting and definite. Even if they did their utmost they would never be able to provide in any regulations for all cases which arose, and he was sure the best plan was to lay down general rules which should be followed, leaving a certain amount to the discretion of those who had to carry out the regulations. It was said that this was all very well in the case of an architect of reputation and experience who was putting up a building, but that for the speculative builder definite regulations were required. They would still find that when they put down any building regulations as a minimum they would always be taken by the builder as the maximum, and there were many cases where the by-laws were complied with by the builder, and yet the result was a very inferior thing. The author had referred to the regulations for dealing with the rights of party owners, and there was no doubt in many cases that these regulations saved an enormous amount of trouble and litigation. Copies of the particulars which it was suggested they should fill in for steel construction had been shown them, but he personally did not think it was necessary to have these minute regulations. They had no doubt to be very careful with steel construction, but to go into the minute details as suggested to him seemed to be straining the Act.

Mr. Brodie (Borough Engineer, Blackpool) said that he would welcome anything which would simplify the laborious duty of specifying by-laws, for often it happened that in the most carefully drawn-up building by-laws, points which arose were not covered. For any new Building Act to come up for the whole of Great Britain and Ireland which laid down minutely what ought to be done would be a great mistake. General principles covering the safety of the structure and also the health of the people who had to occupy the buildings was all they could attempt, whether it be a dwelling house or a large meeting place or a warehouse. He thought it was the only safe course which could be taken so long as they had these general principles embodied and the utmost liberty and discretion given to those who had to administer the Act. It would be a great mistake to have a whole lot of tabulated statements that this and that should have a certain strength and so on. That would have to be left to the judgment of the architect responsible for the building and the common sense of the authority and their officers who had to see that the Act was administered in an honest, straightforward manner.

Mr. E. T. Hall said that the subject brought up by the author was one of very great importance. He thought they would prevent experiments in new forms of building if they were going to lay down cast-iron rules; and they would render it very difficult for the architect who had got some new method of expressing himself by stereotyping rules and regulations to give effect to that. The greatest objection he had ever heard to the present system was that if they left it to the discretion of those who were carrying out the Act they were leaving it to an unknown quantity. The great majority of the men who had the final carrying out of the Act were men of great common sense and great experience, but it was within the knowledge of everybody that they occasionally came across men who were not gifted with common sense and who had not the training, and these men were troublesome and obstructive. Because of such men as these many persons had sought refuge in having strict regulations laid down. He had had experience of one or two such men, and would confess that it was a great trial to the flesh. But he must say that on the whole 98 per cent. of the surveyors to local authorities who administered the by-laws were sensible and considerate in dealing with them. With the author he felt that it would be a great blessing if they could get rid of the costly litigation and obstruction and confusion which arose from light and air cases. They had the Dean of Guild Court in Scotland before whom such matters were settled. The Royal Institute of British Architects drew up a Bill to get rid of light and air disputes, but when the decision in the Colls case was given in the House of Lords it was felt that the present law was quite sufficient. The decision in that case was a common sense one, but he was sorry to say that since then there had been several decisions which appeared to have been arrived at without any reference whatever to the decision in the Colls case. Personally, it seemed to him an iniquitous thing that a man should acquire a right against his neighbour simply because the neighbour had delayed building on his land, for it often happened that the delay was due to the wish of the owner to consider the amenities of a district. He did not see why light and air cases could not be dealt with in the same way as were party-wall cases under the London Building Act. In case of dispute power was given to the building owner to appoint a surveyor and to the adjoining owner to appoint another surveyor. These two selected a third surveyor, and a decision arrived at by two of the three was binding in law, subject, of course, to certain rights of appeal. The Tribunal of Appeal under the London Building Act was another body which could very properly deal with such matters. That was a body consisting of a barrister, an architect, and a surveyor, and their decisions were based on common sense. He suggested to Mr. Slater that possibly the word "twichel" might be derived from "twi-chemel."

Mr. Slater remarked that he did not think that was so.

Mr. Cutler (City Surveyor, Belfast) said the ordinary staff of the City Surveyor would have to be supplemented if there was going to be a large progress in steel and ferro-concrete construction. His opinion was that the more cast-iron the building by-laws were as applied to ordinary construction the better it was, and he could not agree that those by-laws had any prejudicial effect on architectural practice. It had always to be remembered that the buildings in any town were not in the main put up for architectural beauty. They might regret it, but still it was the fact, and building by-laws were absolutely essential. Whilst he could understand the architect's view, yet the local authority had to deal with the jerry-builder and with the man who wanted to supervise work himself even without a builder, and in all such cases the more cast-iron the by-laws were the better. The building by-laws were also of great assistance in cases where an applicant whose plans were disapproved tried to get round the back of the surveyor, for they gave the Committee the chance to stand firm. They had no by-laws in Belfast to deal with ferro-concrete structures, but they had endeavoured to use discretion in regard to such buildings and had relaxed some of the rules which applied to brick and stone buildings so as to meet different cases in a reasonable way. His opinion was that where a reasonable body of business men conducted municipal work, architects had no cause to be afraid of by-laws.

Mr. Lacey (Oswestry) also expressed the view that building by-laws had no prejudicial effect on architectural practice, and in regard to ordinary brick and stone buildings he did not think they were in any way too severe; in fact, in regard to air space and other matters they were below what the minimum ought to be. He agreed generally with what had been said as to ferro-concrete structures.

Mr. W. H. Whyatt (Grimsby) considered that the by-laws were not too severe for London, but thought that there might be some modifications in the provinces, where the buildings, as a rule, were not so high. The quality of the bricks used in the provinces was much better than those used in London, and he believed they could carry a 9-inch wall up 10 feet higher in the provinces with safety. There was also no necessity of carrying the party wall through to the roof in the country, which was an expensive matter. He considered it was a mistake to give officials any discretion with respect to the enforcement of by-laws, because if they relaxed one rule everybody at once knew it and made applications for some relaxation in other directions.

Sir Henry Tanner (H.M. Office of Works) said that practically he carried out his buildings free from building by-laws, and he was in favour of latitude as far as possible in all by-laws. In the case of reinforced concrete he did not see how it was possible to draw up any code of rules which would cover everything which might arise, and he would prefer that each case should be dealt with on its merits. Whilst it was a simple matter to design a beam or a column single, yet when they came to connect the whole thing together practical experience came in, and it was here that the specialists in ferro-concrete construction got an advantage. Seeing, however, the price at which buildings could be erected in ferro-concrete, it was a form of construction which was bound to grow. The Government did come under the London Building Act in regard to the provisions made for the settlement of party wall disputes, and in this connection he thought there was too long a time spent over the matter, and that the third surveyor should be given greater authority to come to a decision quickly.

Mr. P. C. Cowan (Irish Local Government Board), who said it had fallen to him to revise the building by-laws for Ireland, had a strong opinion that the by-laws of Ireland could have no prejudicial effect whatever on architectural practice, whilst he was equally certain that it would be a great mistake if they were relaxed in the case of ordinary common buildings. In the case of ferro-concrete buildings he thought they could have the plans submitted with the calculations for the approval of the local authorities. On the question of by-laws generally he had never been able to make out what the real grievance of architects was to them. There was no power except in one or two of the large towns to waive building by-laws. It was unfortunately done in some cases, and he believed in nearly every case it was a mistake.

Mr. Munce (Belfast) said that in Belfast they built houses for the people to live in and not to look at. They had no real trouble with architects, but they did have trouble with people who wanted to build themselves. He considered that power was wanted in the by-laws to regulate the size of rooms.

Mr. Searles-Wood, owing to the length of the discussion, said he would not attempt to reply to the points raised. As an old district surveyor he was in favour of by-laws.

CALCULATIONS FOR RETAINING WALLS.

(Continued from last week.)

14.—*A Formula to Suit any Case.*

We have determined the stresses on the joint AB in a very simple case by argument, and must now attempt to deduce a formula applicable to any case.

In fig. 6 it has been noticed that the effect of the new position of W was to make the crushing at A twice the amount it was when W was central, the stress at A being f_0+f_1 and at B being f_0-f_1. If in this latter case f_1 should be greater than f_0, the crushing or compression will be a minus quantity—in other words there will be a tension. f_0 being uniform over the joint is easily found.

It is the weight per unit area, and equals the total weight divided by the area of the joint

$$= f = \frac{W}{A}. \text{ (\textit{See} paragraph 5.)} \quad \ldots \quad (1)$$

In fig. 6 and paragraph 13 we have shown that wherever W is applied there is an equal and opposite resistance, the centre of gravity of which is below C, the point of application of W. This resistance is called T.

Now as W and T are equal and opposite their moments about any point must be equal and opposite.

Take moments about O.

$$M_W = W \times OC.$$

$$M_T = T \times OC.$$

The magnitude of T is the area of the triangle of stresses multiplied by the stress per unit of area.

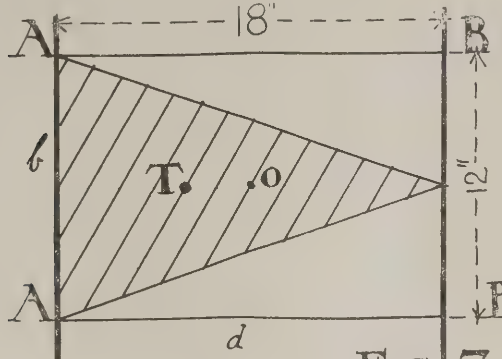


FIG. 7

Fig. 7 is a plan of the joint 1 foot long. The stress at AA is f_0+f_1, and if the material at AA can sustain this stress less of the same material will be required to sustain the diminishing stress towards BB.

At O only half the quantity of material will be required, and at BB nothing is required as there is no stress

The triangle shown hatched-in will represent the material required, the other portion of the wall being unnecessary. (Of course as the material is actually there, the stress will spread itself out over the waste.)

This triangle, seeing that it is capable of resisting the stresses, is therefore the triangle upon which we must depend for the resistance. (If we take any other shape, so as to get a greater stress at say O, the stress at AA will not be equal to f_0+f_1.) Its area is $\frac{bd}{2},$ the total resisting stress is $2f_1 \times \frac{bd}{2}$ and, the leverage being OC $=\frac{1}{6}d$, the moment of the resistance

$$=\frac{1}{6}d \times 2 f_1 \times \frac{bd}{2} = f_1 \frac{bd^2}{6}$$

($\frac{bd^2}{6}$ is called the "Section Modulus" of a rectangular section, and is represented by Z.)

$$\therefore M_T = f_1 Z.$$

It follows that $M_W = f_1 Z.$

$$\text{or } f_1 = \frac{M}{Z} \quad \ldots \quad (2)$$

M_W = W × OC, which is the moment of all the forces about O, and if fig. 1 be referred to, it will be seen that the only force having a moment about O is P.

$$\text{therefore } M_W = M_P = P \times \frac{h}{2}. \quad \text{(\textit{See} paragraph 3.)}$$

$$\text{[From (1) and (2).] } f_0 + f_1 = \frac{W}{A} + \frac{M}{Z}$$

$$\text{and } f_0 - f_1 = \frac{W}{A} - \frac{M}{Z}$$

The formula being generally written:—

$$\frac{W}{A} \pm \frac{M}{Z}$$

the + value being $f_0 + f_1$, and the − value being $f_0 - f_1$.

15.—*The Application of the Formula.*

$$\frac{W}{A} \pm \frac{M}{Z}$$

As an example let us take a wall as shown in fig. 8, length 20 feet, built of hard common bricks, and let us investigate the stresses on the joint AB.

From Table I. we see that the wind-pressure for a wall 5 feet high and 20 feet long is 15.6 lbs. per super foot. Above 5 feet and up to 10 feet high the pressure is 19.5 lbs. per super foot. It will be clearer if we take these two wind-pressures separately, calling their resultants P_1 and P_2, as shown on fig. 8.

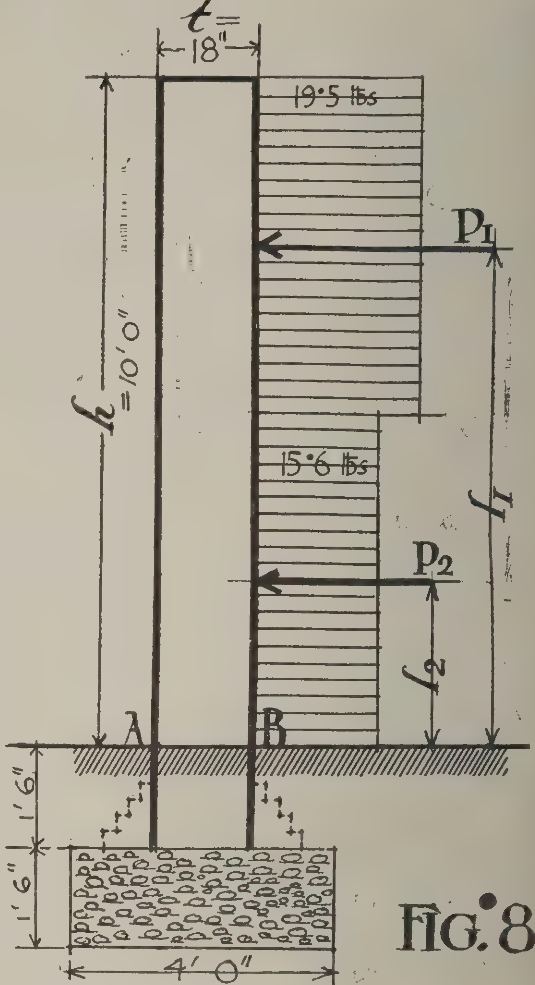

FIG. 8

To make calculations shorter take a 1-foot length of the wall. First find the value of each of the four letters in the formula.

W = Weight of wall above AB.
= Cubic contents in feet × weight per cubic foot.
= 1 × 1½ × 10 × 112 lbs.
= 1,680 lbs.

A = Area of joint AB.
= 1 × 1½.
= 1.5 super feet.

M = Moment of all forces about the centre O of the joint A.B. (Note.—In all unsymmetrical sections of walls, O is the intersection of a vertical line drawn through the centre of gravity of the wall, with the base line A.B.)
= $(P_1 \times l_1) + (P_2 \times l_2.)$ (*See* fig. 8.)
= (19.5 × 5 × 1) × 7.5 + (15.6 × 5 × 1) × 2.5.
= 731.25 + 195.
= 926.25 foot-lbs.

Z = Section modulus.
= $\frac{bd^2}{6}.$ (*See* paragraph 14.)
= $\frac{1 \times 1.5 \times 1.5}{6}$
= ·375 feet units.

Now substitute these values in the formula:

$$\frac{W}{A} \pm \frac{M}{Z}$$

$$= \frac{1{,}680}{1.5} \pm \frac{926.25}{.375}$$

$$= 1{,}120 \pm 2{,}470.$$

The maximum compressive stress f_0+f_1 is therefore
1,120 + 2,470.
= 3,590 lbs. per foot super.
= 1 ton 12 cwts. per super foot,

and this is easily within the safe compression given in Table II.

The minimum compression stress $f_0 - f_1$

$$= 1{,}120 - 2{,}470$$
$$= -1{,}350$$

A negative *compression* means a positive *tension*, therefore the tension at B = + 1,350 lbs. per super foot

$$= 12 \text{ cwts. per super foot.}$$

which is excessive for a common lime mortar joint (*see* Table III.). If this wall is to be built in an exposed position and is to stand by itself it should be built in lias lime mortar, which has a safe adhesion to bricks of 12 cwts. per super foot.

The stress on the top of the concrete foundation must next be ascertained.

$$\begin{aligned}
W &= 11\tfrac{1}{2} \times 1\tfrac{1}{2} \times 1 \times 112 \text{ lbs.} \\
&= 1{,}932 \text{ lbs.} \\
A &= 1\tfrac{1}{2} \times 1. \\
&= 15 \text{ feet super.} \\
M &= (P_1 \times \text{its leverage}) + (P_2 \times \text{its leverage}). \\
&= [(19.5 \times 5 \times 1) \times 9] + [(15.6 \times 5 \times 1) \times 4]. \\
&= 877.5 + 312. \\
&= 1{,}189.5 \text{ foot lbs.} \\
Z &= \frac{bd^2}{6} = .375 \text{ as before.}
\end{aligned}$$

$$\frac{W}{A} \pm \frac{M}{Z}$$
$$= \frac{1{,}932}{1.5} \pm \frac{1{,}189{\cdot}5}{.375}$$
$$= 1{,}288 \pm 3{,}172$$

Maximum compression $= f_0 + f_1 = 1{,}288 + 3{,}172 = 4{,}460$ lbs. per super foot = 2 tons per super foot.

Minimum compression $= f_0 - f_1 = 1{,}288 - 3{,}172.$

$$= -1{,}884 \text{ compression.}$$
$$= +1{,}884 \text{ tension.}$$
$$= 17 \text{ cwts. per square foot tension,}$$

which means that the wall below the ground level must be built in cement mortar. (*See* Table III.)

It will have been noticed that the footings have been omitted. If they were replaced the tension would be decreased.

The calculation of this is left as an exercise for the student.

The stress on the earth below the concrete foundation is found in a similar manner:—

$$\begin{aligned}
W &= 1{,}932 + (4 \times 1 \times 1\tfrac{1}{2} \times 130 \text{ lbs.}). \\
&= 2{,}712 \text{ lbs.} \\
A &= 4 \times 1. \\
&= 4 \text{ super feet.} \\
M &= (19.5 \times 5 \times 10{\cdot}5) + (15.6 \times 5 \times 5.5). \\
&= 1{,}023.75 + 429. \\
&= 1{,}452.75 \text{ foot lbs.} \\
Z &= \frac{bd^2}{6} = \frac{1 \times 4 \times 4}{6}. \\
&= 2.7 \text{ foot units.}
\end{aligned}$$

$$\frac{W}{A} \pm \frac{M}{Z}$$
$$\frac{2{,}712}{4} \pm \frac{1{,}452.75}{2.7}$$
$$678 \pm 538$$

Maximum compression = 1,216 lbs. = 11.7 cwts. per super foot. Minimum compression = 60 lbs., which is a positive quantity, so that there is no tension. If tension had been found the concrete would have had to be increased in size until no tension resulted.

(*To be continued.*)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Election of Licentiates.

At the Council meeting of July 20, the following candidates were elected Licentiates R.I.B.A., in accordance with the provisions of By-law 12:—

Frank Abbey, John Sheddan Adam, James Montgomerie Alexander, Henry William Allardyce, Frederick John Almond, William John Almond, William Herbert Alton, Herbert Ambler, Arthur E. Anderson, Frederick William Anderson, John Anderson, Geo. Anderton, Robt. Angell, Tho. Graveley Angell, Alfd. Appleby, Arthur Appleby, Clive Ewart Ardley, John Armstrong, John Arthur, John Maurice Arthur, William Harry Ashford, Charles James Ashworth, Norman Henry Atkins, Herbert Evans Ayris, Harry Edwin Baker, Richard James Baker, Frederick Ball, Walter John Raymond Barker, John Barlow-Smith, Alfred Henry Barnes, Charles Aubrey Bassett-Smith, Roger Beechworth Batchelor, Roderick Hildyar Baxter, Richard George Beard, George Nicholas Beattie, William Beattie-Brown, Arthur Fred Collins Bentley, Ernest Edward Bentley, Robert Bentley, Frederick Fox Beaumont, Henry Stratford de Bertodano, Charles Henry Biddulph-Pinchard, Ernest Frank Stuart Biram, Percy John Black, John Thomas Blackwell, George Henry Blagrove, William John Blain, William Wallace Blair, Alfred William Blomfield, Henry Charles William Blyth, George Arthur Boswell, George Pigrum Bowie, William Craig Boyd, Henry Bragg, Henry Creswick Wilson Brameld, Arthur Owen Breeds, George Woulfe Brenan, Horace George Charles Brewer, Thomas Mortimer Bricknell, Thomas Ridgway Bridson, Fred Broadbent, Francis William Brook-Greaves, Alfred Brown, Alfred B. Brown, John Brown, Philip Ernest Brown, Flint Browne, Donald Bruce, Frederick Septimus Brunton, George Ronald Bryce, Andrew Francis Stewart Bryden, Robert Edward Bryson, William Henry Buck, Ernest Havergal Bullock, John Godfrey Bune, Charles Frederick Burden, Stanley Harry Burdwood, Harold Thomas Burgess, Julian Gulson Burgess, John Edward Burton, Edwin Bush, Ernest Newman Butler, Thomas Butterworth, Charles Vincent Cable, James Davidson Cairns, Robert Macfarlane Cameron, David Williamson Campbell, Hugh Campbell, Wilfred Tom Campsall, Bingham Carre, William Arthur Laurie Carrick, James Carruthers, Ronald Carswell, Thomas McGill Cassels, Frank Catling, Arthur Charles Albemarle Cator, Frederick Chambers, Harold Griffith Cherry, James Christie, James Arthur Chubb, Joseph John Clark, Harold Forbes Clark, William Clarkson, Thomas Keightley Cobb, James Cobban, Alfred Myddleton Cock, Joseph William Keal Codrington, Joe Collins, William Constable, Percy Rogers Cooke, George Cooper, George William Cooper, George Donaldson Copland, James Noble Cormack, Grahame Cotman, John Sewell Courtaul, Charles H. Cousins, Herbert Lee Cowell, George Craig, James Hoey Craigie, Andrew Rennie Crawford, Frank Cremer, James Gregory Crisp, Christopher Croft, John Burns Cromb, James Crossland, Albert Edward Cuddy, Andrew Culpan, Thomas Hethorn Cunliffe, Samuel Baikie Cunningham, Harold Wynne Currey, David Matheson Cuthbert, Hugh Dan, Arthur Richard Dannatt, Roger Thomas Davey, Alexander Davidson, George Davidson, John Davidson, John Davis, Henry Holmes Dawson, Henley Dawson-Pearce, Benjamin Sagar Dean, Herbert Denton, Alexander Cumming Dewar, George Sylvan De Wilde, Ernest Charles Rowe Dibdin, Henry Huntingdon Dodd, Leslie Sydney Dodgshun, Sam Dodson, Thomas Tyssen Grey Donaldson-Selby, Ernest Gordon Ross Downer, William Basil Yeatman Draper, Edward Drew, William Driffield, Alan Ferguson Duncan, William Liddle Duncan, Edward Ford Duncanson, William John Dunham, John Glen Dunn, Edward Ford Durlacher, Austin Durst, Thomas Dykes, Vernon Annesley Edlin, John Ellis, Francis Beaumont Ellison, Robert Kitching Ellison, John Eltringham, Henry Alfred Emmett, Ernest Sugden England, Harry Launcelot Etherington-Smith, George De Lacy Evans, George Vincent Evans, John Morlais Evans, Norman Evans, Walter Fairbairn, George Farquhar, Percival Inglis Farrer, James Newton Fatkin, Frederick Fenn, William Ferguson, Harry Reginald Finn, William Henry Fleeming, George Granger Fleming, Francis Hayward Floyd, Alfred Forrester, Francis Roland Foster, Thomas John Fox, Harry Foxall, James Harold France, Herbert Frost, Willford Arthur Gagnon, Ernest Sewell Gale, Wm. Willis Gale, John Hinton Gall, John Thos. Galletly, David Wishart Galloway, Wm. Gannon, Hubert McBain Gardiner Garden, Alex. Gardner, Alex. McInnes Gardner, Gilbert Thomas Francis Gardner, Thomas Merrison Garrood, Clement George, Wilfred Harold George, Rajendra Chandra Ghose, William Garnett Gibson, William Stephen Gibson, William Ernest Gill, James Gillespie, James John Glendinning, Frederick Forbes Glennie, James Hugh Goodman, Henry Robert Goodrham, John Proudfoot Goodsir, Alexander Laurie Goodwin, Frederic Arthur Gosling, John Henry Charles Gosling, Patrick H. Graham, Andrew Grant, W. Grayson-Brown, David Frederick Green, Herbert Percy Green, Alfred Greig, Henry Sandham Griffiths, Thomas Henry Griffiths, Walter Austin Griffiths, Kershaw Grimshaw, Arthur Grove, Richard Thomas Grove, Alfred Fowler Gutteridge, George John Hagger, Douglas Pairman Hail, Amos Hall, Charles Russell Hall, Herbert W. Harding, H. R. Harding, C. René Harrison, Edmund James Harrison, Frederick Harrison, John Edwin Harrison, Louis Harrison

Reginald Arthur Victor Harrison, George Alfred Hartley, Edward A. B. Hay, Benjamin Haylor, John Black Hector, D. Easton Herrald, Arthur George Hewlitt, Herbert Hicks, Ernest James Wedlock Hider, George Harry Higginbottom, Francis Coleman Higgins, Henry Edward Higgins, Thos. Jackson Hill, John G. Hindmarch, Victor Tylston Hodgson, George Spencer Hoffman, William Johnston Hogg, William Pearson Holgreaves, Alwyn Henry Holland, George Edward Holman, George Dominic Holt, Percy Yell Holway, Ernest Fray Hooper, Arthur John Hope, Thomas Baptist Horsfield, William Houlker, jun., John Winnall Hoult, Fred Howarth, William Holmes Howie, Arthur James Hoyland, David Hucker, Arthur Huddart, Arthur Ernest Hughes, William Alfred Hughes, Edwin Hulme, Herbert Salmon Hunt, John Marshall Hunter, Frederick James Huntingdon, Frederick Arthur Huntley, John Hutton, Ernest Stanley Iles, Alexander Inglis, Herbert Clavell Ingram, Benjamin Robert Irvin, Sydney Alexander Jackson, Alan Gossett James, John Stirling Jarvie, John Jennison, John Jerdan, James V. Johnston, Joseph Marr Johnston, Francis Jones, jun., Robert Cadwaladr Jones, William Alban Jones, Sidney Thomas Jordan, John William Juritz, Claud John Kay, Charles Henry Kempthorne, William James Kennedy, Arthur Kent, James Kerr, Thomas Kerr, William Alexander Kidd, George William King, John King, Albert Holmes Kirk, Walter Kirk, Frederick Louis Klingender, Harry Lethbridge Knapman, Wm. Rudolph Waldemar Koch, Arnold Woodrow Kyle, Arthur Ernest Lacey, James Austin Laird, Wilberforce Page Lambert, John Lancashire, Claude Stephens Langham, William Langley, Frank Lansdown, Ezra Lavenstein, Charles Alexander Lawrence, Charles Ernest Lawrence, Sydney H. Lawson, Wilfred Lawton, William Leah, Montagu William Leman, Thomas Melville Leman, Gavin Lennox, John Milne Lester, Thomas Hollins Letts, John Martin Lewis, Lewis Lewis, William George Lewton, Alexander Lickely, James Aynsworth Lindsay, Roland Walter Lines, Edward William Lister, Thomas Gerard Lister, Tom Curry Little, Frederick Howard Livesay, Edwin Ambrose Lloyd, John Whitelaw Lockhart, Percy Dean Lodge, Thomas Munro Logan, Alexander Lorimer, Thomas Loveys, George Cecil Lowbridge, James Lowe, Frederick Lowry, George G. Lynes, David McArthy, William Mackay, Andrew McKinlay, Chas. John MacLean Mackintosh, James McKissack, James M'Lachlan, Peter Robert McLaren, John Duncan MacLeod, Daniel W. MacMath, Alan MacNaughtan, George Donaldson Macniven, Alexander McRae, Ebenezer James MacRae, John Alexander McWilliam, Edward Charles Henry Maidman, Alexander Nisbet Malcolm, George William Manning, William Charles Manning, George Frederick Maskelyne Marriman, Charles Frederick Marston, Herbert William Henry Marston, Thomas Craigie Marwick, Malcolm Waverley Matts, Thomas Frost May, John Henry Maybury, R. Yates Mayor, Ernest Meggitt, Joseph Abraham Meikle, George Scott Miles, Thomas Andrew Millar, Charles George Miller, Harold Victor Milles-Diamond, Evan Holford Mills, Alexander McGregor Mitchell, Henry Mitchell, Robert Matthew Mitchell, Bowland Brockman Moffat, Ernest Edward Moodey, Edgar Percy Morgan, Wilmot Banks Morris, James Inch Morrison, Latto Alexander Morrison, Robert Reginald Morton, Henry Hayward Moye, Walter David Murdoch, Bailey Scott Murphy, Thomas Henry Murray, Joseph Robert Musto, Legender William Myers, Hamilton Neil, Augustus William Newman, John H. Nicholls, Edgar Charley Nisbet, John Bryan Nisbet, Hamilton More Nisbett, Geoffrey Norman, James Herbert Norris, Henry Nowill, Arthur Nunweek, Jack Learmonth Ochiltree, Herbert Ogden, Gilbert F. M. Dust and Fire-Resisting Museum Cases.

Sir,—I am much interested in this subject, and have lately been discussing same with directors and curators of several museums; and it appears that Delta bronze cases as already installed in several museums are far preferable to steel coppered, &c., as described. The Delta bronze is fireproof, and will not rust, and can be made in beautiful sections of very smooth finish; and if cost is a consideration light Delta bronze sections can be rivetted to steel frames.

This method, I am informed, is as cheap as mahogany and plate-glass. I have lately been shown some places where this bronze has toned down to a lovely colour. I am quite sure the matter is worth English show-case makers specialising in, as there is a growing desire for a change from the monotonous black heavy wood cases.

Thanking you for your courtesy in permitting space, yours truly,

H. Bartlett.

FORTHCOMING EVENTS.

Saturday, August 19.

Manchester Society of Architects : Visit to Chester Cathedral and Eccleston church (the late G. F. Bodley, architect).

Architectural Association : Excursion of Camera, Sketch, and Debate Club to Holland House.

Thursday, August 31.

Guild of Architects' Assistants : Visit to Victoria Palace, Victoria, S.W. (Messrs. Frank Matcham & Co., architects).

Saturday, September 2.

Northern Architectural Association : Students' Sketching Club.

Architectural Association : Camera, Sketch, and Debate Club, visit to Zion House.

R.I.B.A. SECOND REPORT ON REINFORCED CONCRETE.

ALTHOUGH we are still far removed from a complete knowledge of all that appertains to the use of reinforced concrete in building construction, either as to the stresses and strains that occur under loading or as to the relationships that exist between various forms or kinds of material, our acquaintance with the latest vogue in building construction has become more intimate, both from practical use and from careful research on the part of many experimenters.

Therefore the first report of the Joint Committee on Reinforced Concrete, organised by the Royal Institute of British Architects, which appeared in 1907, is now by way of becoming out-of-date, in the light of further experience and the increased use and knowledge that have been rapidly developed since that date.

The introductory note states that the section on materials has been modified in certain details; the section on methods of calculation has been recast in form, and the standard notation (proposed by the Concrete Institute) has been adopted; the sub-section on columns has been revised and the formulæ proposed have been recast so as to include the cases in which the lateral or helical binding is a material factor in the strength. We need not further trouble ourselves with a comparison between the first and second report, but deal with the latter on its merits.

Throughout the report there are two notable features. First, the pronouncements of the report are *ex cathedra*, the reasons for the recommendations made and the experiments or theories on which the reasons are based being generally omitted. Second, there is repeated admission that as to various matters satisfactory theories and trustworthy experiments are up to the present still lacking. With the first of these features of the report little fault need be found, since the omission to which we have referred makes for brevity and conciseness, whilst the composition of the Joint Committee is such that an authoritative pronouncement may be readily accepted at their hands. The acknowledgment of insufficient data when such occur is evidence of trustworthiness in the recommendations that are made. The adoption by the Committee of the standard notation proposed by the Concrete Institute is a wise step, for even if this notation is not the best possible in the opinion of some writers and students, it is a great point to have a standard notation, even if it is not a perfect one.

After a right insistence on the necessity of careful workmanship in the execution of reinforced concrete, and an expression of opinion that all building by-laws should recognise this form of construction, the report deals with the question of fire resistance. Here we think a mistake has been made in describing the peculiarities of concrete in which coke-breeze, cinders, or slag form the aggregate, when a foot-note on the next page correctly bars its use for reinforced concrete. The fire-resisting qualities of a concrete that must not be used is a subject beyond the proper scope of a report on reinforced concrete.

We cannot approve the Committee's recommendation of the thickness of protection to metal "in all ordinary cases," whilst stating that "more perfect protection" is required "under very high temperature" and "in the most severe conditions." Such teaching ignores the circumstances of every fire in a building. There is no assurance that in any particular case "the most severe conditions" may not be locally developed. Cast iron may be melted in a fire from which wooden furniture may escape with no more damage than the blistering of paint.

In their recommendations as to materials, we think there is still more to be said than that 75 per cent. of the sand should pass ⅛-inch square mesh. In saying that "fine sand alone is not so suitable," what do the Committee mean by "fine sand"? We want the size of mesh on which the bulk of the material that passes the ⅛-inch mesh is retained. With regard to the aggregate the maximum allowable size of ¾-inch would not be very suitable for a cover of ½ inch to the metal in slabs elsewhere stated to be sufficient, a practical reason, in addition to the function of fire-resistance, why we do not agree with the Committee's recommendation.

If "in all cases the proportions of the cement, sand and aggregate should be separately specified in volumes," it seems to us that an explanation is desirable why "the amount of cement added to the aggregate should be determined on the work by weight." We think it would have been better for the report to have omitted all reference to water-tightness of concrete unless the subject, which is not a simple one, had been more fully treated. One-part cement to two-parts sand does not always make a "practically water-tight mortar," and there are other methods of making concrete water-tight than increasing the proportion of cement.

We should have liked to see a recommendation for the use of a larger proportion of cement when hand-mixing is necessary, even though the report says that "whenever practicable the concrete should be mixed by machinery." Further details of points requiring care in the use of centering or casing are desirable, particularly with regard to the construction and use of moulds for columns.

In the section of the report dealing with methods of calculation we fancy that by a printer's error the bending moments are recommended as not less than $\frac{wl^2}{12}$ instead of $\frac{wl}{12}$. We are somewhat surprised that whilst beams with single reinforcement are dealt with comprehensively no reference is made to beams with double reinforcement. Possibly the Committee consider that systems which adopt such reinforcement are not desirable from the point of view of economy, for they give a relation between the allowable stress of steel in compression, and that in the surrounding concrete, so that it is possible with the report in hand to deduce formulæ for double reinforcement.

With regard to slabs supported or fixed on more than two sides, the report states that "it does not appear that there is either a satisfactory theory or trustworthy experiments from which the strength of rectangular slabs supported or fixed on all four edges can be determined," but in the appendices to the report is given a statement of some rules which have been used in determining the strength of slabs. The appendices, by the way, are not the least useful portion of the publication containing the report, and a careful study of these makes clearer some of the unexplained statements and recommendations in the report itself. On the subject of the strength of rectangular slabs we have an appendix on "the strength of rectangular slabs" by Mr. E. F. Etchells; another on "Bach's theory of the resistance of flat slabs supported on all edges and uniformly loaded," by Professor W. C. Unwin; and a third giving a "comparison of the results given by various rules for the strength of flat rectangular slabs supported on all edges and uniformly loaded," by Mr. William Dunn.

Thus the Committee, whilst not committing themselves to an expression of opinion on a difficult and indeterminate question, puts us in possession of the most plausible answers. In dealing with shear reinforcement the report hardly, we think, makes it sufficiently clear that diagonal tension is really the stress that has to be met: hence that vertical shear reinforcement, although, in our present state of knowledge, more readily calculable, is not strictly logical and scientific.

We presume that in their imprimatur on the strength of hooped pillars the Committee are justified by the result of careful and reliable experiment, and on that presumption their recommendations are clear and precise. We rather doubt whether, having regard to the many contingent conditions that make for perfection in pillars, a safety factor of 4 is sufficient for everyday practice.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

THE forty-second annual excursion of the Architectural Association is during this week in progress, the valley of the Loire being the district chosen for the scene of study.

On Friday night last twenty-seven members crossed to France by the Dover and Calais route and travelled to Paris, sleeping, more or less, on the train. A short three hours in Paris did not give more than sufficient time for crossing from the Nord to the Quai d'Orsay station, transferring baggage, and a *petit déjeuner à grand prix*. Then a hot journey of three hours by the Paris-Orleans railway brought the excursionists to Blois, where the headquarters were to be fixed at the Hôtel de France for the first few days.

The afternoon of Saturday was spent in a formal visit under the normal tourist conditions to the Château of Blois, and the cicerone entertained the party with a graphic description of the murder of the Duc de Guise and of the Cardinal of Lorraine in December 1588. The interior of the château has been restored and redecorated, under the direction of M. Duban and M. de Baudot, to a presumed reproduction of its condition in the time of Henri III.

The oldest part of the château includes the thirteenth-century Salle des Etats-généraux, which were held here in 1576 and 1588 under Henri III. To about the same date belongs the Tour du Moulin or des Oubliettes, wherein the Cardinal of Lorraine was imprisoned and assassinated. This tower has, however, been enclosed with galleries in the sixteenth century. The chapel and east wing, with the principal entrance, were built by Louis XII. in the Flamboyant period, of which it is one of the best examples of domestic architecture. The north wing was erected for François premier, and is an equally characteristic example of the earliest Renaissance. Then the west wing was added under François Mansart for Gaston d'Orléans, brother of Louis XIII., but not quite completed internally in consequence of Gaston's death in 1660. This wing replaced that constructed by Charles d'Orléans, father of Louis XII.

In spite of the restorations of Duban, there is still much to be seen inside the building of the original construction, chimney-pieces, panelling, tiled floors, and some little stonework, but it is on the exterior that most fascination for the architectural student is to be encountered. Whether the Flamboyant Gothic of Louis XII., the Early Renaissance of François I., for whom Jacques Sourdeau and his son Denis acted as masters of the works, or architects, and the later Renaissance of François Mansart for Gaston d'Orléans, each is good of its period, and there can be no hesitation for the student in making choice of something to study.

From the ramparts of the château can be obtained good views of much of the city of Blois, with the Loire, the church of St. Nicholas, and the distant watershed. The church of St. Nicholas was built between 1138 and 1210 for a Benedictine foundation, and contains much interesting Early, almost Byzantine, detail, as well as good First Pointed work.

The cathedral of Blois, dedicated to St. Louis, is of sixteenth-century date, partly rebuilt under Louis XIV. in 1678, and is rather curious than beautiful. The portal is Renaissance, and the tower at the left of the west front, although retaining some twelfth-century work in its lower stages, was built between 1544 and 1609. The bishop's palace, of which Gabriel was the architect, under Louis XIV., has a beautiful terrace, which now is a public promenade, and from which fine views of the city and its surroundings can be obtained. Other ecclesiastical buildings in Blois are the churches of Saint-Vincent-de-Paul, a Jesuit church built between 1626 and 1671, and Saint-Saturnin, in the suburb of Vienne, on the opposite side of the Loire.

Sunday morning was spent by the excursionists without fixed programme in wandering through the city, visiting the cathedral and other churches, or studying and resting in the shade at the château, for Blois was in possession of a fine example of heat wave. Blois contains many examples of interesting old houses, notably in the rue Saint-Honoré and the rue Saint-Lubin.

On Sunday afternoon a drive was taken by most of the party to the small Château de Villesavin, which, as an inscription on the garden front informs us, was built in 1537 by N. Le Breton, Sieur de Villandry, Secrétaire des Finances du roi François I$^{\text{er}}$.

> "D'une grande forêt un petit bois voisin
> Ici, vit autrefois naître Villesavin
> Qui, bien qu'ayant subi des ans le long outrage
> Orne encor du Beutron le champêtre rivage."

As a further legend reminds us, "de l'art qui décorait les palais des Valois dans un humble essor apercevez les lois," we have in this little château an exemplar of the architectural treatment of greater palaces in the time of François I. The house itself is L-shaped on plan, but an entrance courtyard is cleverly formed by a division-wall to the farmyard, terminated by a small chapel to balance the end of the opposite wing. The building is practically only of one storey, with a steep roof, in which dormer windows of rich detail give piquancy and character to the design. The garden front has a projecting porch, with steps leading up to the principal or ground floor. Altogether the visit to Villesavin formed a good introduction to the more important châteaux of the Loire to be visited during the week. On the return to Blois, a short stay was made at Chiteau, which has a picturesque church.

(To be continued.)

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

(Continued from last week.)

THIS year the summer meeting of the Royal Archæological Institute falls into two divisions, viz. the opening five days, when Cardiff served as a centre, and the remainder of the time, when Tenby was the headquarters. It was a wise decision which made the organisers conclude with the latter town, for on looking back memory will rest so happily on the breezy cliffs of Tenby, with their glorious panoramas, as to obliterate the discomforts of the preceding days, when Cardiff seemed like a baker's oven to pilgrims weary after a day's strenuous sightseeing. Tenby is beautifully situated on Carmarthen Bay, slightly over a hundred miles distant by train from Cardiff. Nature was prodigal when endowing the town with beauty, and showed special favour in presenting her with an ever-changing sea palette.

It is historic ground, too, for though the written page may not have stirring events to show of Tenby, there is still the strong town wall gravely standing guard as it has done for five centuries. In some respects the town is almost a world unto itself. We cannot do better than quote the following succinct account of the town and district given to the members by Mr. Edward Laws, F.S.A., of Tenby:—

BELMONT TOWER, TENBY

The visitor to Tenby is neither in England nor Wales, but in little England beyond Wales. Its existence came about in the following fashion. Very soon after the Norman Conquest certain adventurers, by reason of their mastery of the sea, settled themselves in Pembrokeshire, built castles, and established a strong base from which they could thrust into the heart of Wales. From this same base Ireland also was invaded. But, owing to this latter movement, Pembrokeshire was so depleted of its men-at-arms that the Welsh rose and burnt Tenby, and it lay waste for over half a century. Then King Henry II., seeing that a strong man was necessary, gave the earldom to William Marshall, and the government became a Palatinate. Under the Marshalls, De Valences, and Hastings, the Palatinate was pretty well independent. The King's writ did not run here. But when John Hastings the Younger was killed in a tournament in 1389 King Richard II. murdered Edward Hastings, the heir, and made his queen Countess of Pembroke. This broke up the Palatinate, though there followed notable earls like Humphrey of Gloucester and Jasper Tudor.

The jurisdiction in the county was very peculiar. South Pembroke was ruled from the Palatium of Pembroke. Haverfordwest was a lordship more or less independent, of which the queen consort was generally lady. Deurland, or St. David's land, was under episcopal jurisdiction. Cemmaes was a march ruled by a Lord Marcher, who, by the way, survives in the person of Sir Marteine Lloyd, he being the only Lord Marcher extant. As may be supposed, these various and often hostile communities were a happy hunting-ground for rogues; a gentleman in trouble slipped from one of them to another with the greatest ease. If he was very hard pressed he sought hospitality from the White Knights of St. John of Jerusalem at Slebech, informing them that he was a Christian in distress and demanding sanctuary from them in performance of their vows. So the good hospitallers had to take him and look after the stolen cows. Church matters were also affected by the Palatinate. In very early days Arnulph de Montgomerie gave Monkton church to the Abbey of Seez, and it became an alien priory. As home church of the Palatinate one might expect to find a building such as Tintern, the earls being powerful, rich and pious. Nothing of the sort ever existed. They did endow the priory with all the Church patronage on the south coast of Pembroke from Angle to Longhouse. But they never spent much on its adornment. As an alien priory it was half its time in the hands of the Crown, which led to innumerable squabbles between king and earl. When Henry V. finally seized the alien priories for good, his brother Humphrey, as earl, demanded and got the priory of Monkton, with its dependencies; these he gave to his friend, the Abbot of St. Albans.

The town of Tenby has, it will thus be seen, no slight claim to be regarded as of considerable historic importance. Its walls are in a remarkable state of preservation for the most part on the two most important sides.

TENBY.

The official meeting of the Archæological Institute was resumed on Monday, July 31, when a short formal reception was held at the Town Hall by the Mayor and Corporation. This was followed by an inspection of the walls, under the guidance of Mr. Edward Laws, F.S.A., who has made a special study of the subject and written a series of papers for *Archæologia Cambrensis* dealing with their complete circuit.

The military architecture of Tenby is divided by Mr. Edward Laws, F.S.A., into five periods: (1) Such works as were in existence before Tenby was a walled town. These are on a headland called Castle Hill, and perhaps belong to the twelfth century. (2) Towers, gates, curtains, encircling the town, probably built by Earl William de Valence (1275-1300). (3) Additions to and enlargements of these in 1457 by Earl Jasper Tudor. (4) Elizabethan restorations, 1588. (5) A few unimportant alterations made between 1643 and 1648. On the land side the defences are still almost complete. They commence at the north gate (also known as the Great or the Carmarthen Gate), overlooking the sea, but which is now the site of the Royal Lion Hotel. The wall ran for fifty yards to a corner bastion. This part of the wall was originally about 18 feet high on the outside and 13 feet on the inside, with one line of loops. Behind was a masonry walk 4 feet 6 inches wide and 8 feet high, from which to serve the loops. In 1457 Earl Jasper raised the height of the wall, including the crenellation, to 25 feet, and also raised the masonry platform to 13 feet 6 inches. Although he thereby covered up the lower loopholes he substituted a higher series of loops. At the semicircular bastion the wall turned at right angles, and still goes in an unbroken straight line over 20 feet in height for more than 400 yards to the sea. Including the two corner ones there are now seven bastions along it. The most important is, and always was, the south-west gate, or "Five Arches," in the middle, the last noble survivor of the five gates which once defended Tenby. The internal area of this semi-circular bastion is 40 feet by 20 feet. It is worth mentioning that in 1873 the Corporation ordered the gate to be removed, and, in fact, the materials had actually been sold. Fortunately a local doctor bestirred himself so effectually that an injunction was obtained in the Court of Chancery to prevent this act of vandalism being carried out then or at any future time. These two sides of the wall were defended by a moat 30 feet wide, which was for the greater part dry. When the wall had reached the high and rugged cliff it turned north again, following the irregular line of the shore with a somewhat weaker line of defence. In several places this portion has disappeared. About in its centre stood Brechmaenchine (or the Chine of the Spotted Stone) Tower. This name has been locally adapted in the case of the flight of rough steps leading to the shore to "Break Man's Shins." Where the wall came to a narrow neck of land leading to Castle Hill it turned once more so as to link up with the northern gate. Here again the line of walling only remains in short lengths.

The Castle Hill is a separate fortress, forming, as it were, an inner bailey round the little Don, while the town, encircled by its walls, completed the arrangement as an outer bailey. The Castle Hill was under the jurisdiction of a military governor.

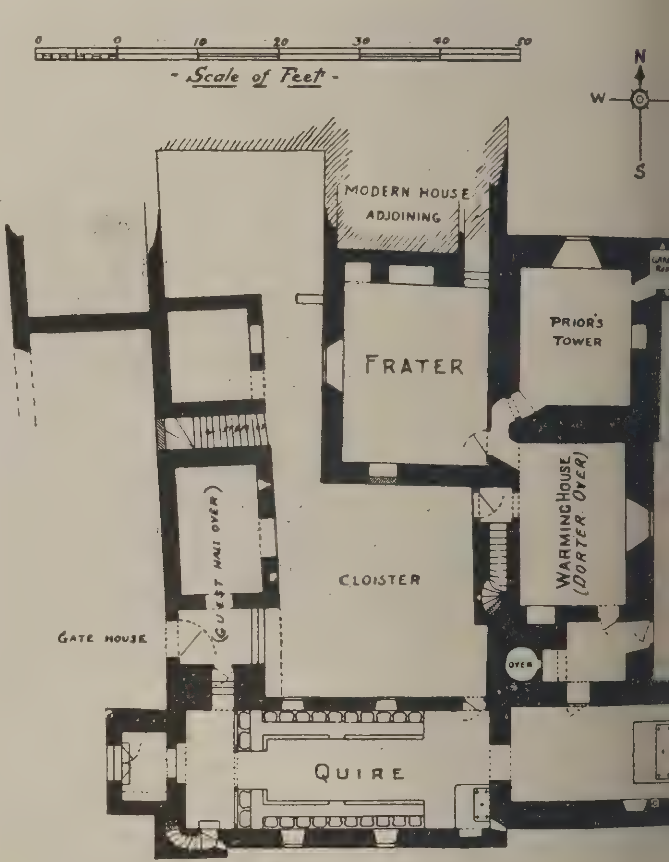
After perambulating round these defences a move was made to the Town Hall. At the reception the Mayor had given the Archæological Institute an invitation to accompany him when he opened in state St. Margaret's Fair. This is a ceremony of no little local importance, and always takes place on the last day in July. The procession started out from the Town Hall headed by a brass band, next came a mixed collection of citizens, archæologists, town councillors (resplendent and conspicuous in tall hats), mace-bearers, town crier, aldermen and Mayor, and ended with more archæologists and more townsfolk. At certain intervals the procession halted so as to allow the crier to ring his bell and announce that the fair was now open, and would continue for three days by royal charter of Queen Elizabeth, and that if any grievances arose a *pied poudré* court would be held by the Mayor and magistrates to redress the same. On arrival at the fair ground the procession lost some of its dignity in a general scramble to get a seat on the switchback roundabout, which gave a gratuitous preliminary journey. Fortunately the Mayor in state, the mace-bearers, and many of the councillors were found accommodation. And so, too, were some of the members of the Royal Archæological Institute who were able to successfully challenge the pressing claims of less official partakers in the ceremony.

Tenby Church.

The church at Tenby is a capacious one; in fact, with the exception of St. Davids Cathedral, it is the largest in Pembrokeshire. It is now dedicated to St. Mary, but Mr. Laws, in his account of the building, suggested that its original dedication was to St. Bridget, as St. Mary was not very popular among the Welsh as a patroness, being distinctly a Norman saint. In 1186 the church that stood on the site of the present south aisle was destroyed, with a considerable part of Tenby, by the Welsh, who "by plain force won the town and burned it to ashes." The excrescent wall on the west side of the tower is thought to be part of the old church, which probably had a chancel where the tower now stands. It lay in ruins until 1245, when Warine de Munchensy rebuilt it. He had married Joan Marshall, and though it is very doubtful if he was ever elevated to the earldom of Pembroke, he enjoyed Palatinate powers in right of his wife. His additions seem to have been the tower, nave, both aisles and the chancel. He covered them with a vaulted roof, remains of which may be seen, though none of his pillars exist. Guy de Brian, one of the early Garter Knights, and a mighty church-builder, seems to have had a hand in building Tenby Church. He probably built the spire, St. Anne's Chapel, and altered the chancel roof. But the existing structure owes most to the Perpendicular architect who had a long lease of power in Tenby Church. He widened the south aisle, he remade all arches and piers in the church, built a north chancel aisle which was used as a baptistery, raised the high altar by a flight of eleven steps, and covered the original altar space so as to make it into a crypt chapel, and levelled the floor of the church. A remarkable feature is the west door, originally the inner door of a great cruciform porch erected in 1490 at the same time as St. Mary's College, which once stood in the churchyard. Other notable features of the structure are the west windows, the wooden roof of both choir and nave (dating from about 1470), and the monuments. Professor Freeman admired Tenby Church "both on account of its architectural features and by reason of its rich store of monumental antiquities." The most elaborate of the latter are two tombs of late fifteenth century merchants, father and son, each with their two wives, who were of considerable importance in Tenby. The earliest monument is to the east of the north entrance, and shows the figure of a woman (probably the wife of a governor) under a cinque-foiled canopy. A modern slab has been put up to commemorate Robert Recordi, who "was born in Tenby about 1510, and to whose genius we owe the earliest important English treatise on algebra, arithmetic, astronomy, and geometry. He also invented the sign of equality (=) now universally adopted by the civilised world. Robert Recordi was Court Physician to King Edward VI. and Queen Mary. He died in London in 1588 in prison."

Caldey Island.

This island stands about one mile as the crow flies from Tenby, and the journey to it was made by a small steamer. It is, as the members were told on landing, an island with a history behind it. Relics of pre-historic days exist in the kitchen middens and bone caverns. The first mention of Caldey is in the "Acta Sanctorum," parts of which at least are accepted as trustworthy bits of history. One of these is the life of St. Samson (495-564), the second abbot of Caldey and Bishop of Dol. At that time Caldey seems to have been attached to the University of Llantwit Major, of which St. Illtyd was abbot. In the sixth century there was here a Celtic monastery of considerable importance, with which the names of St. Pol de Leon, St. Brieuc, St. Gildas (the historian), and St. David are associated. Of that period the most interesting relic is the ogham stone now in the Priory Church. In 1120 the island was given to the Benedictine monastery of North Pembrokeshire. The Celtic foundation had expired more than a century previous, possibly owing to the incursions of the Danes, who in 997 burned the monastery and murdered the bishop and monks at St. Davids. The Benedictine cell, of which considerable remains exist, was probably erected on the site of the previous buildings. Provision was made against the attacks of pirates, who for a long time were a constant menace. At the time of the Dissolution the island was purchased and turned into a farm. In 1897 it came into the possession of Rev. W. Done Bushell, F.S.A., and five years ago it became the property of a community of Benedictine monks of the English Church.



CALDEY PRIORY.

The inhabited portion of the island may be said to be on a gradual sloping plateau running from Priory Bay on the north side to Chapel Point on the south. We reproduce a conjectural plan of the Priory. The fourteenth-century tower at the west end of the choir has a curiously shaped spire, and is out of the perpendicular owing to a settlement of the foundations. The ogham stone in the church is said to bear this Latin inscription: "With the sign of the Cross of Jesus I, Illtyd, have fashioned (this monument). I ask all who walk in this place to pray for the soul of Cadwgan." The remainder of the priory buildings have been altered almost out of all recognition, but the little courtyard or cloister is at any rate picturesque. The village church of St. David stands well away from the priory, and may or may not be of Celtic origin. Of course, at the Dissolution it fell into ruins. Seventy years ago it was adapted for the purposes of a school, which was an improvement on its previous use as a blacksmith's shop. As it stands to-day the building does not arouse much architectural enthusiasm. It is far less interesting than the piquant priory church already described, which has wonderfully survived its uses as a brewery, laundry, and lumber-place.

CAREW CASTLE.

But Caldey Island is for the living as well as for the dead. The brotherhood to whom it belongs are endeavouring to recreate mediæval monastic life in the twentieth century. At present they number, we believe, about thirty. The public are forbidden access to the monastery precincts, but on the occasion of our visit the detached monastery church was thrown open so as to enable the beautifully fitted choir to be seen through the open screen. The buildings erected by the brotherhood for their personal use and for the benefit of those on the island are from the designs of Mr. J. Coates Carter, and are highly interesting. At present their white walls and red roofs are somewhat over-bright, but these qualities will soon be lost even at Caldey, where the climate is so mild as to allow wild fuchsia to grow in abundance. It may be mentioned that the building work is not let out on contract, as it has proved more satisfactory to employ the men directly, under the surveillance of a clerk of works and under the watchful eye of Mr. Coates Carter.

PEMBROKE CASTLE.

The Island of Caldey, serenely standing in the world and yet not of it, ought to bring repose to troubled souls. And it was fitting to leave not with the blatant notes of a German band, but with the gentle sound of a carillon ringing in one's ears.

In the evening a conversazione in the Assembly Rooms was attended by the members of the Institute by invitation of Captain Hughes Morgan, the Worshipful the Mayor of Tenby. The two handsome silver maces, with several charters and other documents, were displayed. Mr. Edward Laws, F.S.A., and Miss E. H. Edwards also showed prints, drawings, and other objects of local antiquarian interest.

Tuesday, August 1.

CAREW CASTLE.

A picturesque motor drive of six miles brought the members and their friends to Carew. The first object to attract attention was a remarkably perfect cross standing on a new stone platform by the roadside, near the entrance to the castle. Mr. Edward Laws said the cross resembled one seen on the excursion to Llantwit Major; but it was even more like those at Nevern, Pembrokeshire, and Golden Grove, Carmarthenshire. The late Mr. Romilly Allen (than whom there was no greater authority on inscribed work) considered that all these were designed by the same artist, and that they had much in common with the crosses of Devon and Cornwall. Mr. Allen and Sir John Rhys are agreed as to the curious incised lettering of the inscription, which runs thus:

MARGIT
EUT RE
CETTF.

and translate it as: "Margiteut of Rhyed made it." There are replicas of this inscription cut on a stone in co. Wexford, and another on Fethard Castle. It is believed to be of the ninth or tenth century. The cross stands about 14 feet high, and the shaft is covered with panels of knotwork pattern. According to Mr. Allen three typical forms of ornament occur on all the Welsh crosses mentioned above:

"First a square divided diagonally and filled with an L-shaped fret; second, two oval rings interlaced crosswise; third, a square with four T's arranged like a Chinese swastica."

Carew Castle, as will be seen from the view we give, was a robustly-built structure. The name is locally pronounced "Carey," and is derived from the plural of the Welsh Gaer or Caer, which means a camp, spelt Caerau. This word the English long ago decided to pronounce "Caroo." From this castle, said Mr. Laws, sprang the Carews and Careys, the FitzGeralds and Geraldines of all sorts and sizes. It is recorded that when Gerald de Windsor, the first Seneschal of Pembroke, married Nesta, the *chère amie* of King Henry I., the "Helen of Wales" and daughter of Rhys ap Tudor, Prince of South Wales, she had a building which stood on this site as her dower. From her marriage sprang the great clan mentioned above. In Edwardian times a castle was built here on the four-tower four-curtain plan so common at that period. The castle remained in the hands of the Carew family until the end of the fifteenth century, when Edward Carew disposed of the estate to Sir Rhys ap Thomas, who transformed the northern wing and lived here in almost regal state.

All the kingdom is the King's
Except where Rhys does spread his wings.

In this building he gave the banquet to over one thousand guests in April 1507, when he celebrated his Garter with a magnificent tournament lasting five days. His grandson Griffith was obnoxious to Henry VIII., and lost his head in consequence. Carew Castle became royal property. Queen Mary granted it to Sir John Perrot, an illegitimate son of Henry VIII. He commenced the eastern wing, but died in the Tower before its completion. There is a post-mortem inventory of his goods in which timber for the flooring and glass for the windows of this wing are mentioned. As the employer was away a prisoner the jerry-builder worked his wicked will, with the result that the beautiful oriel windows in the Perrot wing have fallen out, or, falling into decay, they were fixed in with wood. After Perrot's death the Crown resumed possession, and James I. re-granted it to the Carews, and in their hands it has remained. There was some unimportant fighting here in the Parliamentary wars.

Mr. St. John Hope, in describing the architecture of the castle, pointed out that it was not to be regarded as a fortress. It was on plan a square, with drum towers at each corner. One curious thing about it is the weakness of its entrance. The present little gatehouse is merely an addition to the curtain wall. The original entrance must have been an arch cut in the wall and presumably defended by gates. The main curtain wall had a very strong gatehouse which was apparently the oldest part. In the castle were two distinct sets of chambers, one dating from its first erection and the other belonging to different times. Amongst the apartments on the east side is a quite perfect chapel with a niche by the entrance door for the holy-water stoup. A fireplace was introduced after the chapel had ceased to be recognised as such. Leading off from it were a comfortable set of priest's rooms. Sir Rhys ap Thomas evidently attempted to make the building more comfortable, and struck out windows in all directions. The hall was built as usual on the first floor, over a great cellar, and was approached from the inner court by outside steps. It was more or less altered by Sir Rhys ap Thomas. The large porch gave access not into the hall itself but to the covered passage or screens. It was, said Mr. Hope, very instructive to see a big work like that in a partly unfinished condition, because it gave an insight into Elizabethan building methods.

Monkton Priory Church.

This church seems scarcely worth a journey for its own sake, though anyone visiting Pembroke ought to include it in their programme, as it is only a few minutes' walk from the great castle. As it stands it is a monument of what care and knowledge can do in a few years to atone for the neglect and misuse of centuries. According to the programme the church was that of an alien cell of Seez, in Normandy, founded in the twelfth century. When the alien houses were suppressed (*temp.* Henry V.), it was given by Humphrey, Duke of Gloucester, to John of Whethampsted, and by him to the Abbey of St. Albans. It has an aisleless presbytery and a nave with a central tower, and a detached chapel on the north. The north wall of the nave is double. In 1887 the church was in a deplorable condition, and the number of people attending was only six. But since that time many thousands of pounds must have been spent on judiciously restoring it. The presbytery is now the long choir of the church, and there is, of course, no dividing wall now between what used to be the monks' church and the public church.

Pembroke Castle.

This castle is, like that of Carew, built on a "pill" or creek of Milford Haven. There the resemblance may be said to cease. The general plan we give elsewhere shows the part Pembroke Castle played as to its position with Pembroke itself. The fortress was erected on a most strategic site at the spot where the river makes a great bend.

Mr. St. John Hope, in describing the building, said that from his point of view as guide it had been a most unfortunate thing that the castles hitherto visited by the Archæological Institute had all been founded by private individuals and not by the Crown. This fact meant that there were no references to them in the Pipe Rolls. But Pembroke was a royal fortress built for the defence of this part of the country, and to effectively control the passage of the river. The present structure contains nothing earlier than the thirteenth century, though it is said to have been established by Gerald of Windsor in 1105. The so-called Norman hall has nothing Norman about it. Entrance to the outer ward is gained first through an archway and barbican which stand at right angles to the great gatehouse. This is a very strong affair, and was equipped with several means of preventing people forcing an entry. Mr. Hope, however, emphasised the fact that amongst these would not be included either molten lead or boiling oil. The area of the castle enclosure amounted to four acres and was divided into a large outer ward and a much smaller inner ward by a deep ditch (now filled up) with its gate. One of the facts usually mentioned is that the Welsh king, Henry VII., was born in the outer courtyard of the castle. The present idea is that he was born somewhere in the great gatehouse. But with this theory Mr. Hope differed. One reason for doing so was the fact that it had not been so recorded by Leyland. Moreover Leyland states that the event was marked by placing the royal arms over a fireplace. And in the gatehouse no such fireplace is to be seen. It seemed more probable the birth occurred in one of the smaller towers. The principal buildings were in the inner ward. Near the inner gate was a chapel and a comfortable apartment which may have served for the soldiers on guard. What is marked on the plan and generally known as the "Keep" Mr. Hope said ought to be called "the great tower," the word "keep" not being found in use much before the reign of Elizabeth. This great tower, standing by itself upon a rock, was described by him as almost without parallel. It used to be divided into five storeys. Leyland says that there was a millstone on the top as a finish to the capping. The tower stands 75 feet high and is 60 feet in diameter at the base, where the walls are nearly twenty feet thick. The arrangement of the other buildings must be somewhat uncertain. The so-called Norman hall may or may not have been a hall of the thirteenth century. Towards the end of the thirteenth century they erected alongside of it a much finer hall with beautiful two-light windows of delicate tracery. One of the curiosities of Pembroke Castle is the Wogan Cavern underneath the north hall just mentioned. It measures 76 feet long by 59 feet broad, and is approached by a flight of stone steps. It is, no doubt, a natural cave enlarged by the early builders and incorporated into their buildings. The outer face to the river was covered by a wall, in which an opening was left protected by an iron gate. It would seem admirably fitted for storage purposes.

The successive castles on this site have played no inconsiderable part in English history from the days of Arnulph de Montgomery to 1648, when Cromwell dismantled the fortifications. It is now a noble and well-looked-after ruin.

(*To be concluded.*)

ILLUSTRATIONS.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

OUR plates this week are in illustration of buildings visited during this year's annual excursion of the Architectural Association to Touraine. The sketches and measured drawings were made by Mr. Banister F. Fletcher, F.R.I.B.A., who also lent us the photographs that we reproduce.

NATIONAL SANATORIA.*

UNDER the National Insurance Bill of this session it is proposed to be enacted by Clause 47 that:

"1. If under any other Act of the present session any sum is made available for the purposes of the provision of sanatoria and other institutions for the treatment of tuberculosis or other such diseases as the Local Government Board with the approval of the Treasury may appoint, such sum shall be distributed by the Local Government Board with the consent of the Treasury in making grants for those purposes;

"2. If any such grant is made to a county council the Local Government Board may authorise the county council to provide any such institution, and where so authorised the county council shall have power to erect such buildings and to do all such things as may be necessary for the purpose, and any expenses of the county council, so far as not defrayed out of the grant, shall be defrayed out of the county fund:

"3. Provides for the co-operation among county councils and other smaller bodies by the creation of joint boards or otherwise, and for the partition among the various bodies of the cost of such sanatoria."

With the necessary local variations the Bill applies to England, Scotland, and Ireland.

For the first time in the United Kingdom the provision of Sanatoria, as one of the means of dealing with tuberculosis, is proposed to be recognised as a national obligation, where hitherto it has been left to private charity.

As has always happened in our kingdom, and practically in most civilised kingdoms, it has been owing to the pioneer work of individuals, the strenuous action of men of foresight, intelligence and imagination, who, by their success in that to which they have put their hands and brains, have demonstrated the soundness of their judgment, that all great advances have been made; whether in founding colonies, in developing great industries, in the domain of science and art, or in attacking the insidious enemies at our door, such as disease, squalor, and insanitation. "By their faith ye may know them," their purposeful belief in the means to a great end, based on the observation of causation and effect, on reasoned analogies, on logical deductions, backed by an energy which has cried out for new or wider fields for their talents, time and opportunity. In the domain of sanitation, prejudice, apathy, the deadly conservatism of habit, and the fear of innovation, have had to be overcome.

The sanatorium, in a nutshell, is the embodiment of the root idea of open-air treatment under medical supervision. It is strange nowadays to find that although the necessity for this open-air treatment has been insisted on by apostles of health at intervals over centuries, and more persistently in the eighteenth and nineteenth centuries, their gospel was for a long time unheeded or ridiculed, they were as "voices crying in the wilderness." But such voices are not lost. They create wave sounds which, however attenuated they may appear to become, fall here and there on ears that are attuned to receive them, and new centres of dissemination take up the cry and carry on the message.

When at last the new doctrine came to be tentatively accepted, it was held that to make it efficacious patients should be located on mountain tops at altitudes where it was said no tuberculosis existed, and the first sanatorium was erected at Görbersdorf, in Silesia, in 1854. This presumption, however, was found to be inaccurate, and it was shown that altitude had nothing to do with the disease. Happily so for all of us in the United Kingdom.

It is now demonstrated that any site on a suitable soil that is sufficiently elevated for good drainage, for prospect and for openness is suitable for a sanatorium, provided it is not too exposed.

What is a sanatorium? It is a residential school of hygiene, where patients in the early stages of tubercular infection are taught primarily to take the fullest advantage of open-air and sunlight, and to regulate their lives in certain ways—as to hours of rising, eating, resting, working, and sleeping, that disease may be arrested and eradicated, that vitality may be stimulated, that energy may be renewed, that the subject may come out a healthier, stronger, and better citizen, and when he comes out that he may exercise the influence of his first-hand knowledge and disseminate the lessons he has learned.

There is much to be considered in the selection of a site for a sanatorium. First of all, in considering competing sites, ascertain the average number of hours of sunlight to which they are subject and give preference to those with the best record; next learn the relative humidity of the air from local causes, and note that site which has least. I have already shown that a great altitude is of no importance. What is important is that the site shall be open to the winds of heaven, that is to say, that there shall be free currents of air all round and through the buildings, that there shall be abundant access for sunlight, and that it shall be cheerful.

To attain these ends the site should be elevated above the land to the south, and on the colder sides it should be protected. But here a note of warning is necessary. By many a dense belt of woodland quite close up to the building on the northern and eastern sides has been encouraged. That is a mistake. Trees should be cut back to a considerable distance, and avenues should be made through them to allow great rivers of air to sweep through and around the buildings.

Incidentally, I have referred to prospect. This is of great importance. Shut in by woods or other limitation of panorama, a feeling of depression is engendered which is greatly to the detriment of patients. Extensive views, on the other hand, broaden the outlook not only of the physical eye, but of the mental vision. The play of light and shade, the kaleidoscopic changes of the clouds, affecting the colours in trees and herbage; the movements of man and beast and bird, of distant ship and of storm—all are helpful, interesting and stimulating to the sick and weary.

Subsoil is of importance. Clay as a subsoil is liable to get waterlogged with resultant mists from evaporation. Gravel pockets in a general clay formation are not good because the subsoil water becomes stagnant and gives off noxious gases.

Loose sand on the surface is worst of all, the gritty brittle particles blown by the winds are great irritants to the respiratory organs. A rocky soil is best so long as it has a verdant supersoil. The green-sand formations are good, and pine trees flourish on it with their resinous perfume.

The buildings should be set well away from all dusty roads.

I do not propose to deal at any length with the important matter of sewage disposal. That is now so well recognised that it is unnecessary to dwell on it.

Walking exercise is essential to the treatment of patients, and a considerable area of site is required for exercise where there is no open country with public commons or uplands. In any case, however, there should be an ample area for agricultural and other manual work.

This treatment is superseding the older treatment where patients were allowed to idle the whole day and to be fattened up. The sanatoria which pursue the other course, of providing and initiating the desire to work, not only produce the best cures, but are doing a great economic service to the patient and to the community. I would commend to your notice the results at Frimley under the able and untiring direction of Dr. Paterson.

The recently published report of the Royal Commission has settled, in the affirmative, the question so long in dispute, as to whether tuberculosis could be communicated from cattle, and it would appear to be advisable that every large sanatorium should have its own cows, whose milk should be under constant analysis by the medical staff.

Coming now to the type of the building itself. Much has been said and written as to the relative advantages of single and multi bed wards, of isolated huts and congregated rooms.

Single huts are reasonable where few patients have to be treated. The one room habitation is primitive, whether it be of wattle, of canvas, or of boards, but if a large number of people are to be housed, fed and supervised, and are to have the amenities of prospect and open surroundings, their huts would cumber the ground, and their abodes must be brought together so to leave the necessary open spaces. This eventuates in a large building, or may be series of buildings where apartments for patients are convenient of access from the administration, where baths for washing and for hydrotherapeutic treatment, and sanitary accessories may be disposed for general convenience, and where drainage may be concentrated and minimised.

If this be admitted as the necessarily practical development of the aggregation of sick persons, as in its essence it accounts for the formation of towns, then I think it will be fair to say that public sanatoria which have to deal with the masses should be started on the lines in which, as they become larger, they must develop.

*** Abstract of a paper read before the Congress of the Royal Sanitary Institute at Belfast by Mr. Edwin T. Hall, F.R.I.B.A. (Fellow).**

Practically all the sanatoria dealing with any considerable number of patients abroad or at home are on the concentrated principle. Nordrach is an exception, but that was a pioneer institution, is for paying patients, and is a colony of several houses which have been absorbed or built as the number of patients increased.

There are other artificial villages deliberately designed for paying patients where the house is large enough for a family or two. Of such is Montigny in the north of France.

These, however, are not the normal sanatoria.

It would now appear to be desirable to consider some details of the planning. Should each patient have a separate room, or should 2, 3, 4, 8, 10, or 20 be put together?

Dr. Bulstrode, in his encyclopædic report, says:—

"It may, perhaps, be accepted that a separate bedroom is desirable where economy is a minor object, and that in any case there should be a certain amount of separate accommodation available for cases obviously requiring it."

In the various institutions which I have described the sizes of wards varies considerably.

At Falkenstein	there are	1 and 2 bed wards.
,, Reppertshain	,,	1 and 4 bed wards.
,, Stockholm	,,	8 bed wards.
,, Osterasens	,,	1, 2, 4, and 6 bed wards.
,, Kronopark	,,	1, 2, and 4 bed wards.
,, d'Angicourt	,,	2, 3, 5, 8, and 12 bed wards.
,, Hauteville	,,	1, 2, and 3 bed wards.
,, Frimley	,,	1, 2, 3, and 4 bed wards.
,, Northwood	,,	1 and 10 bed wards.
,, The King's	,,	1 bed ward.
,, Crossley	,,	1, 2, 4, and 6 bed wards.

The objections to multi bed wards are that one patient coughing disturbs all the others, and those who are bad depress those who are recovering. On the other hand, two or three patients together are company for one another, and among the poor used to such companionship, this comforts them. I feel sure, from my own investigation and from conversations with medical superintendents, that the large majority of rooms should be single bed, but that a few of 2, 3, and 4, perhaps 5, may be of advantage; large wards are to be deprecated.

As to cubic space per bed, when it is borne in mind that in a well-designed sanatorium the rooms are practically in the open air by means of through currents, I believe that the cube need only be such as to ensure ample space on the floor for the necessary furniture, and for patient, doctor, and nurses, with a reasonable height for comfort. The large cubes are wasteful. In single bedrooms 1,300 cubic feet is ample, while in rooms with two or more beds a much lower cube may be safely adopted.

Rooms should be flooded with light, and the windows, all made to open, should be of large area and carried up to the ceiling. On the inner wall there should be large openings, and on the opposite side of the back corridor there should be corresponding openings, so that the air may be constantly changed in every part of the wards.

With rare exceptions there should only be one row of bedrooms on one side of a corridor.

Having endeavoured to lay before you general principles of design and arrangement, I will conclude by asking your consideration of the lines on which sanatoria for the multitude should be designed.

It is manifest that cost is an element of great importance when large numbers have to be dealt with; that the prevention of fire is another. The cost per bed varies naturally in relation to accessibility of building material and cost of labour. Sanatoria in England, built of brick and stone as distinct from temporary wooden structures, range from £350 to £1,000, and it is said in one case to be nearer £2,000 per bed.

In cases where local material is not available, when the distance from a railway is considerable, and where the institution is a large centre, self-contained, perfectly equipped and built on up-to-date hospital lines, providing its own water, electricity for power and lighting, its heating and hot-water installations, its laundry full of machinery, engine and boiler-house, kitchen, &c., fitted with labour-saving plant, ovens, &c., stores, recreation-room, workshops, research laboratories, mortuary and post-mortem rooms, an elaborate system of drainage, residences for medical and nursing staff, servants, gardeners, &c., I do not think £500 per bed is excessive. These central institutions are necessary, and fill a definite place. But the sanatoria under the Insurance Bill cannot be of the same elaboration. They ought not to be of boards (that material is far too dangerous in a wooded district), but may be, *pace* all by-laws, of a permanent character, one storey in height, with walls and roof three or four inches in thickness, without elaborate foundations and all the cost these entail.

CALCULATIONS FOR RETAINING WALLS.

(Continued from last week.)

16.—*Failure by Sliding.*

IN paragraph 12 we found that the wall was required to resist failure by crushing and failure by sliding. We have investigated the former; the latter is more easily understood. Fig. 9 represents a box on wheels. A tall man P_1 pushes it at A, a short man P_2 applies his strength to B, and they each separately find the same difficulty in moving the box. It is no easier for P_1 than for P_2 and *vice versa*. If the wheels were taken off this box the same argument would hold. No matter where it is applied it requires the same force to make the box slide over the ground. When we had wheels on it the box was easily moved the friction being small, but when the box lies on the ground there is considerable friction to be overcome.

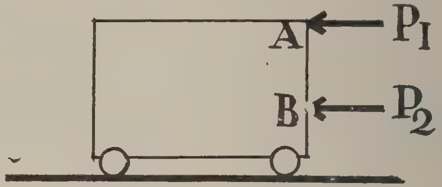


FIG.9

This at a joint in the wall will depend upon the weight of the wall, the area of the joint, and the material of the surfaces in contact, and is to be overcome by the outside force P. This might be written:—

$$W \times F = P$$

$$\text{therefore } F = \frac{P}{W}$$

F is a factor representing the friction of the surfaces in contact, and is called the coefficient of friction.

Its values are given in Table IV.

For common brickwork in mortar it is generally taken as 0.5. In the example worked in paragraph 15 for the joint AB:—

$$W = 1{,}680 \text{ lbs.}$$

$$P = (19.5 \times 5) + (15.6 \times 5.) = 17.55 \text{ lbs.}$$

$$\text{and } \frac{P}{W} = \frac{175.5}{1{,}680}$$

$= 0.0105$ which is lower than 0.5, so that the wall is quite safe against sliding. In practice this figure is not allowed to exceed 4-5ths of the co-efficient of friction. This value is not approached until the angle which R makes with the horizon is less than 30°, and it is only necessary to make calculations for sliding when the inclination of R is less than 30° degrees.

Note, however, that this does not hold good at the point where the foundation rests upon the earth, as the coefficient is much smaller.

TABLE IV.

Co-efficients of Friction (Morin).

		F
Masonry and brickwork (dry)		0.6 to 0.7
Ditto	with wet mortar	0.47
Ditto	with slightly damp mortar	0.74
Ditto	on dry clay	0.51
Ditto	on moist clay	0.33

17.—*Failure by Shearing.*

When the wall is homogeneous or without joints the sliding will occur by one minute particle sliding upon the next, the material being said to shear.

If the wall taken in paragraph 15 had been built in Portland cement concrete the resistance to shearing at AB would be

$1\frac{1}{2} \times 1 \times 2.5$ tons $= 3.75$ tons. (*See* Table IV.)

which is greatly in excess of P, the force tending to shear the wall ($= P_1 + P_2$). It is sometimes convenient, when a retaining wall would fail by sliding, to build it in cement mortar.

The joint is then required to shear instead of to slide.

TABLE V.

Safe Strength of Cement Concrete in Tension and Shear.

Mixture	Tensile Strength at Three Months.		Shear in Tons per Sq. Ft.
	Lbs. per Sq. In.	Tons per Sq. Ft.	
1 to 4	60	3.8	3.5
1 to 6			2.5
1 to 8			1.75

18.—*Retaining Walls for Water.*

As the walls themselves are similar in construction whether they retain water or earth or resist wind-pressure it will only be now necessary to investigate the outside force P.

19.—*The Pressure of Water.*

One of the first laws of hydrostatics is that the pressure of water is directly proportional to the depth below the surface. A cube of some easily crushable material is placed below the surface of the water. The pressure on the sides of the cube can be measured. The pressure is the same on all the six faces of the cube, and is equal to the weight of the column of water immediately above the cube. If a sphere is used the pressure on all the surface of the sphere is the same, and therefore the pressure in all directions is the same, and is equal to the weight of the water vertically above the sphere.

20.—*The Thrust on the Wall.*

Fig. 10 represents the section of a rectangular wall retaining water. It follows from the paragraph 19 that the pressure at any point is equal to the weight of the water vertically above it and is normal to the wall surface. Then if p be made equal to h it will represent the pressure affecting the wall at this point. The ordinates (p is called an ordinate) of the triangle ABC will, therefore, represent the pressure at any point, BC being made equal to AB, and the triangle ABC will represent the sum of all these pressures, which sum is the total outside thrust on the wall.

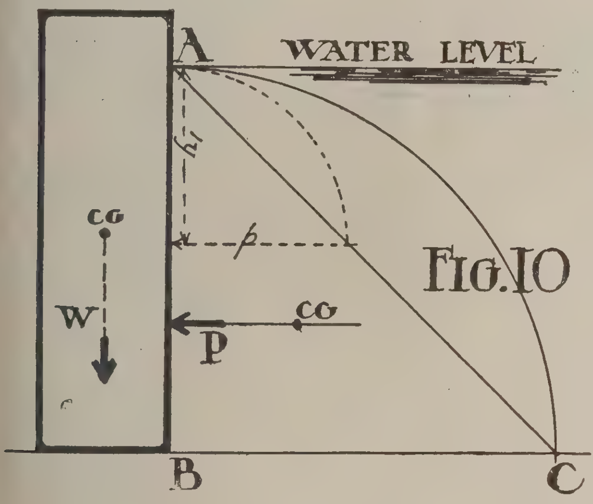

FIG. 10

This may be taken as one force P acting through the centre of gravity of the triangle ABC.

The magnitude of P = area of triangle in square feet × 1 foot length of the wall × weight of water per cubic foot (62.3 lbs.).

P being known, the stress on any joint may be calculated as shown for fence walls.

21.—*Walls with Sloping Back.*

The case of a wall with its inside face not vertical (as fig. 11) requires a little care.

The pressure at B or any other point is equal to the weight of water vertically above it, and being normal to (that is at right-angles to) the surface of the wall, will be represented by BC, where BC = AB. The triangle ABC will represent the sum of the pressures on the wall, and P acts through its centre of gravity as before, but normal to the face of the wall.

The overturning tendency, or moment of P, must be measured about O, the intersection of a vertical line through the centre of gravity of the wall, with the base of the wall.

To obtain the centre of gravity of a wall of this section set off on each side of the top a horizontal distance equal to the width of the base, and on each side of the base a horizontal distance equal to the width of the top.

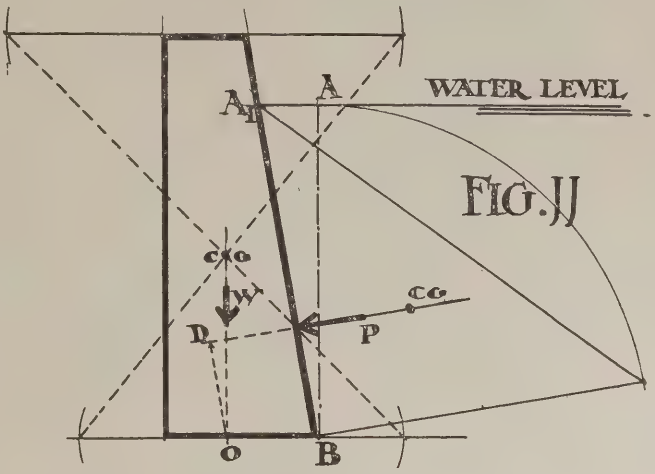

FIG. 11

The intersection of the lines joining the extreme points thus obtained is the centre of gravity of the wall.

22.—*Retaining Walls for Earth.*

The method of finding P, the outside thrust due to the pressure of the retained earth on a wall, is very similar to that explained in paragraphs 20 and 21.

We must first try and find out in what manner the retained earth will set up a thrust on the wall.

(*To be concluded.*)

ART SCHOOLS AND INDUSTRY.

THE report of the Departmental Committee upon the functions and constitution of the Royal College of Art and its relation to the Schools of Art in London and throughout the country was issued last week as a Blue-book.

The recommendations of the committee are as follows:—

(1) That the training of designers for the manufacturing industries should be specialised, and should be undertaken by provincial Colleges of Art, each of which, while continuing to provide a general education in art, should devote special attention to the needs of the dominant industry in its locality, and to this end should take steps to associate with its work representative manufacturers and artisans belonging to the industry;

(2) That these provincial colleges should be conducted as departments of colleges which deal with the practical and the scientific as well as the artistic sides of the dominant industries in their localities;

(3) That the provincial colleges should also be encouraged to undertake the training of teachers of art;

(4) That the training of teachers of art, wherever undertaken, should be conducted under conditions which will entail a higher standard of general or technical as distinct from artistic attainments, and should include an adequate pedagogic preparation;

(5) That universities should be encouraged to provide suitable degree courses for intending artists, architects, and teachers of art;

(6) That there should be a liberal provision of scholarships for industrial and other students of art, including part-time and full-time scholarships tenable at provincial colleges, which should lead up to further scholarships for advanced students tenable at approved places of study both at home and abroad;

(7) That scholarships for industrial students should be awarded upon conditions suitable to candidates actually employed in specific industries, and tenable for courses of study strictly related to those industries;

(8) That when a system of provincial colleges is established, the relation of the Royal College of Art to such colleges should be that of a school of advanced studies only, providing courses of one or two years' duration, adapted to the individual needs of its scholars and in close relations to the Victoria and Albert Museum;

(9) That, pending such a complete reorganisation of the college, the following improvements of detail should be effected in its existing organisation:—

(i) Steps should be taken to keep the college in closer touch with the general system of Schools of Art by the formation of an advisory council for education in art, which should include the visitors, together with representatives of industries dependent upon art;

(ii) The free studentships should be replaced by an increased number of national scholarships;

(iii) Students intending to become teachers should not be admitted after the age of 20, and should be required to show evidence on admission of a reasonable measure of general attainments;

(iv.) Students intending to become teachers should receive a proper course of professional training, including actual practice in teaching both children and adults by individual and class methods under expert direction;

(v) The professors should be associated with the examinations on which scholarships and exhibitions are awarded;

(vi) The outside professional work permitted to the whole-time professors should not, without special sanction, include teaching or educational organisation;

(vii) A month should be added to the length of the college term;

(viii) Opportunities should be afforded for combined work by all the four schools, and, if possible, for participation by the students in real work on public buildings or elsewhere;

(ix) Discretion should be taken to exempt students pursuing special branches of industrial design from the preliminary architectural course;

(x) The advanced architectural course should be widened by the inclusion of building construction, sanitation, and engineering;

(xi) More use should be made of the model in the school of painting;

(xii) Experts from outside the college should from time to time be invited to give lectures to the students;

(xiii) The system of rewarding students should be reconsidered, with a special attention to the value of foreign travel;

(xiv) A competent woman superintendent should be appointed for the women students;

(xv) A medical officer and dentist should be appointed;

(xvi) Careful supervision should be exercised over the lodgings of students;

(xvii) The arrangements for assisting students in finding employment after completing their courses should be systematised.

The committee in their conclusion say:—"The realisation of the developments foreshadowed above will, in our opinion, involve the provision of a new building. In view, however, of the transition period which we contemplate in the history of the college, we have made no definite recommendation as to the buildings; but we think it right to put upon record our opinion that the existing buildings are neither in dignity nor in convenience worthy of a national establishment, and that they call for some immediate expenditure to cure the more prominent defects referred to in the report.

"The Royal College of Art has done and is doing useful and important work, and although the development of the greater provincial art schools now makes it possible to relieve the college of some portion of its present duties, we anticipate that the changes we recommend will rather add to, than detract from, its importance. As a post graduate college in close touch with art schools throughout the country, it will have for the first time a well-defined position as the culminating point of the whole system of industrial art training in England."

ROYAL COMMISSION ON ANCIENT MONUMENTS IN WALES AND MONMOUTHSHIRE.

In May 1908 a Royal Commission was appointed "to make an inventory of the ancient and historical monuments and constructions connected with, or illustrative of, the contemporary culture, civilization, and conditions of life of the people in Wales and Monmouthshire from the earliest times, and to specify those which seem most worthy of preservation."

The Commission consisted of Sir John Rhys, D.Litt., F.S.A., F.B.A., Principal of Jesus College, Oxford, and Professor of Celtic in Oxford University; Professor Edward Anwyl, M.A., Professor of Celtic in the University College of Wales, Aberystwyth; Professor R. C. Bosanquet, M.A., Professor of Classical Archæology, Liverpool University; Mr. Robert Hughes, ex-Lord Mayor of Cardiff, President of the Cardiff Cymmrodorion Society; Rev. G. Hartwell Jones, D.D.; Lieut.-Col. W. E. Llewellyn Morgan, R.E.; Sir E. Vincent-Evans, Secretary of the Honourable Society of Cymmrodorion; and Mr. Edward Owen, F.S.A., Secretary.

The course of procedure which had commended itself to the Commissioners as likely to afford the best results in (*a*) the compilation of the inventory of the monuments, and (*b*) the preservation of the monuments, and which was outlined in their first report issued last year, has been found to achieve both ends more effectively than could probably have been attained by any other method.

The actual work was commenced in the county of Montgomery. The Secretary of the Commission was appointed to visit each monument, and in the period covered by the first report he had completed the inspection of about one-half of the monuments of the county.

The number of monuments to be inspected and included in the inventory proved so great, and the physical difficulty of reaching many of them so considerable, that it soon became clear that, if the work was to be continued on the scale and carried on with the thoroughness with which it had been begun, further assistance would have to be obtained. The authority of the Treasury was given for the employment of two assistant inspecting officers during the season within which outdoor visits are possible; and Mr. Alfred Neobard Palmer, of Wrexham, and Mr. George Eyre Evans, of Aberystwyth, two competent Welsh antiquaries, were accordingly appointed assistant inspecting officers, to work under the general direction of the Secretary.

The report of the Commission for the year 1910 states that these gentlemen were engaged throughout the late spring, summer, and early autumn of the year 1910 in the inspection of the monuments of the districts with which each is best acquainted. Mr. Eyre Evans assisted the Secretary of the Commission in completing the examination of the monuments of Montgomeryshire. This work has been accomplished, all the inventories have been printed, and the volume upon the monuments and constructions of Montgomeryshire is practically ready for issue. It is only delayed by certain difficulties in connection with the illustrations to accompany the letterpress. Mr. Palmer visited and described the whole of the monuments and constructions of Flintshire, and the work of preparing the inventories dealing with that county for the press will be undertaken as soon as the volume for Montgomeryshire has been issued.

Simultaneously, the monuments of Radnorshire were taken in hand by the Secretary, and satisfactory progress was made with the inspection of the antiquities of this difficult county before the work ceased for the winter.

It is hoped that the season of 1911 will see the inspection in Radnorshire, as well as that in the eastern half of Denbighshire, completed. Thus, at the end of the present year the Commissioners expect to have finished one-fourth of the most difficult portion of their great and interesting task.

The Commissioners continued their visits to the counties where the inspecting officers were at work, though their visit to Flintshire, coinciding as it did with the lamented death of His Majesty King Edward, was interrupted. In the month of September they visited Radnorshire, and had the advantage of seeing many of the characteristic monuments of antiquity in that county. They desire to express their thanks to everyone with whom they came into contact, whether gentlemen of private station, or those officially engaged in public administration. The study of the important monuments of those particular counties has, they say, prepared them the better to "specify those which seem most worthy of preservation." The Commissioners have endeavoured upon every favourable occasion to stimulate the interest of all classes in the monuments as the best means of preserving them.

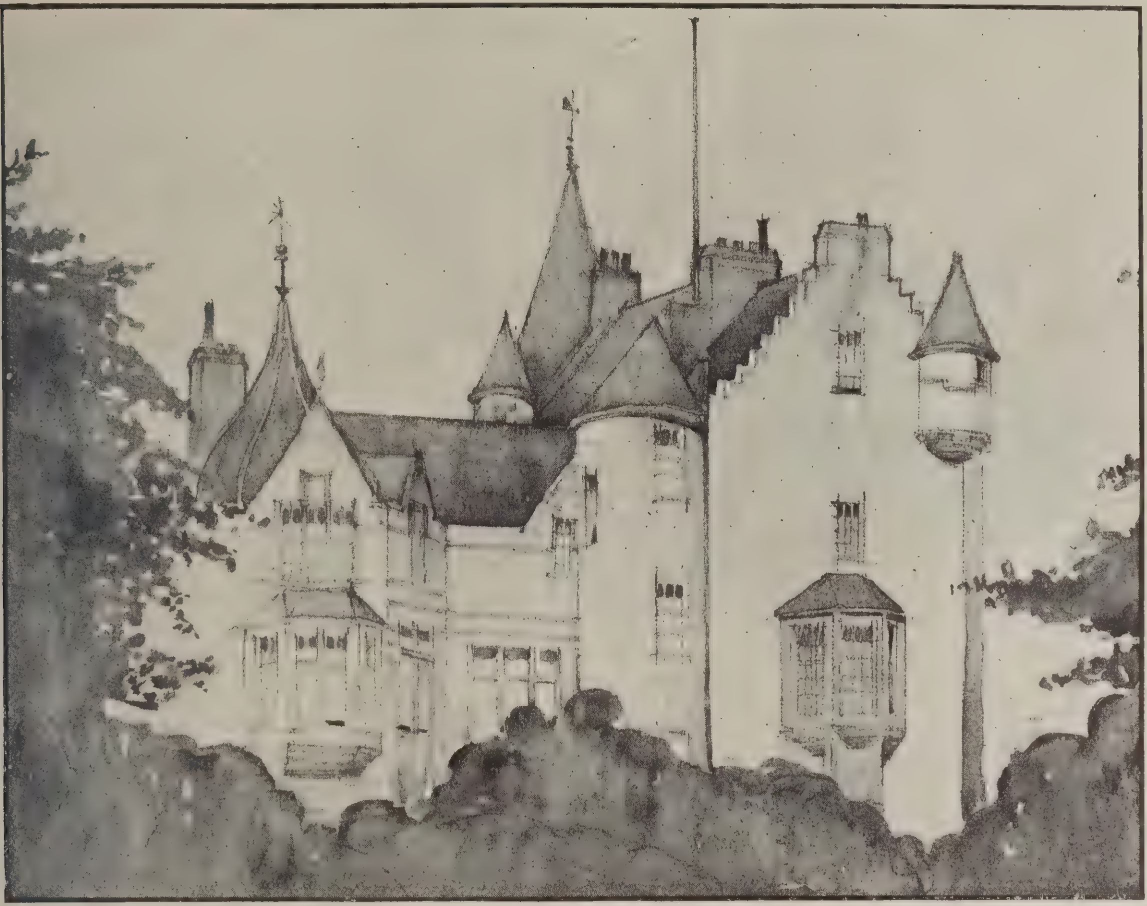
The Commission meets at regular intervals to consider the inventories prepared by its inspecting officers, and, owing to their zeal and activity, this is becoming a work of ever increasing extent and interest.

Only one sitting was held during 1910 for the purpose of receiving evidence upon the subject-matter of the enquiry. This was held in June, when Dr. Robert Cochrane, I.S.O., F.S.A., Inspector of Ancient Monuments in Ireland, gave the benefit of his experience in that capacity. The Commissioners repeat the invitation given in their first report, and again express the pleasure with which they will receive the testimony of anyone possessing first-hand knowledge of the monuments of his district, and desirous of making carefully considered suggestions as to their preservation.

As in the preceding year, the attention of the Commissioners was directed to several cases of actual or impending destruction of ancient monuments, to two examples of which they draw special attention.

Late in the year 1909 they were informed that certain

“THE ARCHITECT” STUDENTS' SKETCHING AND MEASURING CLUB.



CULLEN HOUSE, BANFFSHIRE. VIEW FROM SOUTH.—From a drawing by Mr. W. A. Robb.

In the beautiful seaport town of Cullen in Banffshire, near the parish church and crowning a steep rock, stands this magnificent baronial Manoir of Cullen. It is a striking example of a Scottish mansion house on the hollow square plan.

The approach and main avenue to the principal entrance leads over a bridge which spans the Deskford burn. The span of the bridge is in one great archway eighty-two feet wide. The entrance itself is dignified in the extreme, flanked at each side by two standing lions which bid defiance to the intruder. The doorway is richly moulded, having carved panels in low relief, the whole forming a striking contrast with the plainness and solidity of the surrounding masonry.

The house dates from the fourteenth century, but it has been altered and added to at various periods since then. In the old town records it stands entered that “Upon ye XX. day of Mrche 1600 yeiris the lairdis hous in Culane was begun and the grund cassin.” This laird was Walter Ogilvy, who married as his second wife Mary Douglas, and their arms and monogram appear several times on the walls of the house. The interior of the house has been almost entirely modernised, but is full of rich colouring in panels and tapestries, and contains elaborate carvings by Grinling Gibbons, also many fine portraits.

It is supposed that Charles II. visited Cullen on the occasion of his landing at Speymouth (about thirteen miles west of Cullen) on June 23, 1650, although his visit has not been recorded.

The park and grounds in which the house is situated are beautified with streams and lakelets, trim lawns and stately groves, and extend far into Rathven parish. A graceful temple, commanding a splendid view over the neighbouring sea, forms one of the architectural features of the grounds. Rising in the background there is the Bin hill, some 1,050 feet high.

This magnificent mansion house is the Banffshire seat of the Seafield family and is occupied at present by the Countess Dowager of Seafield.

---

ancient remains on the slope of the Llanelwedd Hills, in the County of Radnor, and overlooking the River Wye, were scheduled for compulsory acquisition by the Brecon County Council under the Small Holdings Act of 1908. The threatened monuments consisted of several long, low mounds, which, from the available evidence, it is difficult to pronounce to be anything but sepulchral. Undoubted remains of prehistoric times are found upon the higher slopes of these hills. A public enquiry was held by the Board of Agriculture and Fisheries, at which the Commission was represented. The site was visited by the Commissioner of the Board of Agriculture and the representatives of the Commission. It was agreed, with the cordial assent of the Breconshire county authorities, that the mounds in question should be placed outside the scope of any order that might be issued. The owner of the land has since leased the lower slopes of the hill for quarrying operations, with conditions safeguarding the mounds within the area covered by the lease, but it is to be feared that such work, proceeding as it does in close proximity to the monuments, may lead to their disturbance.

The other example to which they call attention is the serious damage that is being done to the remains of the castle of Dyserth, Flintshire, damage that must result in the complete destruction of the ruins. The structure, which is of the period of Henry III., is built upon a hill extending east and west, the castle being placed at its western extremity. The northern side of the hill slopes gradually, and towards the south it falls abruptly a distance of about 200 feet. It is this precipitous face of the hill that is being quarried. In the course of his inspection of the Flintshire monuments, Dyserth Castle was visited by one of the assistant inspecting officers, who duly represented the destruction that had been already effected. The Commissioners at a later period made a visit to the castle, and were witnesses of the demolition then in progress. The parts of the structure which occupied the southern side of the hill have been swept away, and the only remains at present existing are the double towers at the east and west ends, fragments of the north curtain wall, and a few vestiges of the exterior defences. The quarry line takes in much of the interior quadrangle of the castle, and at the date of their visit it was only 55 feet distant from the north wall. The face of the rock cleared for quarrying operations extends beyond the line of the ruins on either hand, and is being worked along its full extent. The number of men then at work was small, so that the progress was not rapid. Any increase in the output, however, will accelerate the disappearance of the ruins. In any case, the complete destruction of the castle would appear to be only a matter of time. The owner of the property is Mr. Leonard Hughes, an artist, who has leased the castle rock to the Castle Limestone Quarry Company, of Mostyn. The Company holds the property by virtue of a lease for thirty years, granted by Mr. Hughes on March 7, 1903. No allusion is made in the lease to the castle ruins, but a provision is inserted that no limestone is to be worked "under or within fifty yards of any buildings now built for agricultural purposes upon the demised premises."

The duties and responsibilities which fall upon the owners of ancient edifices or constructions are often found to be accompanied by certain inconveniences, though these causes of irritation are, it is said in the report, generally borne with much patience and good feeling, for the sake of the memorial of which the possessor is generally proud to regard himself as custodian for the nation. There appears to be an impression in certain minds that this Commission possesses the power to step in and avert the destruction of an ancient monument, though its owner may have no desire to preserve it, and on more than one occasion the Commission has been assailed in the public Press for not exercising an authority it does not possess. It should be borne in mind that the Commission was called into existence for a specific purpose, as stated in the first paragraph of this report, and that it has no power to go beyond the strict limits laid down in the terms of reference. Deeply as the Commissioners have been moved by the indifference and carelessness of a Government department which has doomed the great prehistoric camp on Penmaenmawr to eventual destruction, and profoundly as they deplore the more rapid destruction of the privately-owned castle of Dyserth, they are unable to do more than draw public attention to these and such other regrettable occurrences as may be brought to their notice.

The Commissioners urge the desirability of Parliament establishing some machinery with power to intervene in order to prohibit the destruction of the historic treasures of the nation, which at present, they say, are too often sacrificed to selfishness and greed, or allowed to suffer from the consequences of ignorance and neglect.

THE ITALIAN MARBLE AND ALABASTER INDUSTRY.

THE British Consul-General at Florence, in course of his annual report, says:—The marble and alabaster commercial statuary, which constituted until lately one of the most flourishing industries in Florence, is passing, owing to the competition of Germany and France, through a very serious crisis. It must be remarked that most of the statues which are seen in the Florence shops are not marble but alabaster, which, while very transparent in its natural state, turns into a compact and slightly granulous matter through the process of baking, becoming similar in appearance to the Carrara and Serravezza marble. Not being, however, so hard it has the advantage of being more easily worked, with an economy of 50 per cent. in labour. White alabaster is only to be found in the province of Pisa. Formerly alabaster statuary was exclusively a Tuscan industry, the Florence speciality being statuettes and that of Volterra small articles such as letter weights, curios, &c. Now, however, Germany and France have established large manufactories for the production of alabaster statues, statuettes, &c., worked by machinery, the raw material being obtained from Pisa at low prices, thereby injuring by their competition the Florentine industry, notwithstanding the superior artistic production of the latter. I am informed that to counteract this evil a trust of Tuscan financiers is negotiating with the quarry owners to secure the monopoly of the alabaster, which, I presume, is intended to be to the advantage of Tuscan sculpturing.

In the annual report of the British Vice-Consul on the trade and commerce of the Port of Spezia, it is stated that Carrara marble is the principal article of export in the Spezia Consular district, though little or none is shipped at Spezia proper. A new branch of railway is in course of construction from the station of Aulla on the Spezia-Parma line to the northern side of the Carrara range, where it is believed there exists a better quality of marble which, owing to the difficulties of transport, has not yet been quarried. When this branch is completed it will be a comparatively simple matter to convey the marble to Spezia, though it is more probable that the greater part of the product will be sent on by rail through Parma to Milan, and thence to Northern or Central Europe. As Massa-Carrara, the seat of the marble industry, is in this district, the following table showing the statistics of the marble export for the year 1910, as published by the Carrara Chamber of Commerce, is given:—

Marble Exported during the Years 1908-10 *from the District of Massa-Carrara.*

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

R.I.B.A. Committee on Reinforced Concrete.—Second Report.

SIR,—Page 16 of the above report contains the following paragraphs:—

"The most efficient disposition of the lateral reinforcement would appear to be in the form of a cylindrical helix, the pitch of distance between the coils being small enough to resist the lateral expansion of the concrete.

"Jointed circular hoops, as ordinarily made, are apparently not quite so efficient."

And methods by which the amount of reinforcement in columns of this type can be calculated are also given.

As both hooped and spiral concrete are covered by the well-known Considère patent we shall be glad if you will state this fact when making any reference to the new report in your paper. Thanking you in anticipation, we remain, yours faithfully,

CONSIDERE CONSTRUCTION Co., LTD.
Herbert E. Hemburg, Assistant Manager.

King Edward Memorial.

SIR,—It would be interesting to know which way it is proposed that the statue in Green Park should face. The site has the same obvious disadvantage in this respect as the one first proposed in St. James's Park. If it faced north the back would be turned to the Victoria Memorial and to the fine approach to it up the rising Broad Walk. If the statue were turned the other way the effect on the loyal lieges passing along Piccadilly would hardly be pleasing—to say the least of it.—Yours faithfully,

E. B.

IT is proposed to erect a town hall for the borough of Dukinfield, Lancashire, and thus complete the plan of the present municipal buildings, which were built eleven years ago at a cost of nearly £18,000, a sum largely in advance of the estimate. The proposed town hall is expected to cost between £6,000 and £7,000.

Thursday, August 31.

Guild of Architects' Assistants: Visit to Victoria Palace, Victoria, S.W. (Messrs. Frank Matcham & Co., architects).

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.—II.

MONDAY, August 14, might be considered as the opening day of the usual week over which the annual excursion of the Architectural Association officially extends, although, as we recorded last week, a fair amount of work had already been done in accordance with the programme. The heat experienced during Saturday and Sunday gave the official leaders of the excursion cause for fear that the arrangements in the programme would be too much for the capabilities of the horses of Blois, and hence an alteration—and a rather serious one—was determined. The visit to the Château de Chambord, the most magnificent of all those in the Loire district, was abandoned, and it was resolved to take the train to Romorantin and drive thence to the Château du Moulin, the second string on the day's programme.

Some of the more enterprising spirits of the party were not, however, satisfied with this curtailment and showed the official leaders a better solution by driving to Chambord and then joining the main body in the train at Mont, thus being enabled to see the Versailles of Touraine as well as to share in the regular proceedings. Romorantin, an important market town, has several interesting remains of old work and picturesque bits, but the time of the party was principally occupied by the customary French *dejeuner*, very good but very demoralising for the earnest student. Thus on this first official day the excursionists experienced some of the outstanding features of this year's outing, drastic alterations of programme and much time spent, we must not say wasted, on many coursed luncheons and on journeys, long in time if not in distance.

Thus the net result of Monday's programme was two and a half hours at the Château du Moulin, a comparatively small but charmingly picturesque example built of stone and brick in 1480 from the designs of Jacques de Persigny for Pierre du Moulin, who saved the life of Charles VIII. at the battle of Fornoue, and whose tomb in the church of Lassay is adorned with a fresco showing the château and St. Christopher.

The château has recently been restored under the direction of Mons. Génuys, and made habitable for the present owner, Mons. de Marcheville. The house and gatehouse are separate buildings on an island of considerable size surrounded by a deep moat and with circular towers and drawbridges have quite a military air. The detail, although showing some indications of Renaissance influence, is principally of late Flamboyant character. In the garden is a beautiful stone well-head of the fifteenth century.

Blois was left on Tuesday morning for a change to the second and chief headquarters at Tours, and on the way the train was left at Onzain station, whence the party walked across the somewhat decrepit old suspension bridge over the Loire to the village of Chaumont, and after the inevitable *dejeuner* they proceeded to the château. By an unfortunate contretemps it was overlooked in the preparation of the programme that Thursday is the only day on which the public are admitted when the family is in residence, so that it was only by a special act of grace that the party was admitted and shown over the château, and this favour did not extend to sketching and photographing or to a very lengthy stay in the park.

Chaumont was a feudal fortress in the tenth century, but the erection of the present château was commenced by Charles d'Amboise, who succeeded to the estate on the death of his father Pierre in 1473, and continued by Charles II. of Amboise on his accession to the title in 1481. Catherine de Médicis bought the château in 1560 but did not reside in it, preferring to force an exchange of it for Chenonceau on Diane de Poitiers, who herself abandoned it for Anet. The château passed through the hands of many owners and became more or less dilapidated, till about 1833 the Comte d'Aramon commenced a serious restoration and started the collection of furniture and artistic treasures which it now contains. Prince Amédée de Broglie bought the place in 1875, and has completed the restoration with the assistance of Mons. Sanson as architect and Mons. Margotin as sculptor. Built in the period of transition from Mediæval to Renaissance architecture the château now looks almost as new as when it was first erected, and thus gives us an opportunity of judging what the architecture of the end of the fifteenth century looked like without the adventitious effects of time. Those who do not admire it as its original builders saw it, raw and crude, can at least estimate to some extent how much of their admiration of old work is due to the original design and how much to the modifications of nature and time.

Chaumont consists of three irregular corps de logis flanked by machicolated circular towers, with steep conical roofs, and surrounding a courtyard opening on to a terrace on the side towards the Loire. Ornamenting the surfaces of the walls are the initials and symbols of Louis XII., Anne of Bretagne, the Cardinal Georges d'Amboise, Charles of Amboise and his wife Catherine de Chauvigny, and of Diane de Poitiers, as well as the volcanos, punningly alluding to the name Chaud-mont. It seems that the internal court was originally completely enclosed with a fourth side which was destroyed in the eighteenth century.

This château is one of premier rank in importance, both historically and artistically, and contains a fine collection of tapestry, furniture, carving, and other bric-à-brac, for the most part carefully chosen as illustrative of the art and life of France at the period of the best days of the château, and the time allowed to the excursionists was all too short. To add to the misfortunes of the day, the train by which it was intended to proceed to Tours did not call at Onzain that day, being the National Fête and Feast of the Assumption. The heat was terrific, and enforced idleness was not therefore altogether unwelcome; but one could not help feeling that a half-hour's sight-seeing was hardly a profitable record for a whole day in an A.A. excursion.

As usual, a railway journey and *dejeuner* filled up the first part of Wednesday, and then a visit to the château of Chenonceau was all too short for serious study after the formal inspection of the interior, with Philibert Delorme's bridge-gallery over the Cher. One wonders what would have been the effect of a great building on the opposite bank, with an intention of which Delorme is credited and without which the bridge and gallery is somewhat of an anomaly. Certainly he would not have felt fettered by any regard to the composition or detail of the château erected in the sixteenth century by Thomas Bohier and his wife Catherine Briçonnet. The gallery and stables which Delorme erected for Catherine de Médicis clearly show his independence of the earlier work. This, too, is free from any subservience to the still more ancient château of the Marques family, of which only the keep now remains, or to the thirteenth century substructure on which Bohier raised his house. Well grouped and picturesque as is this latter, it is in the character of its environment that lies the unique character of Chenonceau. The interior, well restored, has much interesting work in Bohier's construction. Delorme's gallery is internally no more than a fine corridor.

From Chenonceau the excursionists drove to Amboise, whose picturesque situation, towering above the town and the Loire, was discounted by the rigid prohibition of sketching and photographing within the precincts of the château.

Amboise is of very ancient history, dating back to the time of St. Martin in the fourth century, but it was not till 1434, when Charles VII. added it to the royal domain, that it began to play any important part in French history. In the struggles between the Guises and the Huguenots it became of premier importance.

The gem of the buildings now existing is the small chapel of St. Hubert, built by Charles VIII., and noteworthy besides as containing the tomb of Leonardo da Vinci, who was there buried in 1519. There is much to be seen of interest in the town of Amboise as well as in the château, but the time at the disposal of the excursionists was far too short for its full enjoyment even by the unfortunate members of the party who missed the train to Tours.

(To be continued.)

NOTES AND COMMENTS.

The Special Commission of the British Fire Prevention Committee, which has been spending a week in Paris studying the local fire protective arrangements under the guidance of the French Government, has been much impressed by the precautionary regulations and fire service organisation at Mons. Lepine's disposal. The latter—who in his capacity as Prefect of Police and head of the fire protective departments of the French capital accorded the Commission the closest personal attention, entertaining them on two occasions at luncheon and accompanying them to many of the institutions visited—is, however, anxious to adopt the methods of the British Committee on the fire preventive side and gave frequent public expression of his appreciation of the international utility of their work. The Commission, which comprised Mr. Edwin O. Sachs, F.R.S.Ed., chairman; the Earl of Londesborough, K.C.V.O., member of Council; Mr. Marsland, honorary secretary; Mr. Folker, honorary treasurer; Mr. J. Herbert Dyer, member of the Executive; with Lieut. Spencer, R.N., and Mr. E. Boyce-Podmore attached, visited all the principal fire stations, saw numerous drills, exhibitions, displays, &c., and inspected a very large number of public buildings and works, including the Opera House, several playhouses, cinematograph theatres, the great electric power houses, water reservoirs, gasometers, &c. They were also present at the parade of 15,000 members of the French provincial fire service which took place during their stay, and which was reviewed by the leading Government officials of the Republic concerned in matters of fire protection. Further, they attended the Congress of the French Fire Service Federation and visited the ambulance stations and flood stations of the Seine. A detailed illustrated report of the Commission's visit to Paris will be prepared for the use of the authorities at home, but a number of data on the work of the British Fire Protection Committee are also being prepared to supplement the particulars already presented for the use of the French authorities as a basis for the proposed organisation of a similar body for France. The Special Commission gave a formal luncheon to their hosts at the Hôtel de Crillon, and were entertained on various occasions to dinner by the local authorities and the fire service organisation.

At the Congress of the Royal Institute of Public Health held at Dublin the peculiar conditions of that city as presented in the opening address of Mr. P. C. Cowan, M.I.C.E., D.Sc., to the section over which he presided are of a heart-breaking character to the sanitarian. He stated that in Dublin more than one-third of the total number of families in the city live in single-roomed tenements, and the sanitary condition of many of these is deplorably bad. Dublin is much disfigured by the existence of many derelict building sites on which old houses have been allowed to fall into ruin. With respect to them Mr. Nicholas J. Synnott, whose writings on housing questions are of much interest and value, says: "An enormous number of condemned houses in Dublin have remained unrepaired and untenanted. Experience has shown that, even under the special compensation clauses of the Housing of the Working Classes Acts, the cost of acquiring these sites is prohibitive, and prevents rebuilding except at a loss. Where houses are condemned the sites are generally useless, or are not, in fact, used by the owner. I suggest that it is demanded by public policy, and would not be unjust to the owner of condemned property that if, after reasonable notice, he neither repairs nor rebuilds in accordance with municipal requirements, the law should allow the property to be sold by public auction, and the proceeds paid into Court or apportioned amongst the owners or persons interested. Private builders or artisans' dwellings companies would then probably acquire the sites at figures which would give a remunerative return, and the owner would have even less ground of complaint than the owner of condemned food, which is subject to the more rigorous method of confiscation."

Dr. Cowan referred to the suggestion of Professor Geddes that gardens might be formed on a number of derelict spaces in Dublin, and a movement is on foot to carry out this suggestion. It is quite likely that for some time the gardens might be badly treated, but ere long the people would take an interest and delight in them, and the street children would soon cease to damage what would, in effect, be their gardens. The experience of Belfast and Folkestone showed that open public gardens were quite safe from wilful damage.

Councillor James Vaughan, chairman of the Public Health Committee of Dublin Corporation, in a paper on "The Housing Problem in Dublin," dealt with the question of insanitary and slum property, and summarised his views by urging the following recommendations:—1. That fresh legislation is required in order to check decay in cities, and to impose on middlemen and ground landlords some of the expense of re-modelling slum property. 2. That all housing schemes should, as far as practicable, deal only with the housing of the very poor. 3. That local authorities of themselves cannot economically provide sufficient housing accommodation for the very poor. 4. That it is not only desirable but necessary that in all cities having slums, and where housing accommodation for the very poor is limited, that a Towns Improvement Trust should be formed by the wealthy and representative citizens. 5. That a Town Planning Act is required for Ireland.

The Pennsylvania Society has issued a small but interesting brochure on the church of Allhallows, Barking, in connection with the placing in that church recently of a memorial tablet to the memory of William Penn, whose baptism is recorded in the parish register as occurring on October 23, 1644. The brochure is illustrated with photographs of the interior of the church and of the bronze tablet designed by Messrs. McKim, Mead & White.

The Land Union has issued the following advice to property owners: Provisional valuations are now being served in considerable numbers throughout the country. The values shown are intended to be the basis for levying all the new duties on land and property introduced by the

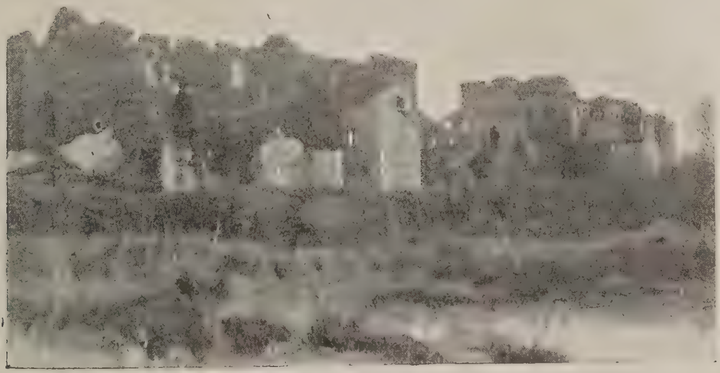
Budget of 1909, and the avowed object of the valuation is the future nationalisation of the land by means of the taxation of land values. Under these circumstances property owners are strongly advised to scrutinise carefully the valuations served upon them, as, after the expiration of sixty days, unless an objection is lodged, the values will be fixed against them for all time. Owners in doubt should communicate with their professional advisers, with the hon. secretary of any local branch of the Land Union, or with the secretary of that organisation in London at St. Stephen's House, Westminster, S.W.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

(Concluded from last week.)

THIS week we bring to an end our account of the Summer Meeting of the Royal Archæological Institute, which opened at Cardiff on Tuesday, July 25. For the second part of the programme Tenby was used as the headquarters. Monday, July 31, was devoted in the morning to Tenby and in the afternoon to Caldey Island. On the following day Carew Castle, Monkton Priory Church and Pembroke Castle were all visited, and of all these an account was given in our issue of last week. After lunching at Pembroke a drive in the motor-cars of half an hour brought the party to

LAMPHEY PALACE.



LAMPHEY PALACE.

There is not very much to be seen and not very much to be said about these ruins. Mr. E. Laws, F.S.A., who had come from Tenby to describe them, confessed that though he was particularly interested in the building, he was also particularly ignorant concerning it. Tradition divides the Palace into two periods, viz. the east block attributed to Bishop Gower (1328-1347) and the west block to Robert Devereux, Earl of Essex. There was, however, an earlier episcopal palace here or hereabouts, as also a later period of importance. When Gerald de Windsor in the twelfth century was besieged in Pembroke Castle by the Welsh he caused a letter to be dropped at the Bishop's house at Lamphey. Mr. Laws was of opinion that the earliest building stood behind the existing main blocks. It was one of the seven episcopal residences in the large diocese under the Bishop of St. Davids. Here the Earl of Richmond, later Henry VII., was entertained after his arrival at Milford to claim the throne and to take the field at Bosworth. Henry VIII. put pressure on the first Protestant Bishop to give up the palace, and on this being done he sold it to Lord Hereford, father of the first Lord Essex, Queen Elizabeth's favourite. It was the residence of the three Devereux, Earls of Essex. These noblemen were extremely popular, and it is probable that it was in consequence of the political views held by the last Earl that when the Civil War broke out Pembrokeshire was found to be the most seditious county in Wales, and more like English corporations.

Mr. W. H. St. John Hope, M.A., in discussing the building from a less historical and more architectural point of view, took occasion to repeat a protest which he had made on more than one previous occasion. He rightly said that it was impossible to describe the Palace without a liberal use of the knife and the axe, so cloaked was it in a green curtain. It was, he added, possible to have Virginia creeper anywhere; but there was only one Lamphey Palace. As to the buildings themselves, he remarked that their arrangement was a little obscure, because the curtain wall had been pulled down. There was no doubt that it was originally a very nice house, surrounded by a deep ditch. The small square gatehouse now standing isolated in the middle of a large garden is remarkable for a peculiar treatment of the parapet similar to that in another part of the buildings. The same treatment is to be seen at the episcopal palace at St. Davids and at Swansea Castle. It appears to have originated with Bishop Gower, who built the first about 1340, and rebuilt the second about 1330. The great hall could be accepted as unquestionably mediæval, though it is impossible to see the detailed features owing to the ivy and other creeper. It seems to have had a peculiar apartment on its upper floor. On the outside the windows inserted by the Tudor owners may be seen. On the ground level of another building is a very fine cellar-like apartment, with a roof having cross ribs. It is now the preserve of a bull of awe-inspiring aspect. Above it was a series of rooms, as is indicated by the presence of three fireplaces. The chapel (1509 to 1523) is another detached building of two storeys, and is noteworthy for the charming tracery in the six-light east window. This is the most prominent architectural feature visible. Those who go to Lamphey Palace with an enthusiasm for creeper will be amply gratified; the architect and archæologist must seek as best he can for the constructional features underneath. The owners, it must be explained, are careful to keep everything tidy, and are, no doubt, acting according to their lights in leaving the creeper in position. Its removal would undoubtedly have to be done with the greatest caution.

MANORBIER CHURCH.

If Lamphey Palace is overcovered with ivy and creeper, the reverse seems to apply to Manorbier Church, which was next visited. This building stands on an exposed valley side in a most uncompromising fashion, which is emphasised by the presence on the north side of the chancel of a tall square tower without a single buttress or other projection.

John Carter, writing in the *Gentleman's Magazine* in 1804, described it thus:—" The church in its exterior is rather singular, from a tower which rises between the body of the building and the chancel. In the interior the architecture is after the pointed manner, and is simple in the extreme, giving, in most respects, piers and arches without plinths, capitals, mouldings, or ornaments of any kind. The vault of the roof is one-pointed headway without rib or other decoration. Notwithstanding all this simplicity in masonry, yet it was not without charms, at least to me, who can receive as much gratification from an humble performance in this way as in a more elaborate work not presenting so much of the artless as the endeavour just spoken of. On the north side of the chancel, under a plain arch in the wall, is a plain tomb, also bearing the statue of one of the family (as it is generally understood) of Geraldus."

The skeleton architectural history of the church is as follows:—It originally had a twelfth century aisleless nave, the walls of which were pierced in the thirteenth century and aisles added. Considerable alterations were made in the fourteenth and fifteenth centuries. The north transept is of the fourteenth century and has a stone roof.

Diversity of opinion exists as to its ecclesiastical history. Some hold it to have been a monastic church enlarged and adapted to serve the requirements of a parish. Others contradict this, and argue that it was only served by a monastic establishment.

Manorbier Castle.

According to Richard Fenton, the historian of Pembrokeshire, Manorbier Castle remains "the most perfect model of an old Norman baron's residence, with all its appendages, church, mill, dove house, fish pond, and grove still to be seen and traced." It is believed to have been built early in the twelfth century by Gerald de Windsor, the first Seneschal of Pembroke, who allied himself to the Welsh by marrying Nesta, of Carew Castle, the daughter of Rhys ap Tudor, Prince of South Wales. The same warrior is credited with the erection of Pembroke Castle. Manorbier is also ascribed to their son-in-law, William de Barri. But little is left of Norman work, for the castle was mostly rebuilt at the end of the thirteenth century. Mr. St. John Hope said it was best regarded as a castellated house; and in that light it made a valuable and interesting comparison with similar edifices in England. The gatehouse (circa 1270) is curious, with its arrangement of internal buttresses and curtain walls. On the opposite side of the quadrangle is what appears to have been the main living buildings, including the chapel, great hall and kitchen. Originally the chapel stood on the ground floor; later it was altered to the room above, and a broad external staircase was erected. Mr. Hope hesitated to definitely commit himself to the precise location of the kitchen. Here again the archæologist is handicapped by the presence of weed and creeper. The castle is picturesque in itself and on a picturesque site. It stands in a broad valley, which runs down to the sea, and may possibly at one time have been washed by it. It would have formed an ideal stronghold for piratical lords.

MANORBIER CASTLE.

Manorbier Castle may not have played a great part in war, but it gained a niche in history when Giraldus Cambrensis, a son of the above-mentioned William de Barri, was born here in 1147. This Gerald the Welshman won fame if not immortality, not by the sword but by his pen. His two best-known works are "The Topography of Wales" and his "Itinerary," the latter being an account of his journey through Wales with Archbishop Baldwin, of Canterbury, preaching the Crusade. As a historian of Irish conditions, however, he is regarded as unsafe and prejudiced. Giraldus, by reason of his birth, was always a person of importance, but in spite of all his efforts he never succeeded in gaining the bishopric of St. Davids. He at least was always faithful to Manorbier, and proved by the coldest logic that Manor Pyrr was "the Paradise of all Wales."

Wednesday, August 2.

St. Davids.

The concluding day of the summer meeting was devoted to St. Davids. The train was taken from Tenby to Fishguard, and the rest of the long journey was made in motor omnibuses through surroundings strongly reminiscent of Ireland. The two objects of attraction were the Bishop's Palace and, of course, the Cathedral. Both these lie within the very extensive precinct which the Bishops of St. Davids had carved out for themselves and surrounded by a wall. In the middle of the east side is the gatehouse, with bold towers on either side.

The Bishop's Palace.

The Bishop's Palace is a fine group of ruins lying almost due west of the cathedral. According to Mr. St. John Hope, M.A., the cicerone, the precinct of St. Davids is unrivalled for picturesqueness, though for general interest it must yield the palm to Wells. Through the middle of it runs a stream called the River Alan, on one side of which was the palace and on the other the cathedral. The wall of the Close, which extends to a mile, dates from about 1330. Only one of its four gateways remains. It was erected by Bishop Henry de Gower (1328-1347). This ecclesiastic belonged to a noble family which had settled in the English-speaking peninsula of Gower. He seems to have been more of an architect than a politician, for during his twenty years of office he was conspicuous for his building activities and munificence rather than for his prominence in affairs of State. He has been called in consequence the Menevian Wykeham. His work on his cathedral came at a critical time. But it was in the erection of the palace close by that his genius had full scope. Here is the great arcaded parapet which is only to be seen, as already mentioned, at two other places. The following description of the parapet, by Mr. Philip A. Robson, A.R.I.B.A., appears in Bell's guide to the cathedral: "It consists of a series of arches, with a hollow ornamented by Gower's four-leaved flower carried down on octagonal shafts, which rest on corbels of considerable variety about two feet down the wall. Above the arcade is a corbel table carrying a projecting battlemented cornice. The battlements have extremely narrow embrasures and loopholes. The sills of the arcade are steeply slanted outwards. Great richness is obtained above the arcade from the various coloured stones employed. They are set in squares alternately purple and grey, in the voussoirs of the arches and the spandrils above them, and make a mellow and harmonious chequer-work which greatly adds to the character of the whole building."

The buildings were apparently ranged round three sides of a quadrangle. On the east side were successively a room generally accepted as a small chapel, the Bishop's Hall (about 60 feet by 23 feet) and its kitchen (about 26 feet by 23 feet). On the south side was the Great or King John's Hall (about 96 feet by 31 feet) and the west chapel. Of the domestic buildings on the west side little remains. The whole forms, as Mr. Hope remarked, an extremely valuable example of fourteenth century domestic architecture carried out on a big scale. The lay-out, as already indicated, was simple. The principal buildings occupied two sides, the third was given up to those of less importance, and the fourth was filled by a wall with the gatehouse. This disposition was curious, though paralleled by that of Wells; the latter was mainly built by Jocelin (1206-1242), who seems to have been much the same kind of bishop as Gower. The kitchen here stands between the two halls, and no doubt served both. Each hall was entered from the quadrangle by its own porch

[illegible]

and staircase. As usual the first floor was given up to the principal apartments, while on the ground floor were cellars or crypts which may have been utilised for domestic offices, as they are lighted by good lancet windows (once glazed), as well as for storing food at such times as the bishop and his considerable retinue chose to reside here. The vaults are of the plain barrel type without ribs. The building immediately adjoining the gatehouse, which is usually described as a chapel, was believed by Mr. Hope to have been rather the almonry. The kitchen was a curious apartment. It was evidently domed. During the last fifty years the great stone chimney collapsed, and the masonry now lies on the floor. The arrangement was similar to that at Fountains Abbey—viz. four fireplaces back to back in the centre. The Great Hall had at one end a withdrawing chamber and other rooms. In the south-east wall is a beautiful rose-window which, unlike all the other windows, still retains its tracery. Evidently a very considerable amount of decoration was lavished on the windows. Mr. Hope suggested that the range of buildings on the south side, and not those on the east, formed the bishop's apartments. A curious feature about the palace is the lack of accommodation for servants. But it has to be remembered that the attendants were accustomed to sleep on palettes of hay and straw laid on the floor of the Great Hall.

It is said that the ruinous condition of the buildings began with an unworthy successor of Bishop Gower called William Barlow (1536-1548). He initiated the work of destruction, it appears, by removing the lead from the roof to provide marriage portions for his daughters, who married five bishops. Another reason for this action to make the buildings so unhabitable was that the Government would accede to his proposal of transferring the see to Carmarthen and the episcopal residence to Abergwili. In the latter he was successful.

The Cathedral.

After lunch the party assembled in the choir of the cathedral, where Mr. St. John Hope gave a brief account of "this wonderful church." The plan,* he said, was in itself peculiar, because the east end now included so many additions that its original disposition had become almost obliterated. On this site stood the monastic church founded by St. David which was destroyed by fire in 645. Of the two others which followed no traces remain. The present building was begun in 1180 by Peter de Leiâ, the third Norman bishop, who died in 1198. It is therefore contemporary with the work at Wells of Bishop Reginald de Bohun (1174-1191). But whereas at St. Davids they rigidly kept to Romanesque, at Wells Early English was boldly used. A more accurate comparison is afforded by the ruined Lady chapel at Glastonbury. Of the church of Bishop Peter we have the entire nave and parts of the transepts.

What the east end was like must remain uncertain, for what exists now was not his work but represents a rebuilding which took place about twenty years after. Leiâ's Norman detail was then closely followed, though the arches were made pointed instead of round. Soon after the completion of Peter's work—*i.e.* in 1220—the central tower fell. Mr. Hope doubted whether this mishap would have done as much damage to the adjacent parts as is usually represented. One reason was that the tower being Norman would not have been carried to any great height. Probably the tower collapsed into the open space immediately underneath it and left the eastern arm practically untouched. While the necessary rebuilding was taking place the parishioners seem to have utilised the gateway to the south-east of the cathedral as a belfry, or rather erected a detached semi-circular tower adjoining one side of it. This would obviously be a more logical place for it than a campanile buried in a hollow.

Very soon afterwards the aisles were extended eastwards, first to the high altar and then about 40 feet beyond it, so as to form chapels. A cross piece was then erected so as to give a means of communication between these two projecting aisles and to allow of processions making a complete circuit. Next they struck out still further eastwards by adding a Lady chapel. As will be seen from the plan, this was by no means in accordance with the axial line of the cathedral, being nearly five feet to the south of it.

The presbytery was originally meant to be vaulted; but, like many other intentions in this building, this was never carried out. In the second quarter of the fourteenth century a great deal of reconstruction seems to have been begun under the great Bishop Gower. It included the south choir aisle, the pulpitum, and St. Thomas Chapel, now the chapter-house with the treasury over. This chapel corresponds in position with a large two-storeyed chapel at Lincoln, which was destroyed in the beginning of the eighteenth century. It may have served as a vestry, treasury, or as a storage place for the large stock of vestments. The arrangement of the imposing stone pulpitum is most unusual, and is only approached by that at Southwell, which has practically the same treatment of vaulting. This rood-loft was declared by John Carter to be the most perfect work of its class surviving. The pulpitum seen by the party at Ewenny Priory was different to that at St. Davids, for whereas the former has an arched opening each side and the altar in the centre, the latter has an altar on each side and the entrance to the choir in the middle.

St. Davids being a church of secular canons the arrangement of the choir is, said Mr. Hope, exactly what might be expected. The bishop sat on his throne on the south side as if at the head of his chapter. The stalls, with their fascinating miserere carvings, are believed to have been executed in the time of Bishop Tully between 1460 and 1480. The reigning sovereign of Britain holds the first prebendal stall here. It is marked by a small brass plate bearing the royal arms. The choir is separated from the presbytery by a so-called "sanctuary" screen. Mr. Hope clearly showed that this was not a sanctuary screen and was not in its correct position, and that it originally served as a fence screen to the pulpitum altars standing on the top of the steps across the first bay of the nave. It is now askew and is obviously too wide. The wooden screen has tracery of a simple but very pleasing character.

A curious feature of the cathedral plan was an open space or well left between the east wall and the passage connecting the projecting aisles. This was in the fifteenth century described as "vilissimus sive sordidissimus locus in tota ecclesia." Bishop Vaughan (1509-1522) took possession of it and converted it into a most beautiful Perpendicular chapel, which is known by his name though dedicated to the Trinity. To do this he filled in the three large lancet windows at the back of the high altar. It is probable he substituted for them a broad and low Perpendicular window above. At present the three original lights are blocked up, while above are a group of four lancets introduced by Sir G. G. Scott in his extensive works in the middle of last century, in the place of a decayed fifteenth century window.

The present unique nave roof is generally accredited to the Treasurer Owen Pole (1472-1509). Mr. Hope said that the elaborate wooden carving, and particularly the pendants, showed traces of Flemish Renaissance work such as is not generally seen in this country until the end of the sixteenth century. But he was inclined to date this example about 1530.

For its monuments alone St. Davids would be remarkable. These include the shrines of St. David and St. Caradoc on the north side of the choir. It was suggested that the latter was moved to its present position from some other part of the building. It is obviously a piece of patchwork. Particular attention was drawn to four unusual effigies of clerks in holy orders clothed in amices, albs, crossed stoles, and dalmatics. The presence of the dalmatics instead of the ordinary chasubles may be taken as proof that they commemorated archdeacons. Bishop Gower's tomb is under the pulpitum.

The College of St. Mary was founded jointly by John of Gaunt, Duke of Lancaster, his wife Blanche, and Bishop Adam Houghton in 1377. The ruins stand to the north of, and parallel to, the nave, from which it was separated by the square cloister, of which nothing is now left. There are considerable remains of the large hall over a subvault.

St. Davids appeared in Vol. lxxvi. of *The Architect* cathedral series.

At the conclusion of the visit the party were entertained to tea by the Dean of St. Davids. This marked the conclusion of a summer meeting which was greatly enjoyed by all who took part. Everything went off without a hitch if we except two trains which were intractable to the best of organising secretaries.

Our plans in this and previous issues recording the visit are taken from the programme issued by the Royal Archæological Institute, and we are indebted to the courtesy of Mr. G. D. Harding-Tyler, M.A., F.S.A., the secretary, for permission to use the blocks. For our small photographic views we have to thank the Great Western Railway Company, who had them prepared for their interesting booklet "South Wales: the Country of Castles."

* See Supplement, page 13.

THE DESTRUCTION OF CEMENT AND CONCRETE.

(Contributed.)

THE two most important building materials at the present time are steel and Portland cement. There is no subject upon which a greater number of researches—many of them very expensive—have been carried out than the physical properties of steel. During the last half century many scientific papers have appeared in the Proceedings of the Royal Society, the Physical Society, the Institutions of Civil and of Mechanical Engineers, the Iron and Steel Institute, &c., in this country; while in Germany and America the experimentalists have been equally active. The engineering press of all countries have frequent references to the work which is being done upon the elasticity and strength of steel and its alloys. An exactly opposite state of affairs exists with regard to Portland cement. There has been a remarkable laxness in the study of this important material. There may be certain reasons, of which the following seem feasible.

In the early days of the Portland cement industry the substance was used almost entirely for structures, such as foundations, where it was constantly damp. Under these circumstances it did well (as we should now think), and the somewhat rule-of-thumb designer of the period very naturally did not worry about the properties of a material which always answered well in practice. The confidence with which it came to be regarded was possibly, in an unthinking manner, transferred to conditions where cement is less stable.

Changes in Volume of Concrete.

This has been determined with considerable accuracy for the case of change due to temperature. For unit length it may be taken as 0.0000055 per degree Fahrenheit. But there are other changes due to the chemical processes of setting and hardening. These are barely mentioned in even the more important treatises. Other variations, due to the wetting and drying of the concrete, exist, but the fact is practically unknown, and there are certainly no quantitative measurements. Professor Alfred H. White, of the University of Michigan, has made some experiments, the results of which he has recently (July 1911) communicated to the American Society for Testing Materials. Before dealing with his tests it will be wise to mention a few results to be found recorded in the very brief literature on the subject.

The classic experiments of Bauschinger, published in 1879, seem to be the starting point. He made quantitative measurements of the change of volume of cements while hardening takes place. He tested eight different cements, made into small cubes of neat cement and 1.3 to 1.5 mortar. One set of cubes was kept in water and one in air. The changes in the length of one side were observed for sixteen weeks. Schumann (1881-9) made expansion measurements on blocks not only of neat cement and cement mortar, but also on blocks of building stone. Gary (1899) published the results of tests on ten Portland cements, which included measurements of expansion bars of neat cement and of 1.3 mortar placed in water. No tests were made of bars in air.

Campbell and White (1906) published a study of fifty-six expansion bars of neat cement, which had been under observation for five years. Many of these were pathological specimens of unsound cement containing free lime and magnesia. Their experiments showed as much as 0.19 per cent. expansion with sound neat cement kept in water for five years and a shrinkage as much as 0.39 per cent. with bars of sound neat cement kept in air. A reliable and inexpensive micrometer, together with a satisfactory method of inserting the glass plates in the expansion bars, were described in the communication made by these two investigators to the *Journal* of the American Chemical Society (1906). The concordant results obtained by Campbell and White were doubtless due to the refinements made in their apparatus.

The following table gives the results obtained by the investigators—condensed for the purpose of saving space. Averages of from four to eight results are taken.

Table showing change in volume of bars of Neat Cement and Cement Mortar lying in water, compiled from papers and experiments noted above.

Authority.	Neat Cement. %	1:3 Sand. %	1:5 Sand. %	Duration.
Bauschinger . . .	+0·046	+0·009	+0·001	16 weeks
Schumann . . .	+0·150	+0·028	—	1 year
Considère . . .	+0·079	+0·028	—	63 days
Campbell and White . .	+0·190	—	—	5 years

All of these results are for specimens which were lying continuously in water.

We now come to study the results obtained upon specimens which were allowed to remain continuously in air. In this case it will be noticed that there is *contraction* (signified by the minus sign) in the place of *expansion* (signified by the plus sign) shown above.

Table showing changes of volume of bars of Neat Cement and Cement Mortar, after lying continuously in air, compiled from papers and experiments noted above.

Authority.	Neat Cement. %	1:3 Sand. %	1:5 Sand. %	Duration.
Bauschinger . . .	−0·214	−0·132	−0·124	16 weeks
Schumann . . .	—	−0·042	—	1 wk. in water, 3 wks. in air
Considère . . .	−0·132	−0·050	—	63 days
Campbell and White . .	−0·390	—	—	5 years

Table of changes in volume of Brick and Stone when alternately wet and dry: Schumann's Experiments.

	2 Weeks in Water. %	2 Weeks in Air. %
Brick, light burned red	+0·016	−0·015
Brick, hard burned white	+0·010	−0·009
Sandstone, red coarse	+0·016	−0·023
Sandstone, red fine grained	+0·050	−0·050
Limestone, white	+0·004	−0·008
Limestone, dense containing clay . . .	+0·026	−0·026
Granite	+0·006	−0·015
Basalt . . . A, b, c, d varies from	+0·048 to +0·023	−0·057 to −0·027

Reinforced Concrete.

Very few investigators have published results upon the most important subject of volume changes in reinforced concrete. In 1899 Considère gave the results on small bars of neat cement and of mortar made with 600 kg. cement to each cubic metre of sand. The prisms were 60×25×600 mm. Half of them were reinforced each with a round steel bar 10.2 mm. in diameter. The measurements extended over a period of sixty-three days, and at the close of the period the following changes were reported:—

Material.	In Water.	In Air.
Neat cement not reinforced . .	+0·079	−0·132
Neat cement reinforced . . .	+0·022	−0·025
Mortar not reinforced . . .	+0·028	−0·050
Mortar reinforced	+0·006	−0·010

In 1904 Emerson published in the *Engineering News* (U.S.A.) a study of the change in length of the reinforcement. The changes in length of the rods were measured and the resulting stresses in the steel were calculated from Hooke's law. The bars kept continuously in water had a tension stress of 8,000 lb. per square inch when bedded in neat cement and a tension stress of 1,000 lb. per square inch in 1:3:6 concrete. With bars kept constantly in air the steel was under a compression stress which was generally greater than the tension stress in the bars kept under water. It was found that when the bars were taken out of the water and left to dry in air, the stresses in the steel changed from tension to compression as the bars dried.

Summary of all Results.

We are now able to see the exact position of affairs until Professor White made his experiments. It was known, from the above experiments, that the neat cements, hardening under water, expand at a decreasing rate for several years. Also that neat cements hardening in the air contract in a similar manner. Further, that cement-sand mortars change in the same direction as the neat cements, but to a lesser extent. On the whole, however, we really have very little definite data upon the physical properties of cement, concrete, and reinforced concrete. Moreover, it must be borne in mind that there have been introduced changes in the method of manufacture of cement since many of these results have been obtained. For example, the European investigators mentioned above certainly used cements made in the old vertical kilns. Professor White reminds us that the modern American cement which he used in his work is made in rotary kilns, and differs from the older material not only in manufacture, but also in chemical composition.

(To be concluded.)

ILLUSTRATIONS

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

OUR inset plates this week show some of the buildings visited by the Architectural Association on their excursion to Touraine, and are reproduced from photographs and measured drawings lent by Mr. Banister F. Fletcher, F.R.I.B.A.

SHOREHAM AND ITS DISTRICT.*

SHOREHAM was an important place in Saxon times. Remains of Roman villas have been discovered in the neighbourhood. Skeletons with flint implements were found in one of the barrows on the down when it was opened out some years since, and the evidence of very early earthworks for defensive purposes are numerous enough along the top of the grandly rounded chalk hills. Therefore its history is long and honourable. In speaking of Shoreham, I refer to the sea-port at the mouth of the river Adur, which flows through the gap in the downs we know as Shoreham Gap.

Now I believe that before Shoreham came to be, Bramber was the important place. In the earliest times men seemed to favour as the sites of their principal settlements some spot, not at the river's mouth, but a little way up the stream, and in Saxon times the estuary of the river must have been very wide, as far at least upwards as Bramber; and here, on a spur of the hills, precipitous on three sides, a castle was built, which was the residence of the local royalty of that day. King Ethelwulf, father of Alfred the Great, who was buried in the church of Steyning hard by, used Bramber Castle as one of his palaces. It is mentioned in the Domesday Survey as existing at that time, and was one of the manors handed over by William to the barons who had assisted him in his great conquest. In this particular case William de Braose thus became the owner, and along with it numerous manors and lordships in the immediate locality.

NEW SHOREHAM CHURCH.

Population always gathered round these castles, partly for protection and partly from commercial motives; and thus in the centuries preceding the Conquest Bramber was probably the chief town. The river Adur, however, like many other rivers, particularly at their delta, was rather an uncertain quantity, and owing to the almost constant shifting of the outfall silting up was constantly going forward, so that by the ninth or tenth century it was needful to strike camp and move lower down the river to a point where ships could reach without difficulty from the sea; hence the founding of "Shoreham," meaning, surely, "The Home by the Shore." This was, at the first instance, at the river bend, where we now see Old Shoreham. The glory of the place, however, was but short-lived, because no steps were taken o control the effects of the tide upon the shingle bar across he river mouth, and as a consequence alternations of flooding and silting followed, rendering a further move downward necessary, and the town we know as New Shoreham came into xistence during the closing years of the eleventh century; nd with Shoreham rising Bramber became but a village.

Shoreham, from the twelfth to the seventeenth centuries, was one of the chief sea-ports of the South of England, ranking at one time equal with Portsmouth and superior to Dover. Being at the mouth of a river, it was conveniently placed for shipbuilding, owing to the plentiful supply of oak, obtainable from the Wealden forests, and the deep water at full tides n the estuary, rendering launching easy. In the third Edward's day Shoreham provided twenty-six vessels and 336 men as its contribution to the national fleet. In the days f the filibustering era of the sixteenth century Shoreham made its contribution of dare-devil commanders and hardy seamen, whose piracy was counted patriotism. Since that date, however, its fortunes as a marine manufacturing seaport have gradually declined, and its activities in that direction are now mainly restricted to pleasure-yacht construction and repair.

The district must have been largely populated at the arrival of the Norman conquerors, judging from the fact that there are as many as twelve churches bearing the unmistakable mark of their work within a radius of five miles. This fact renders the district unique. Taking the churches in the order in which we have visited them to-day, I will mention a few of the points which call for your attention.

St. Mary's, New Shoreham.

This building was originally much larger, and contained an extensive nave and aisles in addition to the present choir and transepts—there are still to be seen traces of the old walls and foundations of this extended building.

It was founded by William, third Baron de Braose, in 1130, when the inhabitants had shifted from the old town and were building New Shoreham, though there is reason to suppose that a chapel existed on the spot at an earlier date, because we find that the De Braose of 1103 by deed conferred the church and its revenues on the Abbey of St. Florence of Saumur, who had established a branch of their house at Sele, not far off, now known as Upper Beeding.

William de Braose's building was partly rebuilt by the fourth Baron in the form we see now. Begun in 1175, it was completed early in the thirteenth century. With nave, aisles, transepts and choir it must have been a grand building. Why the nave was demolished appears to be uncertain; but I think that the remains now visible would indicate that it was accidental; and the opportunity was taken in restoration to reduce the size of the building owing to the decay of the numerical importance of the town population. As this church dates from quite late in the Romanesque period, it exhibits the richness of detail we should expect at a time when the feeling of the builders was making for profusion of ornament rather than the grand simplicity of the earlier artists. Hence the choir arcading is rich in scrolls of leafage, instead of the geometrical patterns we see at Steyning and other places. It is an early instance of transitional work, as you have clustered columns on the south and circular ones on the north side of the choir; while in the arcade itself, which is pointed on both sides, you find the sunk, undercut mouldings of the Early English, which, although undoubtedly all of the same period, differ from one another in section—those on the north side being round, and those on the south pointed.

OLD SHOREHAM CHURCH.

The column caps to the north arcade are noticeable, the ornament consisting of Classic volutes, all turned one way as if wind blown, some plain volutes, and some foliated. It is also noticeable that, while the aisle windows and arcading are Romanesque, the vault piers, capitals, and mouldings are of a more advanced style.

I believe that the builders of this church must have been among the first to recognise the necessity of the flying buttress as a counter-action to the thrust of the main roof vault that they had introduced, and the form and slope of the buttress that they thus invented you can see was somewhat experimental, for it is obviously at too flat an angle to do the best work in transferring the thrust. This may have been recognised by them, for they have surmounted them with extraordinarily heavy pinnacles of the plainest type, placed partly on the aisle wall buttress and partly on the foot of the flier itself.

---

* Read at a meeting of the Upper Norwood Athenæum by Mr. rederick Higgs.

There is an indication of the roof line of the chancel of William de Braose's building still traceable on the east wall of the tower arch inside the chancel.

There is a sign of a holy water stoup on the piece of south nave wall left standing, high up, a little above the level, as I suppose, of the ancient rood loft, and doubtless used by the priest from that elevated situation to sprinkle the worshippers on the nave floor below.

There is a fifteenth century brass, of no very great interest, and the old square font is of Sussex marble, and undoubtedly Norman in period.

To sum up: This building is one of the most interesting churches in existence, as setting forth the advance from the simple forms of the Norman-Romanesque, a movement of architectural thought which was destined to develop to such an astonishing extent during the succeeding centuries.

St. Nicholas, Old Shoreham,

was probably erected in pre-Norman times, at least so far as the main structure is concerned, which is built in too rough a manner, it is thought, to have been the work of the Normans. This is confirmed by Domesday Book. De Braose, the first Lord of Bramber after the Conquest, no doubt remodelled and largely rebuilt it in the form now apparent, after which he presented it to the Monastery of St. Florence of Saumur. By the middle of the eighteenth century it had fallen into considerable disrepair, and it was then restored, when it is said that care was taken to reproduce the old features as far as possible.

There are several noticeable architectural features here: the entrance doorway in the west wall of the south transept has a very beautiful arch in three orders; triglyphs, zigzags, and pateræ. Two or three very beautifully moulded oak tie beams in the roof, having dog-tooth and billet ornaments cut thereon. The ancient oak screen is also a very good specimen of early joinery work, though plain in detail. The four arches carrying the tower are most elaborately moulded, having a label of pateræ with curious figures as bosses at feet, next, diagonals or zigzags with roses and occasional leaf ornament, then a big bead or bowtel, with a square order as a foundation. The most remarkable feature, however, is the very curious and unique zigzag all round the outside of the narrow slit windows in the north and south transepts. The nave, transepts, and tower are the ancient part of this building, the chancel having evidently been built much later.

Our way from Old Shoreham follows the old road along the river valley to Beeding (formerly Sele), site of the old monastery before mentioned, a branch establishment of that of St. Florence of Saumur; and we cross the river over a small bridge, the site of an ancient and more interesting one. In 1320 the Bishop's register mentions a chapel constructed on the bridge at Bramber, and dedicated to St. Mary the Virgin; it was excused, on the ground of poverty, from contribution to the taxation instituted by Bishop Langton, and in 1368 the Bishop of Winchester granted forty days indulgence to all who would help to repair this bridge, which is thought to have extended almost as far as the Castle, as a sort of causeway over the flooded low-lying marsh land.

Entering Bramber, the most picturesque of Sussex villages, we pause at St. Mary's House, a splendid sixteenth-century timber structure formerly connected with the monastery at Beeding—it is mentioned among the old records of this monastery as the Chapel House. Noticeable features are the beautiful wrot iron work in the window guards, entrance gates, bell-pull, and bracketed sign of a griffin carrying a key. and, just inside the gates, the two elaborate Jacobean door posts. There is a charming garden front, long, low, and picturesque, with a stone-covered, dormered roof with overhanging eaves surmounting quaint bracketed windows.

The site of the castle is on the north-east side of the street, and the hill upon which it was constructed covers three acres. Very little remains of its former grandeur, a few pieces of the curtain wall, including a pier or two of the gateway, and a large mound, covering most likely the ruins of the keep and the principal apartments, otherwise Nature, in her own quiet, imperceptible, and yet irresistible way, has obliterated everything. Probably the residence of kings in Saxon times, it was granted by the Conqueror to his henchman, William de Braose, and remained in his family's possession until the De Braose family subsequently became merged in that of De Mowbray, and later in the Howards. It is stated to have been destroyed in the Parliamentary wars.

The name "Bramber" is Saxon, and indicates "a strong place," and such was evidently its character when in its prime. The castle was built upon a spur of the lower hills, naturally precipitous on three sides, the fourth being made so by the excavation of a moat or vallum. It commanded the river valley and the consequent approach from the sea as well as the land.

The little church of St. Nicholas, Bramber, on one of the lower slopes of the castle hill, is probably but a fragment of what it once was. It is now nave, tower, and chancel only. The main arch is simple Norman in character, and indications of the original transept arches are visible on the north and south tower walls. It was a rectory in 1075, and belonged, like the other churches we have seen, to the Monastery at Saumur, the patronage being now vested in Magdalen College, Oxford.

A short journey brings us to Steyning, a quaint old-world town, nestling under the downs, and possessing ample interest for the antiquary. Our chief point, however, is the grand Norman church of St. Andrew. It has an aisled nave with clerestory; but an unaisled chancel, and a western tower. Its chef-d'œuvre consists of the very beautiful nave arcade and the exceedingly lofty and ornamental chancel arch. You will have noted the wealth of Norman ornament on the arches; not only are the faces enriched in this way, but the underside also. Some of the ornament is left unfinished; the story goes that the monks had this work in hand, one arch, one monk, to do in his life-time, and the unfinished arches are where the artist did not survive to complete his job. This church (built within the first century after the Normans began to come), is a first-class illustration of the advance of ideas in architecture from the solid dignified simplicity of the earlier warrior priests and lords, the first move in the direction of embellishment taking a geometrical form. The dentil or billet course for the label, the dog-tooth and chevron, both zigzag in idea, sometimes small circular sinkings or pateræ, with internal circular ornament, which developed into a kind of rose form; but all these set out either with a straight edge or compasses. In Steyning we have this movement almost at its zenith, and a beginning made on to the further form of foliated ornament in imitation of leaf and flower, which is very noticeable in the column caps, where we find, in the cushions, a fern leaf introduced in between the inverted cones.

BRAMBER VILLAGE.

At the same time the builders had not yet advanced much in the matter of construction, as the Norman pilasters occur outside the aisle walls, forerunners of the buttresses which developed so greatly, and take such an important place in the Gothic periods which soon followed.

The clerestory windows present a curious feature, being differently placed within the thickness of the wall; one side they are close to the outer face, with the deep recess inside; while on the other side the reverse is the case.

The font is an ancient Norman one, with arcade ornament on the outside of the bowl stone; the south door is very old, with mediæval lock and latch, and inside the porch is an old stone coffin-lid, said to have covered King Ethelwulf's remains, who was buried within the church precincts.

Edward the Confessor conferred the manor on the Abbey of Fécamp, who continued to hold it until the suppression of the alien monasteries. As a consequence, a small branch of that house was established at Steyning.

It is probable that these monks erected the church, a fragment only of which we see to-day, as I am quite sure that builders who could conceive forms as beautiful as these fragments are would not have been content with so comparatively small and insignificant a sanctuary, containing, as it did, the shrine of St. Cuthman, who founded the original building, and about whom strange and mysterious legends are current. The original Norman building was cruciform, with transepts, chancel, and a nave, extending further westwards than at present, with probably a central lantern tower. The present western tower and chancel are both comparatively modern.

In the Vicarage dining-room is a remarkable piece of Tudor panelling, which must have formed part of the earlier building following the monastic period. It bears date 1532, and contains the arms of Henry VIII., combining those of France and England, and there is the Tudor Rose and the Pomegranate of Queen Catherine, while a constantly recurring monogram is as yet unexplained. The arms of a Bishop are also frequent; this probably had reference to our old friend Waynflete, the builder of Esher Palace, which we have visited.

After the suppression of the alien religious houses the Priory passed into the hands of Sion College, and then into the hands of Waynflete, who devoted its wealth to Magdalen College, Oxford. The existence of this panelling is very little known, and we are much indebted to Mr. Pridgeon, the Vicar, for his courtesy in letting us see it to-day.

At Sompting Village we turn towards the church, lying some distance from the highway, in the direction of the Downs. This church is noted mainly for its unique Saxon west tower. A square on plan, each side having a high-pitched gable, whose sloping sides are joined by a roof, which, continuing up to a point where all the sides meet, assumes the appearance of a pyramid with the corners cut off. There is a light wall pier, or pilaster, running up the centre of each side up to the apex of the gable, each having an enriched cap about two-thirds up its height. There are small circular headed windows in the walls indicating the Norman feeling, which was then making way.

SOMPTING CHURCH.

Internally the church is very interesting, mostly dating from the twelfth century. The capitals carrying the tower arch are extremely interesting as showing the imitative efforts of the late Saxon builders—in a very rustic way one is a copy of an Ionic capital, while the other is still a ruder attempt at the Corinthian acanthus leaf group. There is some good groined work, both in the chapel of the south transept, now used as a baptistery, and in the north transept.

There are two ancient sculptured panels, one on the east wall of the south transept represents a Bishop, conjectured o be St. Wilfred with his staff; this panel probably formed part of a triptych, descriptive of three of the learned doctors of the early Church, or it may have been part of a former reredos; the other is on the north nave aisle wall, and stated to have formerly been outside, represents our Lord, with a book in one hand, and with the other conferring benediction. The signs of the four Evangelists are in the borders.

There is a canopied tomb of Richard Burré, member of an ancient yeoman family in the district, and bearing shields with the arms of Leathersellers, Goldsmiths, and Fishmongers' Companies of London, and which used to be utilised as an Easter sepulchre. The present lay rector bears the same name of Burry.

LANCING CHURCH.

There are some ancient ruins outside the north-west corner of the nave of a chapel dating from the fourteenth century. This was probably a chapel of the Knights Hospitallers, who inherited adjoining lands from the Templars at their dissolution in 1306. The font is ancient, and probably coeval with the church.

I am grateful for the support and the patience which you have afforded me; also to the good Vicars of Steyning and Sompting, and to the authorities of the other churches visited; to your chairman for his invaluable assistance in the organisation of the travelling and feeding; and, lastly, to the authorities whose works have afforded me ample quarries of information in preparing this paper, viz. Cartwright's and Horsfield's Histories of Sussex, the "Homeland Handbook" of the district, and that wonderful treasure-house, Bond's "English Gothic Architecture."

CALCULATIONS FOR RETAINING WALLS.

(Concluded from last week.)

23.—*Analysis of the Earth Pressure.*

If a steep bank of earth—such as the edge of an excavation —be left to itself for some time it will fall in under the effect of the weather, and will gradually become flatter in inclination until it alters no more.

The angle its inclination, when at rest, makes with the horizontal, is called the "angle of repose," and, of course, varies with the various kinds of earths. (*See* Table VI.)

Table VI.

Angles of Repose of Various Earths (Hurst).

	ϕ
Vegetable earth or clay in its natural state .	45°
Moist gravel and sand	38°
Wet excavated earth	36°
Fine dry sand	32°
Clay saturated with water	25°
Clay recently excavated and saturated with water	15°

In fig. 12 the angle of repose is denoted by the letter ϕ

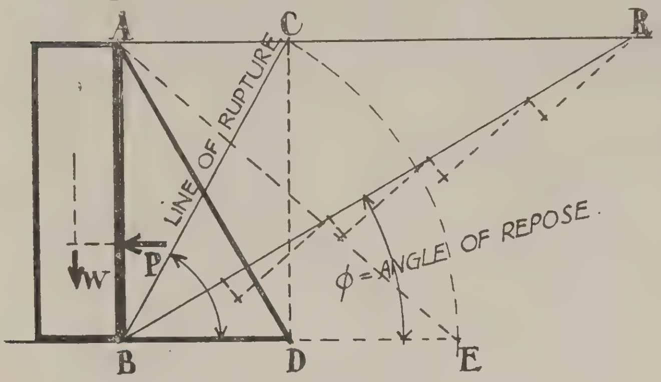

FIG. 12

It will be evident that the earth below the line BR will have no effect upon the wall.

If the wall were removed the earth represented by the triangle ABR would alter its shape until the face AB assumed the inclination of the angle of repose. But now that this earth is held by the wall it is like a wedge bearing upon the earth below it and upon the wall. The thrust of a wedge is equal upon both supports, so that the wall takes one-half the thrust of the triangle ABR, and the earth below the angle of repose the other half. The actual thrust, then, is represented by the triangle ABC, where BC bisects the angle ABR. BC is called the "line of rupture."

24.—*The Actual Pressure of the Earth.*

This is now represented by the triangle ABC (fig. 12).

Assume the earth to be very loose, as this will be its worst condition. In this state the pressure at any depth is exactly the same as it was for water—equal to the weight vertically above it and the same in all directions.

That is to say that at B the pressure is equal to the weight of a column of the earth of height BA.

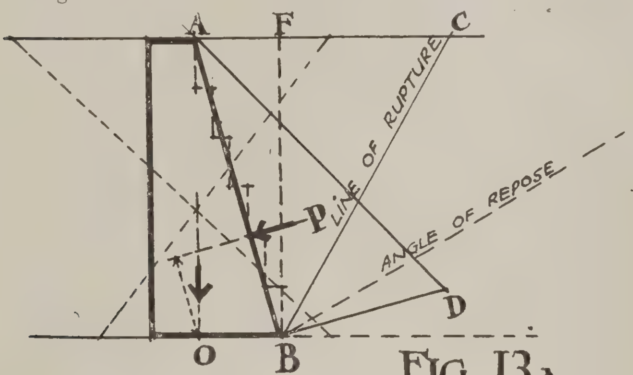

FIG. 13A

This would give us a triangle of pressures like ABE, where BE = AB. But as we have not a total pressure in ABD as great as this the triangle of pressure must be reduced so as to be equal to ABC. This is ABD, where BD = AC.

The thrust at any point is the ordinate of the triangle ABD at that point, and the total thrust P = area of the triangle in feet × length of the wall in feet × weight of earth per cubic foot, and it acts through the centre of gravity of the triangle at ⅓ the height of BA. The stresses on the joint at the base can now be found and the wall designed.

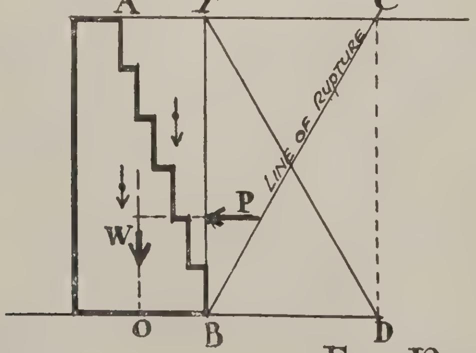

FIG. 13B

25.—*Wall with Sloping Back.*

Such a wall is shown in fig. 13A. The line of rupture is BC, found as before.

The earth represented by the triangle AFB is neglected. The earth producing the thrust is represented by the triangle BFC. Draw BD normal to AB and equal to FC.

Then the triangle ABD represents the sum of the pressures, and P acts through its centre of gravity normal to AB, its leverage being about O, as before. It is customary in walls of this section to build the back with off-sets. This gives authority for the assumption that the earth AFB acts with the wall. The method of working is shown by fig. 13B.

26.—*Surcharged Walls.*

When the earth behind a wall is not horizontal but is sloping upwards the wall is said to be surcharged.

In fig. 14 produce the line of rupture until it meets the line of the surcharge. (Note that the angle of the surcharge with the horizontal cannot be more than the angle of repose.)

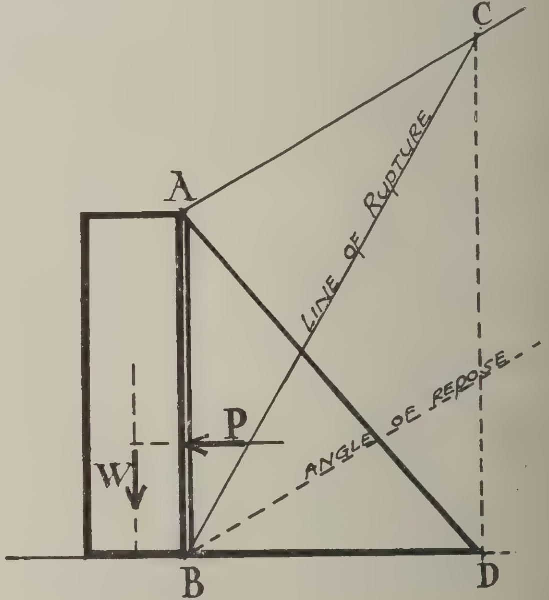

FIG. 14

The triangle ABC is then the wedge of earth affecting the wall. Draw a perpendicular from C to D.

The triangle ABD represents the pressure, and P acts through its centre of gravity normal to the wall.

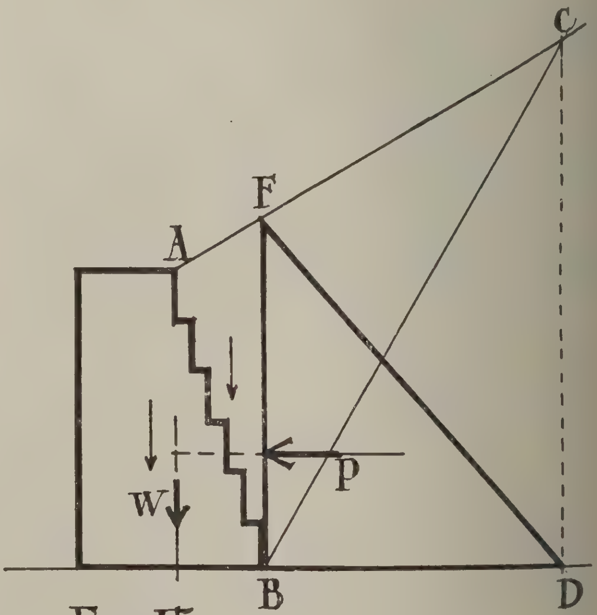

FIG. 15

In fig. 15 the earth AFB acts with the wall, and the triangle BFC is the wedge of earth affecting it. BFD represents the pressure, and P acts through the centre of gravity at one-third the height BF.

THE ARCHITECTURE OF LONDON HIGHWAYS.

By "Viator."

CLUBLAND, ANCIENT AND MODERN.—ST. JAMES'S STREET AND PICCADILLY.

IF it was considered desirable, in the previous article, to avoid the use of the word "Clubland," it is certainly justifiable to use it in connection with the thoroughfares now to be passed in review; for in St. James's Street are situated the clubhouses of more remote date, whilst in Piccadilly are congregated the majority of the more recent establishments, including even the Royal Automobile Club.* The latter, however, as we saw, is preparing for itself a noble habitation in Pall Mall; this thoroughfare (it may be observed) was the original home of some of the earlier clubs, which afterwards migrated to St. James's Street.

It would have been more in accord with our own wishes to have comprehended within the limits of one article the consideration of Clubland; but though the eyes and brain of us never weary in perusing our lucubrations, it seemed only kind to the readers of *The Architect* to cut (we cannot say "short") the previous article before completing the review of the clubhouses of the West. Some of these will still be off the track, but before this account is ended, London Clubland will have yielded up to zealous research most of its domiciles.

These social centres had their origin in the old coffee and chocolate houses established in the early years of the eighteenth century, subsequently (in some cases) taking form as proprietary clubs, which were farmed out and in process of time gained reputations which would in these days be considered unenviable, in view of the high play and large stakes involved. Of such character were Almack's, Crockford's, White's, the Cocoa Tree and others.

White's Club was founded in the early years of George II.'s reign and was removed to its present location at the north end of St. James's Street in 1755. The architecture of the club has been assigned—but probably erroneously—to James Wyatt. Alterations were effected a century later, at which time were added the bas-relief medallions of the Four Seasons, designed by George Scharf. Despite the use of stucco, a good deal of interest attaches to the facade, which is well-proportioned; the shallow rustication above contrasts well with the bold V-jointed treatment below, but a note of weakness is struck in the central glazed lunette to the first floor. The Ionic Order for the pilasters is satisfactory, having the grace of a refinement somewhat lacking in the other Orders. The distributed ornament is of the delicate Adams type, which is very pleasing; equal satisfaction attaches to the good cast ironwork. The ground storey bow-window here, so historically famous, is a prevalent feature in the clubhouses of St. James's Street. It is to be seen on Boodle's Club, erected in the early years of George III. by Robert Adam, additions being made by John B. Papworth in the reign of George IV. This is a pleasing bit of work, set between more modern blocks. The effect of the central mass, flanked by the slightly higher wings is not unsatisfactory, and there is distinct pleasure in encountering a partial display of brickwork, when elsewhere so much stone and stucco are to be seen. As might be expected, the ornament is in the latter material, and characteristic griffins confront us over the flank windows of the first floor.

Brooks's Club gained its earliest reputation under Almack, whose name it first bore; its original home was in Pall Mall, where it occupied (1764-8) the site of the present Marlborough Club. It was the social centre of Whiggery, a position held by the St. James's Chocolate House in the days of good Queen Anne. The architect was Henry Holland, and he cannot be altogether congratulated on the result of his labours; for the front of the building is devoid of inerest, though the flank façade provides some satisfaction or the gazer. The deep brick niches of the ground storey re meaningless in the absence of statuary; but this is a efect so common to buildings, that there is great danger of the lapse from Art being overlooked.

There is a sensation of relief in turning towards the Cocoa Tree Club, also on the western side of the street, like the revious building, and like it also in being originally domiciled in Pall Mall, as a chocolate house where the Tories were wont to resort. It was constituted a club in 1746. The uiet stucco façade presents to the gaze a reversed superosition of the Orders, and though this may be academically incorrect, yet with the treatment accorded, the freedom from academic shackles may be understood. The effect of the central pediment, supported by flanking balustrades, is also satisfactory. But with an increased sense of pleasure, attention may now be directed to Arthur's. This, though founded nearly a century and a half ago, occupies a building designed within the period of men still living, being the work of Thomas Hopper in 1825-7. This is a stone-fronted house of the Corinthian order, surmounted by a good balustrade, quiet, dignified and expressive of its purpose: the sole adverse criticism to be offered here is that the columns are too squat, lacking the sense of proportion, which has been adjudged by experience suitable for the Corinthian Order. This building may be compared with the Conservative Club further south in the thoroughfare, the work of Sydney Smirke and George Basevi (1843-5); it forms an interesting pendant design to Arthur's. On each there is the first floor range of Corinthian columns, but the latter are well-proportioned on the Conservative Club, though it must be admitted that the plain shafts are not so pleasing as Arthur's fluted columns; despite this, the Conservative house is the more ornate of the two, without being too ornate. The effect, also, of the central colonnade flanked by pilastered wings is good, the entrance in one being balanced by the customary ground floor bow-window.

Still another Club is associated with history. The Devonshire, over against White's, occupies the house that was formerly Crockford's, and designed in 1827 by Benjamin and Philip Wyatt. After vicissitudes, it assumed its present appearance in 1873 under the capable hands of C. J. Phipps, the former stucco front giving place to the present stone façade; the effect is Wrenesque in a general sense, and more particularly so on the second floor.

The Thatched House is historically interesting, by reason of the fact that "The Club" (or, as it was subsequently designated, "The Literary Club") met here, migrating from other premises in St. James's Street. "The Club," conceived by Sir Joshua Reynolds, enrolled amongst its members many of those who have been eminent in letters, and included also some who have had perchance "greatness thrust upon them." The building itself does not bear being lingered over; the ornament is very florid, though it is partially kept under restraint by large plain wall surfaces. The two-storey shallow oriel is not a pleasing feature. Another building with an unpleasantly florid effect (and it is rather an effect than a fact) is the Royal Societies Club, and over this also there is no inducement to linger. But in the New University is exhibited a building whose Gothic design affords a welcome change from what has hitherto been viewed. Mr. Alfred Waterhouse is usually inspiring, and in the present instance his vigorous apprehension is largely in evidence; the building is instinct with life, but it is the life of the byways, not of the highways. The employment of carved shields, showing the arms of the various colleges, used for the adornment of the string-courses, and the University shields set in the entrance gable serve to recall the treatment accorded by Mr. Reginald Blomfield to the United University Club in Pall Mall East.

Before entering Piccadilly there are a few buildings calling for attention, where club life is not an element. No. 5 St. James's Street,* the work of Messrs. Bœhmer & Gibbs, is a quiet decent façade, which, if not altogether well-proportioned and perhaps also looking somewhat like a house on stilts, yet possesses qualities of refinement and fitness, and the free and unpanelled ornament of the second floor is distinctly pleasing. Lord Byron, who was born in Holles Street, Cavendish Square, lived for a period at No. 8 St. James's Street, and an uninteresting façade is obtruded upon the notice of the wayfarer by means of a high relief medallion portrait of the poet "Pilgrim of Eternity" similar to what may be observed on and in Byron House in Fleet Street. It has been truly said that every house has a history, but its public record may be easily overdone.

With a sense of artistic pleasure reference must be made to an interesting modern building on the western side of the street and adjoining Arthur's — to the premises occupied by Messrs. Chubb. In these days of the Stone Age it is a relief to view this red-brick elevation with its three-storey bay flanked by brick Ionic pilasters and their shielded bosses beneath; the whole effect is that here is presented a building looking well now and destined to wear and weather satisfactorily to a green old age. Of other modern work in the thoroughfare, let it suffice that better and worse may be encountered every day; worse will assuredly be met with in

---

* Since writing this article the club has been transferred to all Mall.

* See *The Architect*, November 25, 1904.

Piccadilly, which has now been reached after a somewhat zigzag tour hitherto.

In traversing Piccadilly there is apparent in the first place in regard to the clubhouses a great general difference from those in St. James's Street and Pall Mall; whereas in the latter thoroughfares most of the houses are built for the specific purpose, in Piccadilly a large number are merely adaptations of private dwellings—with some notable exceptions, however.

It is not often that two adjoining clubs have the same creator; in Pall Mall there are the two by Sir Charles Barry, and here in Piccadilly are the Badminton and the Junior Constitutional Club designed by Robert W. Edis. The former dates back twenty-seven years, and is a neat little building, unobjectionable and unobtrusive, even if it be undistinguished. A plain stone façade, not symmetrical and yet not losing thereby, its merit depends almost wholly upon proportion and massing; in this offering a contrast to its mammoth neighbour, which is an example of symmetry and well-distributed ornament, of which there is a sufficiency without a superabundance. This building—the Junior Constitutional, erected in 1892—is one of the earliest instances of the use of marble as an external facing in London; but such use is not very effective permanently on account of the atmosphere, a periodical cleansing being necessary, in order that the values may be restored. The red granite columns to the windows give some pleasing relief to a building that even in their absence would be still satisfactory. Without much exaggeration it might be said that this building looks more in character than the Senior Club by the same architect; for the Piccadilly house is a decorous, stately edifice, whereas the one in Northumberland Avenue is full of colour and domestic charm, qualities unknown to the "Constitution." The Badminton and Turf Clubs are assuredly inexpressive of their purpose as sporting clubs, but there is no need to overstrain these fancies. In passing it is well to affirm the desirability that an architect should acknowledge his handiwork by having his name inscribed in the same way as it is customary for painters, sculptors, musicians, and authors to acknowledge their identity. Colonel Edis has subscribed to this view in his clubhouses, and here in Piccadilly there are some half-a-dozen other buildings similarly acknowledged.

The Junior Naval and Military Club, designed by Messrs. Thomas & Frank Verity in 1891, is, like the two buildings just described, of the small company of specially designed clubhouses in this thoroughfare; and an uninteresting building it proves to be, not so much for want of material of interest as for want of management of the material; it is not a building near which we would linger. And this, too, is the feeling in regard to the Turf Club (at the corner of Clarges Street), which offers to the view nothing striking except a pair of continuous bow-windows, and these are too striking, being overloaded with decoration. The effect of these windows on the brick façade is one of crude application instead of forming an integral factor; in this respect it contrasts unfavourably with the numerous other frontages in Piccadilly furnished with such windows; for the "bow" is as much a feature of this thoroughfare as it is of St. James's Street, with the important variation that in the street now under review it extends through several storeys, sometimes through all.

The premises erected for the Imperial Colonial Club are as commonplace as they are modern; their virtues are of an entirely negative description, and though there are not perhaps any actual architectural vices, yet were the buildings analysed the destructive process would be unpleasant.

Of the numerous premises devoted to club life in the thoroughfare, though not necessarily erected for the purpose, but few demand notice here. Of these the Naval and Military Club may take precedence. It occupies an eighteenth-century mansion, known during the first half of last century as Cambridge House, when it was first occupied by our present King's great-great uncle, the first Duke of Cambridge, who died here in 1850; and here also died Lord Palmerston in 1865, the year in which George V. was born. The house is one of a type, elsewhere exemplified in Devonshire House, but making a much better appearance than the latter, though the effect of but one advanced wing is curious and not pleasing.

(*To be concluded.*)

Mr. W. Hunter M'Nab, architect, Glasgow, has prepared plans for a block of buildings in Helensburgh, comprising eight shops and fourteen dwelling-houses. The scheme was on Monday passed by the local Dean of Guild Court.

ANCIENT BUILDINGS IN TURKEY.

THE following memorial to the Ottoman Government, which has received influential support, is in course of signature by antiquarians, artists, and others interested in the preservation of memorials of the past. Names may be sent to Mr. Arthur Phillips, 9 Northumberland Avenue, Putney, S.W.

To His Highness the Grand Vizier and Council of Ministers,
Sublime Porte.

Your Highness and Your Excellencies,

Without in any way presuming to interfere with the prerogative of Government, we very earnestly beg to appeal to your Highness and the Council of Ministers for the issue, by His Imperial Majesty the Sultan, of an Iradé commanding that measures shall be taken throughout the Ottoman Empire for the protection and preservation of the ancient walls, buildings, temples, fortresses, and other archæological remains, which are universally recognised as being of the greatest possible value and interest to the artist and architect no less than to the scholar and the historian.

We feel sure that the Government of the Sultan cordially desires to take all possible steps for the adequate safeguarding of these precious monuments of antiquity, and that the Council will not misunderstand our motive in making this appeal. It is because we know the irreparable injury done by carelessness to the priceless memorials of the earlier decades of the last eight centuries that we hasten to petition for the effective protection of the works of past ages which, if destroyed, can never be replaced.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) contains a descriptive article with numerous illustrations of recent work by Mr. Louis Christian Mullgardt carried out within a radius of forty miles of the city of San Francisco, which show that this architect has developed a style of his own, interesting in its originality. Some of the designs for the Paris Prize of the Society of Beaux-Arts Architects show what the best of their students are doing to-day.

Der Architekt (Vienna) is less violently "new art" than usual, and contains rational designs for a museum at Innsbruck by Dr. Karl Holey, a church at Abbazia by Carl Seidl, a villa near Prague by Professor Jan Kotera, and for flats over shops by Herren Hoppe, Kammerer & Schönthal.

Arkitektur og Dekorativ Kunst (Christiania) has a critique on a competition for a garden suburb at Vestre Hasle promoted by the chocolate manufacturing company, "Freia." The lay-out and design for houses submitted in the three premiated designs are illustrated.

Arquitectura (Barcelona) illustrates the designs and work in progress at the new cathedral of Vitoria, of which Don Julian Apraiz & Don Francisco Javier de Luque are the architects. A new church at Huerta de Valdecarabanos, Toledo, by Don Jesus Carrasco, and a design for the restoration of the national Pantheon at Caracas, Venezuela, by Don Alejandro Chataing, are also illustrated.

Construction (Toronto) illustrates a costly house at Montreal by Messrs. E. & W. S. Maxwell, in which various parts of the interior are designed more or less in accordance with various phases of French Renaissance. The internal decoration of several Canadian steamships, from the designs of Messrs. Bond & Smith, forms the subject of an illustrated article.

La Construction Moderne (Paris) illustrates two of the competing façades for the prizes of 1909, a house in the rue Defrenoy by Messrs. Formigé and Gonse, and another in the rue Pergolèse by Mons. Roussi.

Deutsche Bauzeitung (Berlin) gives a full description with illustrations of the buildings erected for the International Health Exhibition at Dresden.

Moderne Bauformen (Stuttgart) illustrates this month a number of designs by Herr Bensel, of Düsseldorf, but for the most part the plates are of miscellaneous character, including country railway stations and American bungalows. There are some well-reproduced colour drawings of interior decoration.

Il Monitore Tecnico (Milan) has an article on the restoration of the abbey of S. Gregorio at Venice.

Stone (New York) includes a good photograph of the fine interior court and staircase of the Palazzo della Universita, Genoa.

The *Western Architect* (Minneapolis) illustrates several examples of Californian architecture, farm buildings in Iowa, a Baptist church at Minneapolis, and a school at St. Louis, Missouri.

Saturday, September 9.

Architectural Association : Camera, Sketch, and Debate Club's Foreign Tour to Caen and District.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.—III.

THURSDAY saw another departure from the original programme, it being decided that it was not worth while spending time in visiting Cormery, with its remains of a Benedictine abbey founded by Charlemagne, and possessing a church of eleventh and twelfth-century date, with a refectory and part of the cloister of thirteenth-century work. The view of the monastic pile from the train was quite sufficient for the excursionists, as was that of the Château of Montbazon, with its rectangular keep of the twelfth century, which in 1866 was crowned with a colossal statue of the Virgin in bronze. Even the Château de Couzières, which from the sixteenth century was the home of the Dukes of Montbazon and was rebuilt in the first half of the seventeenth century, was left on one side to carry out the recommendation of some who had been over the ground before to devote the whole day to Loches.

The decision was a wise one. There is more than enough in Loches to occupy the attention of an architectural student for a whole day, and even as it was only a few of the party made time to visit the abbey church of Beaulieu, built by Foulques Nerra between 1008 and 1012, with a fine steeple and stone spire of the twelfth century and fifteenth-century additions or reconstructions. The abbot's lodging of sixteenth and seventeenth-century date has a curious external pulpit, but most of the abbey buildings were rebuilt in the eighteenth century. Besides the abbey there are some old houses in Beaulieu worth study, amongst them a small sixteenth century one with tourelle, the so-called *Maison d'Agnès Sorel*, and the Château de Sansac.

For once work was possible before the inevitable *déjeuner*, and the necessary formal visits to the Château Royal or Logis du Roi, the church and the *donjons* or keeps, which, with connecting and enclosing walls and towers, formed the great fortress of Loches, were got through with still some time for sketching before midday.

The Château Royal, which was first visited, has been the residence of Charles VII., Louis XI., Charles VIII., and Louis XII., and, as far as the exterior goes, dates from the reigns of the first and last of these sovereigns. In the interior the most interesting part of the château that is shown to visitors is the small mortuary chapel in the highest tower that contains the tomb of Agnès Sorel, with its beautiful recumbent effigy. The oratory of Anne of Bretagne is also a charming work.

The collegiate church of St. Ours, formerly, until after the Revolution, that of Notre-Dame, is one of the most interesting in the Loire district, with its quasi-domical pyramidal roofs over the nave and its two towers. It is curious to find so far north a reflex, if not an imitation, of the plan and roofing of the domical churches of La Charente. The introduction of this form at Loches is credited to Thomas Pactius, who was Prior in 1168. The westernmost bay of the nave, which is surmounted by the western tower, is said to have formed part of the church built by Geoffroy Grise-Gonelle, Count of Anjou, and consecrated in 965. The western doorway of twelfth-century date has a very fine semi-circular arch ornamented with sculptured allegorical subjects, unfortunately much decayed. The excursionists, after viewing the church, which has been, particularly internally, considerably restored, descended to the curious crypt with its ancient mural painting of St. Brice.

Sight-seeing at Loches was concluded with a tour of inspection of the *donjon* or keep, built in the eleventh and twelfth centuries, and supplemented by the *tour Ronde* or *tour Neuve* to serve as the famous or infamous State prison of Louis XI. and his successors. After *déjeuner* nearly four hours were available for sketching, for which there is in Loches a plethora of subjects, including the *porte des Cordeliers*, with its picturesque tourelles and fifteenth-century windows; the *tour Saint-Antoine*, built between 1519 and 1530, and the only remains of a church since demolished; the Hotel de Ville, erected between 1535 and 1543 from the designs of Jean Beaudoin, and adjoining the *porte Picoys* of the fifteenth century, with which it forms a picturesque composition. There are besides numerous smaller buildings of interest and charm, such as the Hôtel Rouillon in the rue Saint-Antoine, a Renaissance house in the Grande-Rue, and several in the rue du Château, notably that known as la Chancellerie, built in the reign of Henri II. Thus a very satisfactory day was spent at Loches and everyone returned tired and happy to Tours.

Friday proved the culmination of the week's programme. The travelling was done by motor-car, a welcome change from the railway journeys of the previous days in the sweltering heat that prevailed throughout the whole excursion. The first halt was made at the Château de Villandry, where a most enjoyable couple of hours was spent, enjoyable not only by reason of the beauty and interest of the house itself, but still more from the charming enthusiasm of its owner, Mons. Carvallo, who met the visitors and showed them round, pointing out the various features of the house and gardens, as he has succeeded in recovering them from the superimposed eighteenth-century top-dressing of the Marquis de Castellane, who in his time modernised the house, built about 1532 by Jean le Breton, Secretary of State to François I. The château encloses three sides of a hollow square, the wings having arcaded loggie on the ground floor, whilst the principal corps de logis has solid walls and windows. In the eighteenth century the arcaded openings were closed up, the windows stripped of their mullions and transomes, and sham windows painted between the real ones. This has now all been amended, and the house shows the admirable design and detail, which is of a very high character, that it received in the time of le Breton. It is worthy of notice that the entrance front of the main corps de logis faces north, so that the arcaded loggie look respectively east and west. South of the house is a fine formal garden, with a canal on one side that is continued as a quasi-moat in front of the house. On the other side is a fine terrace walk and avenue at a high level, overlooking the garden. Much of the old enclosing balustrading of the garden has been destroyed, but Mons. Carvallo is engaged on its restoration. Part of the south front and a square tower at the south-west angle date back to the fifteenth century, and possibly some of the foundations may even belong to the time when Philip Augustus and Richard Cœur de Lion signed a treaty in 1189 at Villandry, or Coulombières, as

" THE ARCHITECT " STUDENTS' SKETCHING AND MEASURING CLUB.

A COTTAGE CHIMNEY AT WESTERHAM, KENT.

From Drawings by "Plato."

it was then known. The interior of the château has been largely refitted in the eighteenth century, and there is some quite admirable work of that period, particularly in connection with the principal staircase, which we understand Mons. Carvallo wisely intends to retain. Before leaving Villandry the party visited the stables, which are an excellent example of eighteenth-century design, and the parish church, of eleventh and twelfth-century date, which is remarkable for the internal pendentive dome of Byzantine type over the chancel and a stained-glass window of 1543, with a portrait of Anne Gedouin and a sketch of part of the château.

From Villandry the excursionists proceeded to Azay-le-Rideau, whose famous château, the most exquisite gem of the Loire Valley, is now a *monument historique* and the property of the State, by whom it was purchased, with the park, in 1905 for £8,000, but without the furniture and art collection that had previously been contained in the house until sold separately. The château is now under the care of the Department of Education and Fine Art and is being utilised as a museum of Renaissance art.

The early history of Azay-le-Rideau is legendary if not mythical. It is said that the first château was built here in 1255 by one Hugues Ridel or Rideau, and it is related that the castle and town were sacked and burnt by Charles VII., when Dauphin, in revenge for an insult offered him by the garrison. The veracious history of the château commences with the erection of the present building about 1518 by Gilles Berthelot, from whom it was confiscated by François I., and afterwards became the residence of Gabrielle d'Estrées.

Small though it is, there is something peculiarly enchanting about the proportion and refinement of Azay-le-Rideau that makes its composition, enhanced as it is by its setting, wonderfully effective and places this château on a higher level of graceful beauty than any other in the Loire Valley. The stables and servants' quarters, erected in the seventeenth century by Henri de

Beringhem, received full attention from the sketchers, although in artistic merit far inferior to the château itself, but the church, an interesting example of eleventh-century work, with additions of the fifteenth, sixteenth, and seventeenth centuries, was neglected.

Leaving Azay-le-Rideau with considerable regret, the excursionists then rode on to Langeais, a small town on the right bank of the Loire, dominated by the feudal castle, erected in the middle of the fifteenth century by Jean Bourré, in an enclosure which contains the ruins of the *donjon* built by Foulques Nerra in 990, and, therefore, the oldest of French castles. The Château of Langeais belongs to the Institut de France, to whom it was bequeathed by Mons. Jacques Siegfried, who had restored and completely furnished the interior with an interesting collection of fifteenth-century furniture and appointments, some original, but mostly copies, French, Italian, Spanish, and Flemish. The visitors were not allowed to sketch within the precincts of the château, but were conducted with rigorously-restricted movements through the interior.

There are some old houses in Langeais, including one in which Rabelais lived, and the church has a fine tower of ninth and twelfth-century date, but the body of the edifice has been lately rebuilt in hideous fashion.

On the way back to Tours a brief stay was made at Luynes, whose finely-situated château is placed on the top of a high hill, approached by a long series of steps that took up a considerable portion of the visitors' time and left but little for viewing the building. Of this there is not much of domestic as distinguished from military architecture, beyond a graceful building in brick and stone erected in 1465, flanked by an octagonal staircase tower. Fine views are obtained from the ramparts, and there is an interesting fifteenth-century chapel in carved timber work in the precincts. The remains of a Roman aqueduct near Langeais did not attract the excursionists, nor was there time to visit the sixteenth-century houses in the little town.

An early start was made on Saturday for Saumur, the train to which city was only caught at the last minute by a bold rush and deferment of payment for the collective ticket of the party. Some time was spent in Saumur, but not sufficient to allow of much sketching after inspection of the town hall and one or two other buildings near the river. The castle was too far off to be visited.

As the steam tram to Montsoreau indicated in the programme did not run at the time stated, horsed vehicles had to be engaged, and hence the journey to Candes occupied more than the allotted time, and the stay there was shortened to ten minutes, all too little for this magnificent unrestored church of Saint-Martin, which, with its lofty nave and aisles vaulted at the same height, partakes of the character of a German hall-church. The principal porch is remarkable for a single central shaft carrying the vaulting, and machicolated battlements give it quite an uncommon appearance. There are some finely sculptured figures to the portals of thirteenth and fourteenth-century date, though many are headless. Internally traces of colour decoration on the figure sculpture suggest that the walls, now bare, were also coloured. No more than a glance could be given at the fifteenth-century gendarmerie at Candes and the château at Montsoreau.

After *déjeuner* at Montsoreau, the members drove on to Fontevrault, the abbey of which is now a prison and, therefore, only visited under surveillance and sketching forbidden. The effigies of Richard I., Henry II. and his queen, and the mother of Henry III. were shown, the cloister, with its François premier work, and the church, now in course of restoration; also the chapter-house, with a collection of fragments from the twelfth century onwards, and an interesting model of the whole abbey. In the town of Fontevrault are one or two picturesque houses, but it was generally felt that a larger part of the day might have been more profitably spent at Candes and Montsoreau than at Fontevrault. The party drove back to Saumur and thence by train returned to Tours.

No organised visits were made to the many buildings of interest in Tours; the cathedral, the bishop's palace, the Hôtel Gouin, the house of Tristan l'Hermite, the tour de l'Horloge, the tour Charlemagne, the new Hôtel de Ville, the Chamber of Commerce, and many old houses and churches had to be visited early in the morning before the time of catching trains.

The programme of the excursion ended on Saturday, August 19, and the next day most of the members journeyed together to Paris, whence half the party returned direct to England viâ Boulogne and Folkestone, others remaining from fear of being unable to get home on account of the railway strike or from a desire to "taper off" with a little further sojourn in France.

NOTES AND COMMENTS.

The present position of the building trade is reflected with accuracy in the annual reports of manufacturing companies dealing with goods used in building. Of these the annual meeting of shareholders of the Leeds Fireclay Company, Ltd., afforded a striking object-lesson. The company during the past year could not quite earn its debenture interest, much less provide a dividend for its shareholders, and the chairman gave some statistics relating to the building trade that tended to explain the slackness of the company's business. He said that during the last few months the demand throughout England for the chief articles which the company produced was such that that company alone could almost have executed the orders. A recent Blue-book showed that whilst in 1900 there were 77,000 bricklayers and labourers in certain unions, in 1909 the 77,000 had come down to 42,000. Although in trades outside the building group there had been an increase in membership in 1910, the decrease in the seventy-one unions in the building trade was 3.5 per cent., following a decrease of 8.2 per cent. in the same trades the previous year. The membership at the end of 1910 was the lowest recorded since comparative statistics were first prepared.

Over-building was not the cause of the present depression in the matured opinion of the directors of the company, who had come to the conclusion that it was not a question of over-building, because depression from this cause never extended over ten years. There was something abnormal about the position, and the directors felt that it was not only the pin pricks of legislation in regard to the property market, but it was the fear of what those pin pricks were going to lead to later on. They had nothing to do with it themselves except to suffer just as all shareholders in similar companies were suffering.

Legislative burdens pressed heavily upon manufacturers, and threatened to do so even more severely in the near future. Workmen's compensation was growing at an enormous rate, and for the present year they would be paying £2,000 in that direction. If the Insurance Bill passed in its present form, or anything like it, the result would be a further increase of 25 per cent. on the charges mentioned. That was a serious charge upon a company and a trade which was being injured and hurt by legislation in other directions. They had entered a strong protest against such a proposal without consultation with large employers of labour, and they had asked Mr. Lloyd George pointedly how it was possible in a trade which was only employing half its plant, with all its workmen on short time, and no possibility of increasing prices, to find the £2,000 a year which the Act would impose upon them? Shareholders had many facilities for making their influence felt, and it would be a great mistake if they did not do everything possible to stop the Bill. As drafted it was a bad Bill, and in their own trade was not calculated on a proper basis. Its provisions in regard to unemployment in the building trade were ludicrously inadequate. Another fact frequently lost sight of was that in cities such as Leeds, where the Corporation were large employers of labour, the cost of insurance would mean the addition of a penny or even 1½*d.* in the pound on the rates.

The British Archæological Association and the London and Middlesex Archæological Society have joined hands in promoting a congress which will be held from September 25 to September 30, to afford, as far as possible, a chronological survey of London and its antiquities. Each day will be devoted to the study of a particular age in the history of the city and county, and after an opening address visits will be paid to such parts of London as illustrate the period under consideration. Thus, the prehistoric, Roman, and Early Norman period will involve the study of the antiquities in the Guildhall Museum, the remains of the London wall, the Roman bath in Strand Lane, and the Tower. Norman and mediæval London will include such places as St. Bartholomew's, Smithfield, the crypt of Bow Church, St. Olave's, where Pepys worshipped, the Charterhouse, and Southwark Cathedral. Tudor and Stuart London will be represented by the Inns of Court and the Savoy Chapel Royal; and Stuart and Georgian London by a few of Wren's most famous churches, the halls of the livery companies, and the Mansion House. The arrangements are in the hands of Mr. Allen S. Walker, and the presidents of the congress will be Mr. Charles E. Keyser and Sir Edward Brabrook. It is proposed that the presidential address shall be delivered after a luncheon held at the Fifth Avenue Hotel on September 25.

Mr. F. W. Lippmann writes to the *Times* calling the attention of English art lovers who are at present travelling on the Continent to the excellent little exhibition of works of art of the tenth to the eighteenth century which is held at present at the Landes Museum at Stuttgart. The management of the museum has brought together, mainly from churches at Würtemberg, a remarkable collection of Church plate, clerical vestments, and wood carvings. The silversmiths' work includes the wonderful gold and enamelled antependium from Gross-Camburg, which dates back to the early tenth century, and is similar to but rather richer and finer in preservation than the piece in the Musée Cluny, which came from the treasury of Basle Cathedral. This object has not been exhibited for many years. Perhaps more important still is a wooden tenth century lectern composed of the four Apostles (full figures), with their emblems, upholding the desk. This wonderful object, which stands four feet high, is in perfect preservation, and still shows the original colouring. Many of the other objects are excellent and certainly deserve a visit. The exhibition closes in October.

THE BRITISH MUSEUM.

According to the "return" of the British Museum, issued last week, the total number of visitors to the Bloomsbury and Natural History Museums in 1910 was 739,837, a good increase over the total in 1909 (708,836), though not quite equal to that of 1908 (743,413), which was the year of the Franco-British Exhibition. The total for weekdays was 670,104 (the highest figure since 1905), and for Sundays 69,733 (the highest on record with the exception of 1908). The number of visits by readers to the reading room was 219,274, an increase of 1,300 on the previous year, and the third highest in the records of the museum. The daily average was 726. The visits of students to other departments of the museum show a decrease of about 500. Visits to the sculpture galleries showed a large increase, while visits to the departments of manuscripts and Oriental printed books and manuscripts showed decreases, and those to the department of prints and drawings were identical with the figure for the previous year.

The return mentions that work was in progress throughout the year on the British Museum extension building, that the main external structure of the building was almost completed, and that plans for the internal furniture and fittings were prepared. Another section of the reconstruction of the roof with fire-resisting partitions was taken in hand, and the usual work of renovation and repair was carried out.

In the department of Egyptian and Assyrian antiquities the most noteworthy addition during 1910 was a handsome roll of papyrus about 122 feet long by 1 foot 8½ inches wide, presented by Mrs. Greenfield. It is inscribed with a series of spells, prayers, hymns, &c., in the hieratic character, which form the chapters of the great funerary work of the Egyptians called "Per-em-hru," or the "Book of Coming Forth by Day," now generally known as the "Book of the Dead." It is illustrated with pen and ink vignettes of great delicacy and spirit.

This papyrus was made for Princess Nestanebasher, the daughter of a high priest king at Thebes, about B.C. 980, and was buried with her in her tomb. During the troubles which came upon Thebes soon after her death, her mummy, her papyrus, and all her funerary furniture were removed with the mummies of the kings and queens to a tomb at Der al-Bahari, where they remained hidden until discovered by the natives some time before 1870.

The roll includes several new texts, and is of unique interest for the sidelight it throws on the religion of the period. One of the most important purchases for this department was a fine foundation deposit brick in blue glazed porcelain from the temple of Rameses II. at Bubastis, XIXth dynasty. On each side are the royal names and prenomens of Rameses II., King of Egypt, B.C. 1330, and round the sides run the king's titles or "strong names." This is the largest and finest brick of the kind hitherto discovered. There is also a small brick from the same deposit and place inscribed with a text which states that the temple was built for Rameses II. by one of his sons, called Kha-em-Uast, the famous magician, whose statue is already in the museum. Another purchase was a massive stone sarcophagus of Qem-Ptah, a man of very high rank, who filled several offices, both ecclesiastical and civil, at Memphis, and flourished about the middle of the Ptolemaïc period, B.C. 200. The cover is inscribed with a series of religious texts and prayers based on certain chapters of the Book of the Dead. The inside of the sarcophagus is decorated with figures of all the gods which were regarded as gods of the dead at that period, and with figures of several of the Thirty-Six (or Thirty-Nine) Dekans. These are arranged in panels, and by the side of each god is a short text which explains his duties in connection with the dead. The whole of the outside is occupied with the scenes and texts of the famous Guide to the Other World, which the Egyptians called "Am-Tuat." This book is based upon ancient works, such as the "Book of the Two Ways," and contains ideas and beliefs which are as old as the earliest dynasties. According to these the Other World was divided into ten portions. At each end of the group was a vestibule, which communicated directly with this world. The book "Am-Tuat" was intended to make the spirits of the dead acquainted with the various regions through which they had to pass, and to supply them with pictures of the beings which dwelt in them, and generally to guide them to the Fields of Peace. It taught that the righteous were rewarded by Osiris, and that the wicked were slaughtered by his executioner Shesmu, who hacked their bodies in pieces and cast them into pits of fire.

Apart from any acquisitions to the department of Greek and Roman antiquities, the past year has seen the end of an important re-arrangement in the Sculpture Galleries. The remounting of the central group from the west pediment of the Parthenon, designed and begun last year, has been completed by Mr. A. H. Smith. The torsos have been raised to their proper heights, in relation to the base line, on shafts of Istrian marble, the poses of the fragments have been re-studied and corrected, and the figures are set on pivots so that they can be turned about their vertical axes. The figure hitherto known as Victory has been transferred from the east pediment to its original place in this group. A colossal head of Athena, which is thought to represent a Pheidian type, has been moved from the Græco-Roman gallery to a place in the Elgin room. It may also be mentioned that the publication of "The Sculptures of the Parthenon," by Mr. A. H. Smith, consisting of collotype and photogravure plates and text in folio, was completed. It is sold at £5 15*s*. There have not been any sensational additions. The best is a fine stone and marble relief of the fourth century B.C. from Attica, the principal female figure being in unusually good preservation.

The department of British and Mediæval Antiquities has benefited, as usual, by the generosity of a large number of private donors, in some instances through the valuable agency of the National Art-Collections Fund. Among the antiquities specially mentioned are a number of objects of Gothic workmanship from the Crimea and the Balkan Peninsula; early maiolica from Orvieto; several articles obtained by the British and Chinese troops in Tibet; Chinese pottery; and a set of jade tablets from the Temple of Ancestors at Pekin.

In the department of Coins and Medals considerable additions have been made to the collection of Macedonian coins, with a view to a catalogue, now in course of preparation. In all, 1,548 coins and medals were acquired by the department in the course of the year, of which 499 were received by gift. Sixty-five coins, some of great rarity, were derived from a hoard found in Hampshire, dating from the middle of the second century. Another interesting group consisted of coins struck during the revolt of Judea in the reign of Hadrian. Among the English coins acquired were a Bristol halfpenny of Henry VI. and a quarter-angel of James I., both believed to be unique.

The department of Prints and Drawings was exceptionally fortunate in the generosity of benefactors during the year. The bequest of Mr. George Salting included works, many of them of the highest importance, by Dürer, Holbein, Canale, Rembrandt, and other Dutch masters, François Clouet and his school, Gainsborough, Turner, Constable, and De Wint. The Wegener collection of 147 Chinese paintings, acquired largely by the subscriptions of friends, gave the museum a series of admirable specimens of Eastern art, which it would be hard to match out of China. Eleven highly finished drawings by D. G. Rossetti were presented, and the National Art-Collections Fund (among other benefactions) secured for the museum six fine designs for ceramic and goldsmith's ware by Alfred Stevens. Under present conditions of prices of works of art, it is only through such liberality of private benefactors that the British Museum can hope to maintain its position in the first rank of existing collections. The most important purchase during the year (apart from the part-purchase of the Wegener collection) was that of a large number of etchings by the late Sir F. Seymour Haden, P.R.E., which had been specially brought together by the artist and destined for the British Museum.

Two hundred and thirty-two platinotype photographs of ancient or interesting buildings and monuments in various parts of the United Kingdom, in continuation of the National Survey and Record, were presented by the Secretary on behalf of the contributors to the Survey and Record.

The department of Manuscripts acquired a considerable number of historical papers (chiefly from the sale of a further instalment of the Phillipps Library). The most important acquisition of this kind was the original autograph Trafalgar memorandum, written by Lord Nelson on October 9, 1805, to explain the tactics which he intended to adopt on meeting the allied fleets of France and Spain; this, having been bought for a large sum by Mr. B. M. Woollan, of Tunbridge Wells, in 1905, passed (in accordance with an agreement made by him with the trustees) into the possession of the nation as a free gift on his death in December 1909. Other valuable gifts were the original diary of George Romney, recording sittings for portraits, 1776-1795, which was presented by Mr. T. Humphry Ward, and the original MS. of a portion of John Ruskin's "Laws of Fésole."

In the department of Printed Books the principal purchases have been in the category of Incunabula (books printed before the close of the year 1500), in order that the catalogue of Early Printed Books in course of preparation might be as complete as possible. Fifty-nine books printed in the fifteenth century, and eighty-five books printed before 1640 were acquired. Among the donations are "Photographs of Palace Buildings of Peking, compiled by the Imperial Museum of Tokyo. Collotyped from the negatives by K. Ogawa. With explanatory notes in Japanese, English and Chinese"; and "Decorations of Palace Buildings of Peking. With eighty plates." Tokyo, 1906.

THE DESTRUCTION OF CEMENT AND CONCRETE.

(Contributed.)

(Concluded from last week.)

We now come to the experiments made by Professor White in the laboratories of the University of Michigan. As it is probable that the majority of the readers of this journal are more interested in the quantitative results than in the methods employed, those who wish to study the details of the work may refer to the Proceedings mentioned.

The linear shrinkage of bars of neat cement, kept constantly in the air, is given below. Four different brands of commercial cement, all passing standard specifications for constancy of volume, were used. The volume of the bars varied with the humidity of the air, but on the whole the shrinkage of all the bars was reasonably uniform. In all cases an average is of six tests, except for the two years' test, which is an average of five, and the one and four years' tests, which are averages of three.

Test on Neat Cement.

Time in Air	Shrinkage of Cement %
7 days	−0·109
28 days	−0·190
6 months	−0·236
1 year	−0·270
2 years	−0·289
4 years	−0·322

Thus Professor White has shown that one-third of the shrinkage takes place in the first week, more than half of it in the first month, and almost all of it in the first year. He reminds us that a shrinkage of 0.322 per cent. amounts to nearly 4 inches on 100 feet, and shows clearly why it is not possible to use neat cement on interior floors and wall finishes.

Neat Cement alternately Wet and Dry.

From numerous results we may take the following important conclusion: "From the standpoint of structural stability it is rather disquieting to learn that these cements which had remained in water without any measurable change in volume from their first to their third year shrank 1.7 inches on 100 feet when they were dried in air, and in twenty-four hours when again brought in contact with water, expanded 1.5 inches, and within a month had expanded 1.8 inches, calculated on an initial 100-feet measurement."

Changes, on a somewhat smaller scale, but similar, took place in the length of bars of Portland cement mortar, mixed in the proportion of one part by weight cement to three of sand. In four of the middle bars one of the best known commercial waterproofing compounds was incorporated, according to the manufacturer's directions. There was no real difference in the behaviour of these bars and those not waterproofed. Various comparisons were also made between bars of neat cement and those made with sand under identical conditions, but the results are too lengthy to be included here.

Practical Results.

As it was thought possible that it might be urged that all of the tests were made on small bars manufactured under College conditions, Professor White used a part of the cement sidewalk of the University of Michigan, which had been down for twenty years. He also tested a piece of cement stucco which came loose from a brick porch after only two years' service. He found that the variations in volume with change of moisture content did not disappear with lapse of years, for changes of 0.05 and 0.06 per cent. have been observed in bars cut from sidewalks which have been laid down for twenty years.

Although the above changes may seem small, let us see what they mean in practice. A wall of neat Portland cement 100 feet long is anchored at each end to immovable supports. Let it be under water for three years. At the end of that time it would, if free, have expanded 1.2 inches. Since it cannot move, the compression stress will be 0.1 per cent., which, assuming a modulus of elasticity of 5,000,000 lb., means 5,000 lb. per square inch. Perhaps the cement could withstand that pressure.

Suppose now that the cement becomes dry. It should contract 1.7 inches, but since it is not free to move there will be developed a tension stress of 7,500 lb. per square inch. This is several times more than that which the material can stand. *The wall will crack.*

If the neat cement wall had been originally allowed to harden in the open air, it would, if free, have contracted 0.25 per cent. Since it was anchored there would be a tensile stress of 12,000 lb. per square inch. It is, therefore, obvious why neat cement is not used in practice.

While we have no experimental data *re* the changes of volume of leaner concrete, it is not conceivable that gravels and sands which have withstood the action of the weather for centuries without disintegration can change in volume much when wet and dried. It is known, however, that even the best steel will not stand, indefinitely, alternate tension and compression stresses when the stress is near the elastic limit of the material.

The Case of Stucco.

Examples are known where stucco has remained perfect after an exposure of half a century to the weather. There are many instances, according to Professor White, where stucco has failed miserably after five years. It has been suggested that the old stucco was made with natural rock cement, but the one test on natural rock cement shows a greater volume change than the tests on Portland cement. It is more probable that the old stucco has survived because of the lower proportion of cement. When the metal lath was introduced to support the stucco there was a coincident drop in the price of Portland cement, and richer stuccos became common. This was unfortunate. A volume change of an inch on 100 feet must cause cracks. They may be only hair cracks, say at every foot, but the protection against corrosion, which the stucco is supposed to provide, disappears. A leaner stucco means freedom from cracks.

Professor White discusses at some length the case of interior floors and explains why it is that shrinkage cracks appear, and the individual slabs curl up at the edges in the effort to relieve the shrinkage strains.

Sidewalks and Pavements.

The influence of temperature upon these is well known, but the chief factor which affects their behaviour is the weather. The experiments in the University of Michigan suggest that a $\frac{1}{4}$-inch expansion joint is required every 10 feet. This allows for change due to temperature and the moisture. The whole subject of the effect of time and weather upon these materials seems to require much closer scientific investigation than has yet been given to them.

From the data already presented it is evident that concrete undergoes a shrinkage as it dries. The conditions are not changed if there is steel reinforcement, provided that the ends are absolutely rigid. If the ends of the beam yield at all, and the concrete adheres to the steel, the strains will be adjusted between the two. The steel will be in compression and the concrete in tension, but to a lesser extent. There is required, however, more information concerning the values of the stresses, and Professor White says, "There is every probability that there are important stresses in all reinforced concrete work due to volume changes in the concrete of which the designers have had no knowledge. These stresses may have been to blame for some of the collapses which have occurred in reinforced work, and the smaller number of such collapses may be more a tribute to the value of the factor of safety than to scientific knowledge."

General Conclusions.

The following are the general conclusions on the whole subject arrived at by Professor White:—

1. Concrete hardening in a moist place and remaining continually moist throughout its life expands slightly, but the compression stress developed is not likely to be injurious.

2. Concrete hardening in air, and remaining continuously dry, contracts. This causes a tension stress, which is harmful. It introduces an error of unknown magnitude into the calculations of all reinforced beams. It is responsible for the cracks in top coat of interior cement floors. Fortunately most of the bad effects are evident within three months.

3. Cement sidewalks, pavements, and stuccos exposed to the weather contract when dry and expand when wet. The richer the mixture in cement the greater the volume change. There is a differential expansion between the top coat and base of sidewalks which is often sufficient to split the two apart. So also rich stucco may be split from brick. In damp climates irregular expansion occurs apparently for as long as twenty years.

4. Rich stuccos will inevitably crack through expansion and contraction, and may easily be ruined. The few experiments made indicate that integral waterproofing compounds do not prevent or lessen the changes in volume. The only safety seems to be in using a lean mixture whose volume change is slight. Also a stucco coat is inadequate protection for a metal lath. If rich enough to keep water out it will crack. If lean enough to avoid cracks water will go through it freely.

From the above it will be fairly obvious that there is ample room for more research work, which will provide quantitative results upon which calculations may be based. There is no doubt that a complete study of the behaviour of cements and concretes under working conditions is needed.

Mr. A. V. Rowe, architect, Worcester, has prepared plans for a Council school at Redditch for 760 children. The cost is estimated at £6,452, or nearly £8 11*s*. per place. The design has been accepted by the Worcestershire Education Committee.

MUNICIPAL ENGINEERING AS A PROFESSION.*

There no longer exists the need to drive home the fact that municipal engineering is a distinct profession. There was a time when the statement would have been met with a shrug of the shoulder or a curl of the lip. To-day no dispute is possible. The profession is recognised universally, and its separate existence is proved in that the Legislature is the one notable exception that has not yet awakened to the fact that this very lusty infant is among us and is making vigorous outcry for its rights. The pedigree of this interesting infant is lost in obscurity. Road foremen, inspectors of nuisances, village grocers, ex-policemen, drapers and civil engineers of the old school are among its progenitors, and it is possible that each of these crossings has had its healthy influence upon the matured product.

I am not going to weary you with any of the claptrap which is talked about the nobility of the profession. Paragraphs on this read well as the peroration to a presidential address, but they mean nothing. Every useful profession honestly practised is as noble as any other, and, after all, men do not usually enter professions simply because they are noble. A means of livelihood is the first need, and opportunity finds it for us. There is certainly no profession in which the possibilities of doing good to one's fellows are so great as that of municipal engineering, but it can scarcely be claimed that the engineer had that fact in view when he competed for his appointment. The inspector of nuisances stands in the same position, and the soft sawder of the professional sanitarian is obvious. To speak of the inspector as a hero who girds on his armour and goes forth to fight the battle in the high cause of humanity is, again, just merely clap-trap. I have met inspectors whose ideals were not quite so high as this.

The Sanitary Officer.

While speaking of the sanitary inspector, a few words on his behalf may be said. There are, of course, inspectors whose sole work is to carry out the orders of the medical officer of health. They are a kind of sanitary police, in whom the organ of smell is popularly supposed to be abnormally developed. They call on cases of infectious disease, and may possibly convey the various complaints wholesale about the district—precisely as the doctor may do. No precautions are taken, and the inspector goes cheerfully from small-pox to diphtheria, from diphtheria to scarlet fever, and so on, calling by the way for refreshment and physical sustenance. His lengthy journeys in rural districts compel this, and I am finding no fault with him. His other duties are to investigate complaints and to furnish his medical officer of health with sufficient detail to make a formidable report to be prepared and signed by the latter gentleman. There is, however, another class of inspector whose duties include the planning and supervising of engineering works. He is mostly known as a sanitary engineer, although no such appointment is officially recognised. The word "sanitary" is, however, damning, and he is regarded as quite inferior to that official whose whole duties may consist of the maintenance and repair of macadam and gravel or flint highways. The matter is one well worth the consideration of the profession in general, and the hand of fellowship should not be refused simply because of the restricted definition of a word which really embraces very much.

The Consulting Engineer.

Municipal engineering is a profession which will some day be found to have usurped the whole field of engineering, except that form known as government engineering. The consultant will, I am afraid, have a very bad time; but the inevitable has to be faced. As matters are now, the municipal man is not encouraged to prepare schemes of any magnitude, and many who are really capable—there are, of course, quite as many (if not more) who are not capable—conceal their knowledge. There is always trouble about payment where the salaried officer is concerned, and when a fee is arranged it is usually only a proportion of that which the consultant would be paid. Honorariums are merely a means to an end—the end being the payment of an amount equal to about one-tenth of that which is morally due. To come back to my point, however. In every direction now municipal trading is being extended. Municipal schemes to run means more responsibility for the officer, and the necessity for a better class of officer—a more highly-trained and more intelligent man. This, again, means higher salary, larger staff, and better accommodation, together with the less frequent requisitioning of the consultant. It may be urged that never was the consultant so in evidence as during the last few years. It is quite true, but it has to be remembered that he is largely engaged in installing first schemes. Extension will not, in scores of cases, go to him; for the necessity for a highly-trained man to run a concern does away with the necessity for another highly-trained man to repeat, to improve or to extend what has already been done.

---

* A Paper read by Mr. B. Wyand at a Western district meeting of the Institution of Municipal Engineers held at Worcester.

"Improving the Status."

There has been much talk of late about improving the status of the profession. The term is a misleading one. What is wanted is to improve the status of the members of the profession, and every man who realises that he is an adviser, and not a servant, is working on right lines. Municipal engineers must realise their own importance. I do not mean that they should cultivate deep voices and contort themselves into ponderous attitudes. I mean only that they must feel their responsibilities, and recognise the fact that supremacy is their place in local life. Even the chairman of the council is merely a cypher when contrasted with the municipal engineer, and he should, as far as possible, be made to feel this. The chairman may be the better man in many ways; but when it comes to engineering he should be made to recognise the fact that he must play fourth fiddle and must feel happy that he has not been relegated to the orchestral triangle. A man is estimated in this world much at the value he places upon himself, and the humble, shrinking individual who is led by his council is never likely to command either respect or a periodical increase of salary. The blatant gentleman who boasts freely is much more likely to succeed for a time; but his day is not usually a long one, and he is the last man to make capital out of a reverse of fortune.

Security of Tenure.

I will say nothing harsher of councillors than that they are entirely unnecessary, and I am sadly afraid that security of tenure will be difficult of attainment so long as district councils exist. It is not to be expected—it would be foreign to human nature—that councillors would welcome the continued services of a man with whom they had quarrelled and of whose services they had endeavoured to rid themselves. The life of the officer would be a miniature hell; indeed, things would be made so unpleasant for him that he would welcome resignation. There is a popular fiction current to the effect that the sanitary inspector is protected by the Local Government Board. He has no more real protection than the surveyor, and councillors may do as they please with him. The sole duty of the council should be the making of the rate, and this could be as well done by one man as by twenty—the collector could, in fact, do it. Directly a council concerns itself on engineering matters it becomes ridiculous, and the effect of its interference is to hamper the technical officers. These should be appointed by a central controlling authority, and should be removable only for misconduct, or at an age when a pension (and a sufficient one) falls due. Their appointment would, in fact, be a life one, with promotion to larger appointments as vacancies occur. They would be responsible to the central department only, just as are police and post office officials. What would happen were these classes appointed and dismissed at the pleasure of small local bodies? Perhaps, when councils no longer exist, the municipal engineer will be appreciated at his true worth. Until then but little can, I fear, be done.

Salaries.

The question of salaries is all-important. Municipal engineers are usually wofully underpaid and overworked. Higher salaries and less hours of labour would reduce the ranks of the unemployed, and the overcrowding question would not recur for years. There would be room for thousands if proper and sufficient staffs were engaged. £150 a year should be the minimum salary for even a deputy or chief assistant.

Qualifications.

The full qualifications for a municipal engineering appointment are so many and so varied that no one man could satisfy a standard. The *essential* qualifications would place no light tax on a man's abilities, and none should be appointed without these. Some towns have, I believe, passed resolutions to the effect that no man should be appointed who has not passed the examination of the Institution of Civil Engineers qualifying for at least associate membership. This is, of course, pure nonsense; indeed, so far as municipal engineering goes, the examination is three-fourths sheer waste of time. While there are special examinations for municipal engineers, it is as ridiculous to ask a man to pass another as it would be to ask a judge to pass in surgery because he might on some occasion have to hear an action in which a broken leg was introduced. That some limitation should be imposed upon the appointment of quite unqualified men no one will deny, but it is equally important that the test to be undergone shall be a reasonable one. It is to be hoped that councillors will not allow themselves longer or to any further extent to be hoodwinked by men whose interest is with an alien profession. It must not be forgotten either—and I cannot lay too great a stress upon it—that civil engineering as practised is only one branch of municipal engineering. A calculating boy or similar wonder need not necessarily make a good municipal engineer.

I have no hesitation, in conclusion, in placing municipal engineering at the top of all the professions. It is one in which the duffer can never shine, and there is no other profession of which this can be said, except perhaps that of the barrister, and he, unless possessed of special talent, has no chance unless he be promoted to the bench. The time has arrived when the municipal engineer must take the place which is his by right, and with two active bodies to voice his interests, both working now upon similar lines, great strides must inevitably be made during the next decade or two.

PETROL AIR GAS.*

During the last few years the problem of lighting places in the country outside the radius of the gas or electric light supply has received considerable attention from inventors. The increased facilities for obtaining petrol, due to the growing demand for this fuel for motor cars, has led experimenters to investigate its possibilities as a medium for producing gas for lighting places which have no central source of illumination.

The idea of supplying carburetted air for lighting purposes is nearly a century old, but was of no value from a practical point of view until the introduction of the incandescent mantle made it possible to use a gas which was comparatively weak in hydrocarbon and had no particular lighting value *per se*. The failure of the old machines was due to the exceedingly high cost of the light when obtained from a luminous flame (necessitating as it does the use of a gas very rich in hydrocarbon), and also to the fact that a gas so rich in vapour could not hold its vapour at temperatures as low as those often met with in practice, with the result that the petrol was deposited in the pipes and lost substantially in illuminating power. But the introduction of the incandescent mantle allowed the use of a gas which had no pretensions to illuminating power, but was a gas whose sole function was to supply the highest possible temperature at the point of combustion. In fact, a gas so low in petrol vapour as 1½ per cent. can be used, whereas the old flat-flame system demanded a gas containing about 12 per cent. to be of any use. The best proportions of vapour to air the author considers to be between 6 and 10 per cent., the reason for which he will endeavour to show.

To arrive at any conclusion as to the best mixture to employ one must consider, side by side with the laws of evaporation and the physical properties of the hydrocarbon used, the conditions the gas must fulfil in actual practice. The main feature of the gas must be its inability to deposit petrol in the system at any temperature it may meet with in the service on its way to the burners, and the next consideration, the author considers, should be the impossibility of combustion of the gas in the system itself, *i.e.*, one should if possible deliver a gas which insures that even if the gauze of a burner perish or a flame in any way be carried back into the service, explosion of the apparatus would be impossible. The following considerations are essential in examining the proportions which fulfil these conditions.

Petrol consists in the main of the lighter hydrocarbons of the paraffin series having the formula $CnH2n + 2$; in fact, the petrol used for lighting purposes consists almost exclusively of pentane (C_5H_{12}), hexane (C_6H_{14}), heptane (C_7H_{16}), and traces of octane (C_8H_{18}), in varying proportions according to the specific gravity and source of the fuel. For instance, from an analysis given by the Anglo-American Oil Co. their

---

* A Paper read by E. Scott-Snell, Associate Member of Council before the Society of Engineers.

"Anglo-Special Spirit for Gas Making," sp. gr. 0·680, upon fractional distillation comes over as follows:—

Probable Composition Judging from Boiling Points.

1 per cent.	at 50 deg. C.	Pentane and Hexane.
27 "	" 60 " "	
28 "	" 70 " "	Hexane.
19 "	" 80 " "	Hexane and Heptane.
12 "	" 90 " "	
6 "	" 100 " "	Heptane.
3·5 "	" 106 " "	Heptane and Octane.

As the highest efficiency is given by a mantle when raised to incandescence by a gas which gives the highest possible temperature at the point of combustion, and this is synonymous with the mixture giving complete combustion, it is easy to find this mixture from theoretical considerations. Taking hexane, which is the most important constituent of the petrol used for lighting purposes, the equation of complete combustion is as follows:—

$$2\ C_6H_{14} + 19\ O_2 = 12\ CO_2 + 14\ H_2O$$

from which we gather that

2 vols. of vapour require 19 vols. of oxygen
contained in (19 × 4·81 =) 91·3 vols. air

$$\therefore\ 100 \text{ vols. mixture contain } \frac{200}{92{\cdot}3} = 2{\cdot}17 \text{ per cent. of vapour.}$$

Similar calculations give as the mixtures for complete combustion:—

Pentane	sp. gr. 0·626	2·53	per cent. by volume.
Hexane	" " 0·663	2·17	" "
Heptane	" " 0·688	1·86	" "
Octane	" " 0·719	1·64	" "

Anyone acquainted with the theoretical aspect of internal combustion engines knows that the greatest explosive effort is given with substantially this mixture of air and vapour. In practice slightly more air is used to ensure complete combustion. The undesirability, then, of supplying this gas direct through the pipes is obvious, although it is exactly the mixture required at the mantle. Practically all plants used for making this gas employ a gasometer to store a certain amount of it, either for direct use or for governing the apparatus relatively to the demand, and if fired by accident this is likely to "give furiously to think." The author has seen the results of an explosion of this kind which were, to say the least of it, impressive.

Experiment shows, however, that the upper limit of combustibility (without the addition of further air) is reached when the amount of petrol vapour in the mixture is 6 per cent. or over (Redwood puts it at 5 per cent, Sorel at 4 per cent.), and it is impossible to fire such a mixture in the pipes and gasholder. In fact, it behaves in exactly the same way as coal gas, and is absolutely safe from the danger of explosion in the system itself.

Evidently, then, to be safe we must use a mixture of not less than 6 per cent. and dilute it to the desired proportions for complete combustion at the burner head by a burner of the Bunsen type. We are immediately brought to the question of how much richer than 6 per cent. we may allow our gas to be. This is governed by the necessity of fulfilment of the first of our essential conditions, viz., that the gas must not deposit petrol in the pipes under any conditions of temperature likely to be met with in an installation. If we find what is the richest mixture stable under these conditions we shall have all our factors satisfied if we strike a balance between this and the upper combustible limit, thus giving a margin either way.

As the gas is usually generated in an outhouse, and may have to traverse a section of piping exposed to frost, one ought to employ a gas stable at some degrees below freezing-point, *i.e.*, a gas which does not become "saturated" until a fairly low temperature is reached. In dealing with this point the author proposes to set out the laws of evaporation at some length, excusing himself on the ground that the matter is only dealt with in the more advanced text-books, and then only in reference to hygrometry and in such a way as to make it very difficult to grasp for a person approaching the subject for the first time. In the author's opinion, there is room for a more simple exposition applied to the case in point. The theory is based upon Dalton's classic experiments on mixtures of gas and vapour. The conclusions he came to (which have been found correct except in special circumstances) were:—

(1) That in a space which contains a liquid and its vapour the liquid will evaporate only until the pressure of its vapour attains a definite value dependent upon temperature only.

(2) That in a space containing dry air or other gas or gases a liquid will continue to evaporate until the pressure exerted by its vapour alone is the same as if no air or other gas were present.

(3) That in any mixture the total pressure is equal to the sum of the pressures that each constituent would exert if it occupied the space alone.

The last two laws are only true in the case where the liquids are not mutually soluble. When the liquids are completely miscible, as, for instance, the various constituents of commercial petrol, the sum of the vapour pressures will be less than the sum of the separate vapour pressures, but its value is more easy to determine by direct experiment than to predict from theoretical considerations alone.

The foregoing, however, does not affect the following reasoning:—

Suppose we have 100 cubic metres of air and vapour at 760 m/m pressure and t° C., of which x cubic feet is vapour. The latter *will behave as if* it occupied the whole space alone, *i.e.*, as if it had a pressure due to expanding from x cubic metres at 760 m/m and t° C. to 100 cubic metres at t° C. This pressure would therefore be

$$760 \times \frac{x}{100}$$

If we know the vapour pressure p at the temperature t° C. (as we often do from vapour-pressure determinations) we have

$$p = 760 \times \frac{x}{100}\ .$$

from which we get

$$x = 100 \times \frac{p}{760}\ \ldots\ldots\ldots\ (1)$$

It follows from the first law that such a mixture is not on the point of condensing part of its vapour unless p is the pressure of the saturated vapour corresponding to that particular temperature. Hence the condition of stability, or otherwise, is known if we know the pressure of the vapour in the mixture and the saturation temperature corresponding to this pressure.

(To be continued.)

ILLUSTRATIONS.

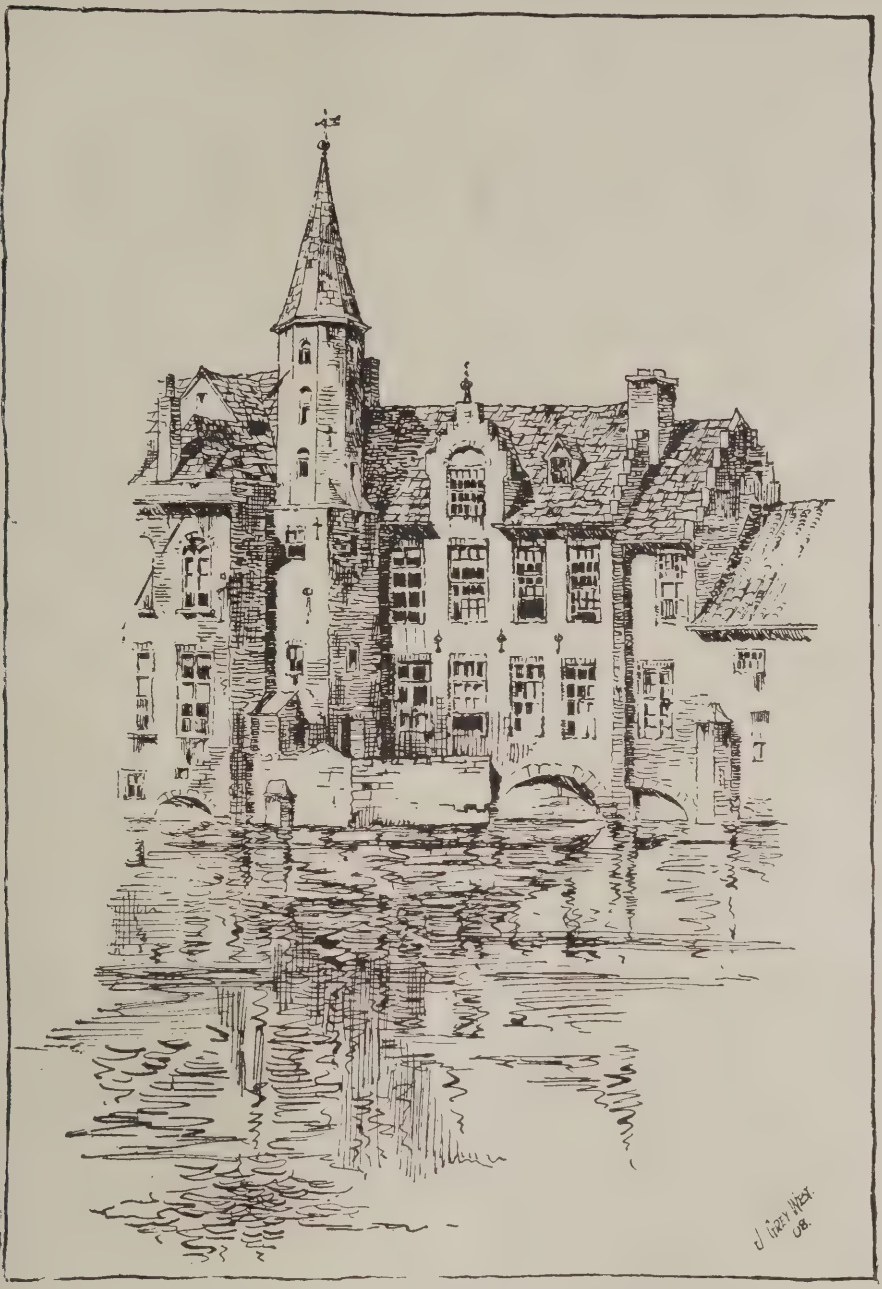
ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

We give this week further illustrations of the château at Chenonceau from photographs taken during the visit of the Architectural Association.

CHURCH OF SS. MARY AND CHAD, LONGTON, STAFFS.

The eastern portion of this church was built in 1897 from the designs of the late Mr. J. Martin Brooks. The western portion, which was dedicated by the Bishop of Lichfield on November 5, 1910, was designed by Mr. J. Standen Adkins, of the firm of Jas. Brooks, Son & Adkins, the contractors being Messrs. Tompkinson & Bettelley, of Longton. In order to meet present requirements the west end, with the porches and baptistery, had to be entirely re-designed, but the new part of nave and aisles continued the form of the existing bays. The statues of SS. Mary and Chad, in the tympana of the porch doors, are the work of Mr. J. E. Taylerson. The marble font is by Messrs. J. Whitehead & Sons. The stone pulpit is by Messrs. H. H. Martyn & Co. The baptistery windows are by Messrs. Campbell & Christmas, who have also painted the first two of the series of Stations of the Cross. Two new windows executed by Mr. N. H. J. Westlake have been placed in the aisle in continuation of a series by the same artist commenced in the eastern bays.

The Governors of the Glasgow School of Art have appointed Mr. R. Anning Bell, R.W.S., as Professor of Design and Decorative Art, with charge of this important section of school work. Mr. Anning Bell is a leading member and exhibitor of the Arts and Crafts Exhibition Society, and an active participant in the Art Workers' Guild. He has for many years acted as examiner in the national competition among schools of art organised annually by the Board of Education. For the past six years he has had experience of the Scottish Schools of Art, first as visitor and latterly as assessor, acting for the Scotch Education Department in the award of diplomas. His work as a painter, modeller, designer of stained glass and other decorative work, and as an illustrator of books, will be familiar to our readers.



AT BRUGES.—From a Sketch by Mr. J. GREY WEST.

HE ARCHITECTURE OF LONDON HIGHWAYS.

By "VIATOR."

LUBLAND, ANCIENT AND MODERN.—ST. JAMES'S STREET AND PICCADILLY.

(*Concluded from last week.*)

THE Isthmian Club adjoins the Junior Constitutional on its western flank, and was for some years the town resi-ence of that Jewish philanthropist, Sir Julian Goldsmid. Iere, as in the Junior Naval and Military Club, the colossal orinthian order is in evidence, with an effect wholly pleas-ng in the façade now under review. Once again is the con-inuous bow-window a feature. The frontage is altogether ood, the sole adverse comment being that the frieze might ith advantage be slightly less ornate.

The St. James's Club at No. 107 dates back, as "Coventry Iouse," to the year 1764, and is an instance of the application f stucco, without detraction from the architectural qualities f the building. But the adjoining Savile Club presents a iore interesting elevation, quiet and good, with sufficient ecorative effect to hold the attention of the wayfarer.

Other adapted premises must be passed by without com-ient, excepting those occupied by the Junior Athenæum lub, situated at the north-east junction with Down Street, n a house built by a Mr. Hope some sixty years ago. he initial letter of his name is observable on the fine cast-ron railings of the original Hope House, the club extension in Down Street naturally not showing this in the otherwise similar railings. Hope House was the work of T. H. Donaldson and a Mons. Dusillon; the railings just mentioned were cast in Paris and the French feeling in the design is apparent. Generally speaking, the house is poor externally, nor does greater interest attach to the Down Street extension erected in 1887-8 from the design of Messrs. A. Williams & C. W. Simpson. The play upon Mr. Hope's name is observable in the Latin motto accompanying a carved shield and amorini over the main windows. These carvings and the red granite panelling form the sole relief to an otherwise commonplace building, but the boundary railing is the one detail undoubtedly worthy of examination.

Reference was made above to Cambridge House, occupied by the first Duke of that title; further west and near Apsley House, the second duke had his town residence, known as Gloucester House. After his death a few years ago the building was demolished, and a large block of mansions *de luxe* have been erected on the site—if, like the phœnix, as a glorified edition of its predecessor, then indeed Gloucester House must have been very poor. Messrs. Collcutt & Hamp cannot be congratulated here, as in the Strand; in fact, these mansions form one of the few displeasing frontages in Piccadilly. Carrara ware is the facing material employed, and green bands of it are freely introduced, whilst the plinth along the extended Park Lane flank is altogether in the green ware; this plinth, however, looks very satisfactory.

Respecting the façade in general, cut-up columns and architraves are not often tolerable—assuredly they are intolerable here, and the pedimented gable is too cruel for words.

The largest of the private residences are those belonging to the Dukes of Wellington and Devonshire; the latter is mainly the work externally of William Kent in the reign of George II., but it is of no artistic interest, and were it not for the entrance portico (which is of more recent date than the rest) its appearance would be an unredeemed failure. The best parts are the stone urns, acting as supporters to the entrance gates; artistic interest attaches also to the handsome central iron gates removed from Burlington House, Chiswick, one of the duke's residences now occupied as a private asylum. It is unsatisfactory, however, to see these gates set up merely for show, and their appearance would be improved if a carriage entrance were formed in connection with them.

Apsley House has more personal than artistic interest. It was erected in the last quarter of the eighteenth century, and was for a period popularly known as No. 1 London, there being at the time no houses further west within the metropolis. Knightsbridge was formerly a mere hamlet outside London, as were Paddington, Islington, Newington, and many other villages now enclosed within the grasp of our giant octopus. The defects of Bath stone in the London atmosphere were probably less pronounced in the days when the "first gentleman of Europe" occupied the throne of England, for it was at that period that the Iron Duke purchased Apsley House, and employed Messrs. B. & P. Wyatt to face the front with Bath stone and to add the portico and the western wing. Further alterations were effected in the middle of the century by Philip Hardwick. But assuredly this façade does not call for admiring glances, and it will be better to pay some attention to the neighbouring monuments.

The triumphal arch now at the entrance to Constitution Hill was originally vis-à-vis to the screen at Hyde Park Corner; both were the work of Decimus Burton, the former originally supporting an equestrian group of the first Duke of Wellington, executed by Mathew C. Wyatt, who was also culpably responsible for the equestrian group of George III. in Cockspur Street. The Wellington Statue was the object of intense ridicule; but though it was felt desirable to remove it, the old Duke was so hurt at the idea, that the scheme was abandoned during his lifetime, and it was not until 1887 that it was transferred to Aldershot, the arch being then transplanted to its present position. It is understood that an ennobled financier has given a commission to Mr. Adrian Jones to execute a quadriga for the arch, so that eventually the last state of it is likely to be better than the first. For the arch itself it can only be said that there is a sad want of good proportion to the columns and of good contouring for the capitals. The Wellington Monument now erected is a work of art; and though, as elsewhere, the best portions are the subsidiary groups, yet Sir Edgar Boehm has given a fine presentment of the Duke seated on a well-modelled horse, whose quiet but by no means lifeless attitude is preferable to the prevailing uneasy treatment. The Park screen is very good, and a truly marvellous production for a young man, such as Burton was in 1825. Perfect it is not, but no adverse criticism shall be offered here respecting this chef d'œuvre.

Burlington House screen, Piccadilly, does not even admit of such criticism. Its good proportion in mass and in detail, the well-modelled columns, the studied use and distribution of ornament all proclaim the value of Messrs. Banks & Barry's work.

The adjoining arcade, the work of Samuel Ware (1818-9),* does not cause the foot to falter, but the recently-erected Piccadilly Arcade opposite, designed by Mr. Thrale Jell, is worthy of notice, though the entrance-span gives an uncomfortable effect.

A notable trio of architects are represented in this street —Wren, Chambers, Pennethorne. St. James's Church, the work of Wren (1680-4) has been underrated, for without being handsome or even beautiful or picturesque, it is a well-proportioned edifice with a pleasant distribution of brick and stone; but the western tower is not good. Sir William Chambers's work consists of the southern entrance to the Albany, but known prior to 1804 as Melbourne House; it is typical Chambers design. It is only when the third member of the triumvirate is considered that the representative work shown is entirely satisfactory, for the Museum of Practical Geology by Sir James Pennethorne is a good piece of work, such as this architect was wont to produce: objection may be justifiably taken in regard to the intermediate cornice; a façade should have but one. The building is expressive and has the merit of giving equal pleasure in inspecting within and without. Though the entrance front is at the rear in Jermyn Street, yet the Piccadilly façade is treated as the more important.

By Mr. A. Waterhouse's National Provincial Bank there need be no loitering, but our steps must be arrested in fron of two hotels and a restaurant. The Prince's Hall and Restaurant, the work of E. R. Robson, and erected mainly for the exhibition of art collections, is expressive and sufficiently dignified, showing a judicious admixture of plain and ornamented wall surfaces; the medallion treatment too i good. The Ritz Hotel is only noteworthy by reason of the arcade over the footway; good as this is, it would be bette for impost treatment, and the building generally is flat and stale, though, we will hope, not unprofitable.

But the Piccadilly Hotel is very fine, and proclaims Mr Norman Shaw as its author (we refer merely to the elevations). It is a design that calls for unstinted praise, a particularly pleasant feature being the Ionic screen to the overhead terrace. The proportions of the building are very satisfying. It is, however, regrettable that the completion of this hotel should necessitate the demolition of Denman House,* the work of Mr. Harold Woodington, a well designed stone block, which has not yet witnessed two lustres

Space failing us, the consideration of several buildings must be omitted; and after making passing approving reference to the characteristic block by Messrs. Ernest George & Peto, we must confine the closing portion of this article to three pieces of work, the first of these dating back nearly forty years, when it was erected for Henry Sotheran's firm by Messrs. Vaughan & George. It is the most original o all the frontages and has the merit of being Gothic withou being barbaric; it exhibits a curious lack of projection (fo the string courses are nearly flat), and an unusua lack of Gothic exuberance, which is very pleasing. The loggia to the third floor gives a welcome relief to the genera air of flatness, and the angle cable ornament is good. The effect also of the painted glass mural slabs against the Portland stone without framing of any sort is novel and attractive. Medallion portraits of Shakespeare and others provide some additional relief to the flat design.

The two buildings at the junction with St. James's Stree were erected contemporaneously, and have one other facto in common, namely, the use of Pentelic marble as a genera facing; but here the buildings part company, for whereas Messrs. Runtz & Ford have produced a work of architecture in the Norwich Union Buildings, the same cannot be said for the opposite block, which is an example of the neo English style run to seed. There are two satisfactory effect about Mr. John Belcher's building—the grain of the marble and the groups of statuary; after saying that, the wayfare would turn with a sigh of relief to the Norwich Union Buildings, though he (or she) must be of a curious disposition if he (or she) approves the jasper ground storey; this is and must remain incongruous. But the superstructure is very fine, the angle treatment is very vigorously managed and the carving and the bronze groups are admirable, though the lion's-head trusses over the main cornice are not pleasing The oval window-settings to the third floor form another good feature.

Other buildings that might have been desirably included in this article must be regretfully omitted; for we must extinguish our flickering lamp and bid our readers "Au revoir."

BUILT-UP COLUMNS UNDER LOAD.†

IN analytical discussions of column action the stress i usually assumed to vary uniformly from a minimum on one side of the cross-section to a maximum on the opposite side, and the whole cross-section of the column is considered to act as a unit. The longitudinal axis of the column i also considered to take a definite elastic curve under load In the derivation of most column formulas, it is assumed that the amount of deflection of the elastic curve from the original position of the axis is an important element in fixing the maximum stress in the column. Although these assumptions are generally used as the basis of column formulas, it may be well to consider whether conditions may not exist, in columns of ordinary form and dimensions, which will render doubtful the general applicability of some of ese assumptions and will dwarf the effect of others. At any te, it seems worth while to consider the effect of other nditions in a built-up member. It must be borne in mind at the built-up column is subject to imperfections of brication, and that some crookedness and eccentricity must ist. The component parts of the column may be relatively ender and flimsy. Whether there is integrity of cross-ction under load is a question. In the tests that were ade the amount of deflection from the original axis, for ads up to a point somewhat below incipient failure, was und to be slight (generally between 0.04 and 0.1 in.), much aller than necessary to account for the stresses observed in e columns.

---

* This elevation has recently been raised with very good effect.

* See illustration in *The Architect*, April 15, 1904.

† Conclusions from a series of tests made by Arthur N. Talbot and Herbert F. Moore at the Engineering Experiment Station of the University of Illinois.

The action of short columns at failure may be expected to different from that of longer columns, although the stresses to incipient failure may be the same. Granting that the nditions of non-straightness are such that the distribution stress over the cross-section is the same for the two lengths columns, and that the deflection of the column is so slight not to affect materially the stresses developed, the longer lumn will be in more danger of immediate and sudden llapse after the yield point of the material in any fibre s been reached, and the total load carried before complete ilure will, in general, be less. This is because, in a ductile aterial, after the stress at one side of the column has passed e yield point, the total resistance of the section to com-ession will increase, while the resistance to cross bending ay not. Under the conditions named, the bending moment e to eccentricity will be the same until the yield point in me fibre is reached. After yielding begins, the greater flection in the longer column rapidly increases its relative centricity, and more rapid failure may be expected than ith the shorter column.

It will aid in the interpretation of the distri-tion of stress over the channel members of the columns to int out a few simple indications.

1. Any lack of agreement between the average load stress d the average of the stress given for the four centres of avity of channel flanges may be ascribed to errors of obser-tion.

2. If the stress at the centre of gravity of one channel is ove the average stress throughout the length of the column, d the corresponding stress for the other channel is milarly below the average stress, there must be an eccen-icity in the application of the load at the two ends. If the resses at the centre of gravity of one channel member form the diagram a straight line which crosses the line of erage stress, and that for the other channel crosses in the posite way, the eccentricity of the load application must oblique.

3. If the stress at the centre of gravity of a channel in arby points is greater first in one channel and then in the her, the change may be due to crookedness of the column roughout that part of the length.

4. If, in one channel or in one channel flange, the stress the centre of gravity remains constant and that of the treme fibre varies, the change may be due to local crooked-ss of this channel, and there will be a lateral bending this member.

5. If the front side of a channel has a higher stress than e back side, there must be bending action through its web, d *vice versa*.

6. Changing stresses in the diagonally opposite corners a channel may indicate twisting of the channel, and nother combination of stresses may indicate a twisting or lique distortion of the column as a whole.

All these indications were found in the tests.

7. To be in accord with the principles of column formulas the Rankine type, there should be from end of column middle a regular increase in the stress in one channel or in e flange of a channel and a corresponding decrease in the ress in the other. Verification by an agreement between distribution of stress and the theory would be important. his verification was not obtained.

Engineers have often expressed doubt as to whether the arts of a built-up column act as a unit, although column rmulas assume this unity of action. The tests throw me light on the question of the integrity of cross-section nder load. The individual channel, of course, acts as a nit to resist bending action, though there are indications of visting. The integrity of the whole section with reference a plane parallel to the lacing seems probable, except as visting action exists. With reference to a plane through e axis perpendicular to the plane of the lacing, this unity action is not so certain. The tests on the distribution of mpressive stress and likewise the crossbending tests of the lumns indicated that these built-up columns did not in all cases act as a unit, but rather as two members not fully restrained by the lacing. The stresses in two channels as points in the same cross-section do not give the regularity of variation which would exist if the column bent as a unit. The elastic curve assumed by a steel column tested under cross-bending load differs from the computed elastic curve, though that for a wrought-iron column gives little difference. In the case of the posts of a bridge that was tested, however, there is much closer agreement and a seemingly closer approach to unity of action.

The effect of crookedness or other iregularities of a constituent member of a built-up column may be realised if a rough analysis of the case be made. Consider a part of one of the channels forming a column, taking the length between the connections of two adjacent lattice bars. This member is under compression. Owing to non-straightness or to the non-homogeneity of the material, the load on this short piece is not evenly distributed over the section; that is, it is not centrally loaded, but may be considered to have an eccentricity with respect to the gravity axis. Call this eccentricity e. Neglect any deflection of the piece under consideration due to the load. Call the compression load coming on this piece P; A its area of cross-section; I its moment of inertia about the gravity axis, and r the corresponding radius of gyration; and c the distance from the axis to the remotest fibre. Then the bending moment due to the eccentricity is Pe. The maximum stress will be

$$f=\frac{P}{A}+Pe\,\frac{c}{I}=\frac{P}{A}\left(1+\frac{ec}{r^2}\right).$$

The excess of the stress in the extreme fibre of the piece over the average stress, produced by the eccentricity e is then $\frac{P}{A}\frac{ec}{r^2}$, and hence the term, $\frac{ec}{r^2}$, gives the proportionate excess of stress in the extreme fibre. This value is applicable to the channel, or to one flange of the channel, or it may be applied to the column as a whole by using the properties of the whole section. In the single channel under consideration, c is relatively large and r is relatively small, and the excess of maximum stress for a given eccentricity e may be expected to be relatively large. It will be seen that for an excess of 50 per cent. in the extreme fibre of a channel of the steel column tested, e, by this formula, would be 0.045 in., and, in the wrought-iron columns, 0.057 in. A slight variation from straightness in a channel will account for considerable increase of stress.

The tests showed that the compressive stress was unevenly distributed over the cross-section of the columns tested, and also that there was great variation in this distribution at various sections along the length of the column. In a number of sections the excess of stress was from 40 to 50 per cent. In one test of the steel column tested an excess of 67 per cent. was found, and in the bridge an excess of 73 per cent. Possibly these values were unusual or the observations were erratic, but the indications of a fibre stress of from 40 to 50 per cent. in excess of the average stress were not uncommon.

It may be that among the causes to which the high fibre stress may be attributed are (a) non-straightness of the column as a whole, (b) non-straightness of the component channels, or eccentricity in the delivery of stress to them by the lacing, and (c) unknown eccentricity in the application of the load. It would be of interest to know how much of the increase of stress may be due to any one of these conditions. Generally only a small amount may be said to be due to non-straightness of the column as a whole. In but few cases is it found to be more than, say, 5 per cent.; in four places it seemed that the excess attributable to this may be estimated to be between 20 and 25 per cent. The effect of non-straightness of the individual channels seems to be greater. At several points the excess of stress attributable to this cause appears to be from 30 to 50 per cent. As already noted, a kink in the channels of 0.045 in. would give, by the analysis made, an eccentricity sufficient for a 50 per cent. increase in stress. Not all of this crookedness need be between adjacent rivet points, as the stress may not become normal for some distance on either side. The effect of the third condition, eccentricity of application of the load, will vary with the construction. In the steel column tested the effect of undetermined eccentricity of application of load appears to be not nearly as great as the effect of non-straightness of the component channels.

In the wrought-iron columns, which were much stockier, the lack of straightness in individual channels has less effect, seemingly less than 15 per cent., and much the larger part of the high fibre stresses appears to be due to general column eccentricity or to eccentricity of loading.

The results for the posts of the bridge tested are of interest in this respect. It is evident that the effect of non-straightness of channels was not large, and also that the effect of non-straightness in the column as a whole was relatively small. There was, however, an evident bending in the direction of the web of the channels. For example, in one post the back side of the channels has the maximum stress at the top and the front side at the bottom. The bending moment producing this may be due to obliquity of end pressures or to a bending by the connecting floor-beam and top chord. A twisting action is also apparent. Other posts gave quite similar results.

In the tests of the bridge the effect of the cover-plate seems striking. The upper chord, composed of two built-up channels with one cover-plate, gave an excess fibre stress of 20 per cent. at the worst section, while the post, composed of two channels laced on both sides, gave a maximum of 73 per cent. The high value in the posts may be due to other causes, but it seems reasonable to expect that the cover-plate will act to reduce the irregularities in fabrication. Engineers have stated that columns having a cover-plate are fitted into their places during erection with less labour than is required for columns with lacing on both sides. Tests on the stress distribution of such columns would be valuable as affording a basis on definite comparison.

The connections of the ends of posts evidently exerted a very noticeable effect on the stress distribution. In one of the posts tested the stress was greatest at one corner of the post at the top and at the diagonally opposite corner at the bottom. The posts were rivetted to the top chord, and were connected with the lower chords by pins. The floor-beams were rivetted to the sides of the posts, and this connection affects the stress distribution. Readings of deformations taken on the floor-beams and posts show that the loaded beam was partly restrained at the ends by the post, though this restraint introduced a bending moment at the end of the post only about one-quarter as great as at the centre, and that there was an appreciable bending in the post.

If the load carried by one channel of a column was the same throughout its length, no stress would be carried by the lattice bars. Such stress is developed whenever there is a change in the relative amount of loads carried by the two channels. If, at some sections there is an equal division of load between the two channels, and if at some other section the division of load is unequal, it is evident that the lattice bars must be called into action to transmit this stress, and that transverse shear exists in the interval. In general, the conditions producing this will be complex, rendering analysis unsatisfactory, except in so far as the shear may be due to a known eccentricity of loading.

It was evident from the tests that the relative stress in the two channel members varies considerably from end to end, and that the stress in the lattice bars also varies. It seems probable that the transverse shear developed may be traced largely to irregularities in outline, or at least that these irregularities may be expected to cover up other causes of stress in the lacing of centrally-loaded columns, if we include in such irregularities all unknown eccentricity. The futility of attempting to determine analytically the stresses in column lacing, using as a basis either a bending moment curve which varies regularly from end to middle or an assumed deflection curve, is apparent from a study of the variation of stress in the columns of the tests and in that of the lattice bars.

The amount of transverse shear necessary to produce the maximum observed lattice-bar stress is of interest, though, of course, it cannot be taken to be conclusive. The measurements were generally made at working loads. So far as observations were made on columns tested to failure, the distribution of stress remained much the same up to incipient failure.

In the discussion of stress developed in column lacing, the stress considered was the average over the bar. As usually attached, there is considerable flexure in the bar, and the ability of the bar to carry this eccentric load should be considered. The bars are most likely to fail in compression, since they act as long columns eccentrically loaded. This compressive strength may be greatly diminished by the bending which they frequently receive in transportation and erection.

The tests of individual lattice bars showed that the maximum fibre stress may be several times the average stress. It was also seen that even in a short lacing bar the maximum load carried is only about one-half the yield point of the material. The necessity of using very low working loads on lattice bars appears to be important. It was noted that at low stresses there is similarity of distribution of stress in the slender bars and in the thicker bars, but the slender bar fail at smaller computed fibre stress.

The results of tests to destruction of individual lattice bars (flats) are fairly well represented by the formula:

$$\frac{P}{A} = 21{,}400 - 45\frac{l}{r}$$

where P = load at failure in pounds, A = area of cross-section in square inches, l is the distance in inches from centre to centre of rivet holes, and r is the radius of gyration, in inches, of the cross-section of the lattice bar. The results of the tests were adjusted so that this formula applies to material having a yield point of 40,000 lb. per square inch. These results may be considered to be applicable to "under" lattice bars. For "over" bars it seems probable that the average stress at failure would be considerably less. If $\frac{l}{r}$ is 0 in the above formula, that is, if we have a very short lattice bar, the average stress over the bar at failure would be 21,400 lb. per square inch. If the extreme fibre stress in this short bar is 40,000 lb. per square inch, the yield point of the material, the equivalent eccentricity of loading (e) which would produce this may be found from the equation

$$40{,}000 = 21{,}000\ (1 + \frac{e \times \frac{1}{2}t}{r^2}),$$

where t is the thickness of the bar. The resulting e is found to be very nearly $\frac{t}{7}$. We may then regard the lattice bar to have been loaded with an initial eccentricity equivalent to $\frac{1}{7}$ the thickness of the bars.

The large variation in stress over a cross-section of the column and the marked changes in stress from section to section along the column are evidently due to local crookedness, local eccentricity, lack of rigidity of lacing, and other variations which may be independent of the general flexural curve usually assumed in deriving the usual formulas for column strength. It would seem that the form of section (including in this term the relation of the thickness of the metal to the section as a whole) has a bearing on the strength. The thinner and flimsier component angles and channels are more liable to receive kinks, bends, and distortions before and during punching and riveting in the shop and in the later transportation and erection than are the stockier sections. The value $\frac{ec}{r^2}$ of the formula given above may be expected to vary with the form of section used. Besides, some sections are better fitted to withstand lateral twisting or diagonal distortions and to preserve the integrity of the cross-section than others. The wrinkling tendency in plates and thin parts under compression, heretofore referred to, is another element affecting the strength of columns. It may be expected, then, that differences in section, in type of component parts, in method of relating and tying the parts together, and for the same type of section differences in relation of thickness of parts to extreme dimensions of sections, will have an important influence upon the compressive strength of columns. It follows, therefore, to give the best results, that the section of the column, and its web construction, should be chosen so that (1) the shop processes shall leave the component parts of the column in the best condition (giving the minimum of bending, buckling, twisting, and interior eccentricity), and (2) the section will be adapted to resist local lateral bending and twisting action. Evidently, different forms of section may be expected to give considerable difference in strength. This difference has been recognised heretofore in formulas which have been proposed and used for certain types of columns.

A study of the tests does not show any relation between the stresses actually observed and the stresses computed by column formulas. The high stresses do not come where the curve of flexure used as the basis of formulas of the Rankine type would place them, and the position and amount of the maximum stresses are very irregular. Although there was little range in the slenderness ratio $(\frac{l}{r})$ of the columns tested, no effect was noticeable for which the value of $\frac{l}{r}$ would seem to have much influence. This view seems to be in disagreement with theoretical considerations. The lengths for which Euler's formula may be expected to govern column strength are much greater than the length tested, and probably are higher than is generally assumed in engineering literature. Within the critical length at which Euler's formula governs, the general flexure of the column as a whole under load has less influence upon the strength of the column than is ordinarily assigned to it, and therefore the influence of $\frac{l}{r}$ is not as great as is represented in the usual column formula. Of course, the longer the column the more the amount and influence of its defects may be. The recent tests of columns at the Watertown Arsenal indicate that, within the range of lengths tested $\frac{l}{r}$ (25 to 175), the reduction in strength at elastic limit with increased length is relatively small, perhaps not much more than may be due to increased variation from straightness and homogeneity. In this connection it should be noted that the column formulas in common use give altogether too high strengths for short columns, if the elastic limit is to govern. So far as ultimate strength is concerned, tests show the strength of short columns to be considerably above their elastic limit, but beyond a limit of, say 35, for $\frac{l}{r}$, there is much less difference between elastic limit strength and ultimate strength.

That the column formulas in common use have limitations has been well understood, but the effect which the conditions of the component parts of a compression member exert on the distribution of stress over the section has not been appreciated, nor has that of eccentricity of connection of latticing, and of the possible non-integrity of section. It would seem quite probable that, for columns of the same length and containing the same amount of metal, one which is of stocky form and in which the metal is distributed so as to resist local flexural and torsional action will be much stronger and more satisfactory than a column of more flimsy form, which has its metal spread in thinner sections, even though the slenderness ratio, $\frac{l}{r}$, of the former may be considerably more than that of the latter. It seems reasonable to expect that a form of section which resists lateral bending, torsional and collapsing stresses, will be much more satisfactory than a more flimsy type of column, for the lengths most common in ordinary bridge construction. If these statements are trustworthy they express an important principle. For the longer lengths the slenderness ratio must exert a stronger influence. For the strength of the component angle, channel, or other structural shape used in a built-up compression piece, many engineers have been satisfied with the provision that the slenderness ratio of the component member shall be less for the length between the points of attachment of lacing than the slenderness ratio for the column as a whole, and have given little attention to the possible non-integrity of the section or to the probable effect of imperfections of manufacture. Fortunately, the large influence of the slenderness ratio in column formulas has given sections with which failures have not occurred. Whether a column formula should include a factor depending on the form of the section and the relative thickness of the metal, or whether the allowable stresses for any form of column should be based on experimental data for the section used, will depend on future developments.

The tests that were made have shown the practicability and also the importance of making tests on the distribution of stress over built-up columns within the elastic limit, both under laboratory conditions and in field service. It is evident that much experimental information is needed on the stresses which are developed in compression members built under ordinary conditions of fabrication and erection before a satisfactory column formula may be established. Tests giving the needed information involve extreme care, and they are expensive, with regard to time and labour, whether done in the field or in the laboratory. A full study of the action of the compressive piece under loads which do not stress the material beyond the elastic limit should be included. The expenditure involved is far beyond that of tests to destruction alone. An investigation should be accompanied by a careful study and analysis of the tests and results. A programme of tests need not involve a large number of test pieces; but, to be really useful for the purpose in view, the time devoted to the test and the study of each piece must be ample, and the total cost of even a fairly comprehensive investigation will be large. It may be expected, however, that the value of the results would repay many times the cost of the work, and the expense would be justified by the added security and, perhaps, by the economy of metal which might result from the investigation.

(*To be concluded.*)

RURAL HOUSING.*

IT may in one sense be somewhat discouraging to those who have to administer our system of local government to feel that there is no finality about their work. As soon as one set of conditions which calls for attention is disposed of another appears to crop up, and possibly at this moment there is no more important work ready to hand and almost universally demanding early attention than the question of the better housing of the working classes. If it is not universally the case, it certainly prevails in many parts of rural England that the cottages of the labouring classes are by no means sufficient in numbers, and frequently the rooms in those which exist are inadequate for the proper and decent accommodation of a growing family. The importance of remedying these evils where they exist cannot, I think, be over-stated. Better and more efficient housing would materially assist in the solution of many of the social problems which affect our rural population. Take, first, the question of drink. Many a poor hard-working farm labourer is driven to the public-house where money is spent which is badly needed at home because he cannot find a place in his own house where he can take a few hours' rest. Then, again, take the question of consumption which we are all trying to tackle. In how many cases is bad housing—overcrowded sleeping rooms badly ventilated—the cause of the first appearance of this dread disease in a family, and when it has once found a victim what a danger there is in respect of other members of the family who must of necessity occupy the same rooms reeking with the infection. Then, again, there is the no less important question of moral tone which must suffer where the sexes are occupying houses with insufficient accommodation for proper and decent habitation. There are other evils arising from such a condition of affairs, but possibly I have instanced enough to prove how important it is to do what can be done to remedy a condition which is full of danger, and the responsibility of full enquiry now rests upon District Councils who, coupled with that responsibility, are now armed with full powers to cope at least to a large extent with this important social problem. Unfortunately in many parts of rural England the customs relating to the tenancy of cottages militate against the want being supplied by private enterprise. In the part in which I have most experience it is the practice of tenant farmers to let the cottages occupied with their farms, which may or may not be sufficient for their workmen, at a rent of 1*s.* or 1*s.* 6*d.* a week; in some cases the workman occupies free of rent. At such a rent as this it is quite impossible for private enterprise to compete, as unfortunately these rents approximately fix the price of cottages in the neighbourhood. The farmers are not to be blamed for this. I have spoken to more than one on this point and asked why proper remunerative rents cannot be charged, and the reply always is that in that case wages must be raised all round, and the economic conditions of agriculture to-day render it difficult to make both ends meet in any case, and if the wages bill were materially increased it would be impossible. Where cottage room, therefore, is insufficient, and there is no chance for private enterprise, there still remains the moral obligation of the landowner, but here, again, economic questions have to be considered, and it often happens that landowners with their reduced rents and heavier taxes are not able to spend the money necessary; others may be unwilling where such expenditure is a bad investment; some may from motives of philanthropy supply the want, but in the majority of cases it having become the duty of the local authority where conditions exist which call for a remedy to supply the necessary housing, it must be to the local authority that the country must look to act.

I fear there is some hesitancy on the part of local authorities to put in force the powers they now possess. Since the passing of the 1909 Act only nine out of a total of nearly 700 Rural District Councils have applied for loans for building. A housing scheme need not as a general rule entail much loss on ratepayers, if any, and in some cases it has been found with proper and careful management it has been made to pay its way, and where houses are sorely needed and there is a probability of making both ends meet, there does not appear to be any financial reason why such schemes should not be carried out. There is, however, another reason which doubtless affects the judgment of many members of our local authorities, and that is the possibly unfair competition with private enterprise—unfair because money can be borrowed on much better terms both as to interest and period of repayment by local authorities than by private individuals, but where both the general welfare and health of the local community is in danger, it is submitted that the consideration of private interests should not prevail.

---

* **A Paper by Mr. G. F. Slade, clerk to the Wallingford and Crowmarsh Rural District Councils, read at a conference of Rural District Councils of England and Wales at the Guildhall, London (organised by the Rural District Councils Association).**

The proper carrying out of their duties by District Councils is much hampered where housing accommodation is insufficient. How often have members here present received reports from their sanitary inspectors of overcrowded houses and been practically unable to insist upon the nuisance being immediately abated by reason of the fact that there is no other house available for the overcrowded family. Take the case of a labourer living in a small cottage with only two bedrooms, and plenty such exist; there is himself and his wife, and possibly five or six children, ranging from 14 to 2 years of age, to be accommodated with sleeping room. The Inspector reports the case as one of overcrowding—there is no house in the village or near to the man's work available; what is to be done? Is he to be turned out in the road? or is the unhealthy condition to be allowed to continue? Where conditions exist such as I have attempted to describe, and I venture to think that in a greater or lesser degree they exist in most parts of rural England, the Legislature has given ample powers to Rural District Councils to provide a remedy, and where the evil exists and power is given to remedy it, surely it follows as a necessary consequence that an imperative duty arises to exercise such power and mitigate such evils. District Councils are on their trial, opportunities are given to them, and these opportunities imply obligations, and I venture to predict that the future existence of our Rural District Councils as a separate and independent local authority to a very large extent depends upon how we exercise those powers. I hope it may be a very long time before the present District Councils will lose any of the powers they now possess; in fact, I should like to see them extended, but depend upon it this will never be done if the duties already imposed upon us by the Legislature are not satisfactorily performed, and to my mind the most important at this moment is the question of housing.

Now what powers has the Legislature given us?

Under the Housing and Town Planning Act we are directed to make, first of all, a careful inspection of our several areas, and to procure a record of the condition of the houses under a certain rental in every village. The provisions relating to this inspection are, I venture to suggest, defective in some important and some minor particulars. In the first place, as a minor detail, it would have been much more convenient if the standard had been fixed on rateable value, with a provision that the assistant overseers should make a return from time to time of the cottages and dwelling-houses in their respective parishes under the standard. It is not always easy to find out the exact rents, but this is not a serious obstacle in the way of carrying out the intentions of the Act.

Another point of more importance is that the records contain no general or specific information as to the sufficiency in number of the houses in a village or district; it does not in itself give the information that would be most useful as to whether more houses are required, nor any definite statistics that would lead to such a conclusion. Councils may, however, prosecute their enquiries quite easily for themselves.

Another matter that I submit might have been differently dealt with is the provision in Section 15 that landlords shall during the tenancy of houses where the contract for letting is made *after* the passing of the Act keep the houses in all respects reasonably fit for human habitation. It would have been a great help to District Councils if some provision could have been made that after a certain period, say six months from the passing of the Act, all houses coming within Section 14 should be put and kept by the landlord during occupation in all respects fit for human habitation. It is difficult to see why an old tenant is to lose the benefit of the section. Then, again, it appears to me that by Section 15 the power of the local authority to do repairs in default of their being done after notice by the landlord and recover the amount as therein provided, only applies to tenancies coming under Section 14. It would have been helpful if this power had extended to all houses and not been limited to new tenants. It would also have been useful to local authorities if some provision had been made whereby they might under statutory authority have specified to a landlord the maximum number of persons certain houses could properly accommodate, so that the landlord might know definitely when he was committing an offence by permitting overcrowding, but notwithstanding these suggested defects upon which there may be great diversity of opinion, the Act now puts it easily within the power of local authorities not only to effect very great improvement in the existing dwellings of the working classes by enforcing good sanitary conditions, but makes the procedure for the building of new ones much more simple and expeditious than it has been under the older Acts.

District Councils can now purchase land and build without going to some other local authority for sanction. If difficulties arise as to the price of land required, there is a simple, cheap, and expeditious method of settling the question by the arbitration of the Local Government Board. If money has to be borrowed, which in almost every instance will, I presume, be the case, it can be obtained for long terms at low rates of interest; in fact every reasonable business facility is provided for carrying out the work, and provision is also made in cases where the necessity for building arises only in one or more contributory places in the area of a District Council for making, with the sanction of the Local Government Board, the cost of such building and the loss, if any, a charge on that area alone.

Where such simple methods of procedure are provided, it is difficult to excuse a local authority where necessity exists for making use of their powers, but in cases where local authorities do not do so the Act further provides that four inhabitant householders, not of the particular parish but of the district, or the Parish Council or the County Council, may set the machinery in motion by applying to the Rural District Council to carry out their powers under the Act, and in the event of continued neglect on the part of the Rural District Council to do so, application can then be made to the Local Government Board, who will enquire into the complaint, and if it is found to be well founded may require the District Council to carry out the required work or transfer their powers to the County Council, with the consent of such Council.

Another important provision contained in the Act is the power given for the first time to the local authority to make and enforce a closing order where a house is proved to their satisfaction to be unfit for human habitation. Hitherto this power could only be exercised by a Court of Summary Jurisdiction, and this new provision appears to me to be only another proof that the Legislature is desirous of increasing the powers and with it the responsibilities of Rural District Councils, and I will conclude my paper by expressing a strong recommendation to the Rural District Councils to see to it that these new and important additions to their powers shall in the future be carried out in such a way as to justify the Legislature in still further making use of these authorities in the future as occasion may require.

HIGH-PRESSURE WATER SUPPLY IN NEW YORK.

IN New York City the authorities show much satisfaction with the working of the high-pressure system for fire protection, though its installation there has barely passed from the experimental stage. No attempt had been made to install a mechanical high pressure, worked from a central station for fire-fighting purposes exclusively, prior to that of Philadelphia in 1904. At that time the necessity of maintaining continuous steam pressures in order to drive the pumps for the service retarded the final adoption of the high-pressure system until the plan of utilising a gas engine in place of the steam engine was proposed. The New York system, however, has made a new departure in that the motive power is that of electricity.

The area protected by the high-pressure system in the boroughs of Manhattan and Brooklyn cover the high value, wholesale, commercial, and manufacturing districts, waterfront property, and part of the congested tenement district in lower Manhattan. Some 21,000 acres are included in this area, with some eighty miles of main and 1,900 fire hydrants of special design. Two electrically-driven pumping stations, with a rated capacity of 3,000 gallons per minute at a discharge pressure of 300 lbs. per square inch, furnish service on every alarm within the high-pressure zone.

The main advantage for this system over the use of portable fire engines lies in the power it affords of attacking a fire at its very outset, and of bringing to bear at once a constant high pressure. It is, moreover, far more economical. The total annual cost of maintenance of the Philadelphia pumping station, including wages and gas, is less than the average cost of maintenance for one fire engine per year. Especially in the case of high values in a congested area, such as the dry goods district of New York, the installation of the high-pressure system has been attended with marked success, and its extension throughout the whole area of Manhattan is already under consideration.

Comparing the costs of running gas engines and electric-driven engines, the chief engineer of the New York Department estimates the cost for current alone for pumping 1,000 gallons of water by electricity to be 4*d*., while the cost for pumping the same amount of water by gas-driven pumps would be about 1*d*. for gas only. The total cost of maintenance, including gas, wages, &c., in Philadelphia is stated to be 2½*d*. per 1,000 gallons of water pumped. Water is delivered from the electric pumps at a much higher rate than from the gas pumps. The outflow of the electric pumps, though rated at 3,000 gallons, averaged in the great fire of January 1910 nearly 5,000 gallons per minute, while the gas-driven pumps of Coney Island showed at the fire of July 1907 an average effluent of about 1,450 gallons.

THE GEOLOGY OF BELFAST AND ITS PUBLIC HEALTH ASPECT.*

To the engineer, and particularly to the engineer engaged in the branches of engineering connected with water supply and drainage, the geological characteristics of any neighbourhood are of interest chiefly from three standpoints: the stability or otherwise of the strata near the surface; the presence of water-bearing strata, and the depth at which such may be found; and the relationship of the condition of the soil to disease.

Belfast is almost entirely built on alluvial deposit, so far as the lower lying portions of the town are concerned, this material being replaced by red clay in the higher districts. In certain parts a considerable area is "made ground."

Of the latter two it is unnecessary to say anything from a building standpoint, as their characteristics are well known. The alluvial deposit consists of a material which looks like a blue clay, and on first being exposed to the air is of an extremely solid appearance. If, however, it is exposed to wet it becomes a semi-fluid, oily material, which will find its way back to any trench from which it may have been taken if left near the edge. A case is on record where the excavated material was left on the edge of the trench, and after a night's rain the trench was again filled.

For excavating in this material close timbering is essential to safety, and although local contractors often try to dispense with much of the timber necessary to completely sheet the sides of the trench, the risk is a large one, and the writer has seen several cases of accident owing to this.

The usual method of supporting large buildings is by piling the foundations, the method of carrying down concrete pillars or other similar construction to the underlying solid stratum being much too costly owing to the depth at which the latter is usually found. As a rule the piles are of larch, and the specification as to driving is that the pile shall be driven until a weight of, say, one ton falling ten times from a height of 5 feet shall not cause the pile to sink more than a ¼ inch.

Over the top of the piles are fixed whole timbers, and between and over these is placed concrete, so that in effect the buildings are carried on a raft. This method of construction has proved perfectly satisfactory, and is much less costly than taking down solid foundations to the hard bed would be.

Where no great weight has to be carried, and there is a fairly hard crust on the surface, it has been found that it is quite safe to build on top of this crust, and not pile, and some of the smaller buildings are built thus.

The second consideration is that of the occurrence of water-bearing strata, and in this connection a few remarks as to the geological characteristics may be interesting.

Belfast itself lies in a saucer-shaped depression, bounded on the north-west by the Antrim Mountains, and on the south and south-east by the Holywood and Castlereagh Hills, the latter two separated by the Dundonald Valley. The Antrim Mountains are the eastern edge of the tertiary basalts of the North of Ireland. Beneath the basalts lies the chalk, the two being commonly separated by an irregular bed of flint gravel. The chalk here appears much in advance to the north-west of its position in England—one of the most curious facts in the geological story of the British Isles.

As before remarked, from the basaltic escarpment to the hills of Down, the superficial layer is composed of estuarine clay. The limits of the estuarine clay in Belfast itself are a cliff of new red sandstone, which may be seen near the Northern Counties Railway. The Newtownards Roard marks the boundary of the estuarine clay on the County Down side.

The boring at East Bridge (Corporation Electric Station) gave the following result:—

		ft.	in.
Rough formation		2	0
Hard and soft concrete		4	0
Estuarine clay		16	0
Heavy close gravel.	? Post glacial	14	0
Hard sand and gravel	Glacial	4	0
Heavy clay		3	0
Fine close gravel, shell, and stone		8	0
Red clay with stone		6	0
Hard gritty sandstone with blue stone under (Triassic sandstone with Basalt dyke)	Triassic sandstones	7	0
Red sandstone		85	0
Hard dyke rock (Basalt dyke)		3	0
Fine red sandstone		114	0
,, ,, with clay marl		19	0
Red sandstone		160	0
Tough clay and sand.	Lower marls	3	6
Red clay and hard stiff marls		39	6
Hard red sandstone with layers of magnesia	? Permean	18	0
,, ,, with clay marl		30	0
,, ,, showing more clay		18	0
		554	0

The bore was 10 inches in diameter to a depth of 68 feet, and 8 inches diameter thence to the bottom.

At 35 feet depth the yield was 2,200 gallons; at 448½ feet it was 2,700 gallons; and at bottom 6,500 gallons, with an air pressure of 112 lbs. per square inch.

When excavating for the foundations of the Albert Bridge the strata met with were as follows:—

	ft.	in.
River mud with coarse sand	10	0
Lower estuarine clay	14	0
Gravelly bed	1	0
New red sandstone	—	
	25	0

The third record is taken from the excavation made for the Alexandra Dock:—

	ft.	in.
Surface clays	6	6
Yellow sand	2	0
Upper estuarine clay	6	0
Lower estuarine clay	6	0
Grey sand	2	0
Peat	1	6
Grey sand	2	0
Red sand	4	0
Re-assorted boulder clay (base not reached)	15	0
	45	0

As we get away from the low-lying parts of the city we find that the boulder clay is the usual surface stratum, overlying sandstone.

The geological characteristics of the surrounding country are varied.

The supply of water for Belfast and most of the surrounding towns is derived from streams draining the high lands round about. To ensure the purity of its supply, Belfast has purchased its whole catchment area, but the smaller towns have not taken this precaution, and in some cases the freedom of the source from pollution is not above suspicion. Sand-filtration is usual, and serious epidemics caused by impure water are rare.

In many of the smaller towns, and on most farms, the supply of water is obtained from surface-wells, and it is unnecessary to say how unsatisfactory this source is. Many of the medical officers have frequent analyses made, and attention drawn to the purity or otherwise of the water; but in no community, however small, should such a source of supply be used. The question of expense is too often taken into consideration, more particularly by Rural District Councils, the members of which are usually satisfied by having a well "cleaned out" when the water derived therefrom is shown to be polluted.

---

* Abstract of a paper read before the Congress of the Royal Sanitary Institute at Belfast by Mr. J. Stilwell Munce, B.E., A.M.Inst.C.E.

Of course, it must be admitted that for many small authorities, with low rateable value, to do away with all surface-wells and to obtain a supply from an unimpeachable source, would lay a very heavy burden indeed on their shoulders, but to me it seems that here we have a strong argument in favour of the nationalisation of water supply.

From surface-wells it is an easy transition to speak of the relation of soil to disease. It is stated that at a depth of some feet bacteria cannot exist in the soil, and that, therefore, it is only from the surface-layers that disease can be propagated. On the other hand, some distinguished scientists have adduced that active putrefaction can take place in the deeper layers, and if the surface remains permeable, the products of this putrefaction can make their way to the surface. On this point it may be noticed that in any place where considerable fluctuations of sub-soil water occur there this fermentation is most active. Moisture and a moist condition of the medium, as opposed to absolute dryness or wetness, is the most favourable condition for this fermentation to take place. This condition is produced when, after a dry spell, a sudden rise and then a fall takes place in the level of the sub-soil water, leaving the stratum passed through in this moist state. Certain observers have stated that then is the time that certain diseases are most common.

Four diseases in the main are stated to have a close relationship with the soil: cholera, phthisis, diphtheria, and typhoid.

The first is not common about Belfast, and it is only necessary to say that where we have an impermeable soil, or a constant level of the sub-soil water, there cholera is rare.

But if cholera is rare, the same cannot be said of phthisis, for this is the cause of more deaths, not alone in Belfast, but in Ireland, than any other disease.

It is not usual in Belfast to require the site for a dwelling to be covered with an impermeable material, except where, in the opinion of the surveyor or medical officer of health, such covering is necessary; but it is always insisted on in the case of tilled ground. Now, the soil of Belfast is of a nature which makes it very retentive of moisture, and this moisture is certain to be drawn up through the layer of brick rubbish or ashes, which is the usual covering, into the living-rooms. Any products of the fermentation previously mentioned accompany it, and the result can be understood.

In addition, however, many houses in Belfast have been built on made ground, the filling used being refuse. Now, it is sometimes stated that all this material is entirely free from anything at all objectionable after three years. It may be, but it is open to question whether such be the case so far as regards the surface layers at least. It is a questionable policy on the part of a large sanitary authority to permit houses to be built, without an impervious covering to the soil, on top of what is to all intents and purposes a refuse head.

The relation of the soil to this disease in the rural districts is fairly clear. About the usual farm-house there is usually no means of draining even rain-water away. Slops of all sorts are thrown from the doorway, whilst in many of the houses the floors are of earth, and any liquid which falls on it slowly evaporates, with the result that the inmates are breathing an atmosphere more or less saturated with moisture and microbes.

It seems, then, that no great reduction of the number of cases of phthisis can be expected so long as the soil is permitted to empty its moisture into the dwellings, although a slight expenditure (at first) might have prevented much suffering.

The occurrence of diphtheria is stated to be due to dampness of foundations, and again this emphasises the necessity of making the whole site below a house impermeable to moisture.

And, lastly, typhoid authorities greatly differ as to the relationship between the soil and the occurrence of cases of typhoid.

The conclusion one is forced to is that there is a direct relationship between soil and disease, depending on—(1) The level of the sub-soil water; (2) its fluctuations or the reverse; (3) the comparative retentiveness of the soil; (4) the state of cleanliness of the surface, *i.e.* its freedom from masses of filth left to decay.

The effects of all four can be overcome; it is for those who know how to explain to their more ignorant or careless brethren.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Metal Lamp Patents.

Sir,—Our attention has been called to a statement under the above heading appearing in your journal of the 18th inst., addressed to you by the Osram Lamp Works, Ltd., to which is appended a notice of an order made in reference to an action brought by that company against the British Tungsten Lamp Company, Ltd.

As one of the various manufacturers referred to in that letter against whom litigation has been commenced, we desire to call your attention to the fact that the order referred to was made with the consent of the defendants, who took no steps to defend the action.

The business of the British Tungsten Lamp Company, Ltd., was in the hands of a Receiver for the Debenture holders, who did not feel justified in contesting the proceedings. The point is material, as your correspondent's letter might convey the impression that the order was the outcome of an investigation by the Court.

We may add that the proceedings instituted against us are being defended, and we are content to await the decision of the Court.—Yours faithfully,

The "Z" Electric Lamp Manufacturing Co., Ltd.,
Kilburn, Brown & Co.,
Managers.

New Broad Street, August 26.

Public Lavatories.

Sir,—It is nearly a year since I last wrote to you on this subject, and I am sorry to say it calls for attention as much as ever. In October of last year I wrote to call the attention of your readers to the fact that the public lavatories in Trafalgar Square were not accessible before 9 o'clock A.M. I ventured to describe this as little better than a public scandal. My letter resulted in several communications thanking me for what I had written, and expressing a hope that I would press the matter on the attention of the public authorities until the public are given access to the lavatory accommodation which is provided out of the public purse. One of the letters received was from the Chairman of the Public Health Committee of the City of Westminster, who, referring to my letter, wrote: "I should like to inform you that the matters dealt with therein have been for some time past the subject of discussion between the Public Health and the Works Committee." That was more than ten months ago. Matters are evidently not rushed in the Westminster City Council. I hope you will be good enough to publish this letter; it may help the discussion between these two important committees, and I can assure you from my experience of this morning large numbers will thank you if the result should be an earlier opening of the public lavatories.—I am, &c.,

Mark H. Judge.
Surveyor to the Sanitary Assurance Association.

Shoreham and its District.

Sir,—In the illustrations accompanying "Shoreham and its District" in last week's *Architect*, the names of old and new churches have inadvertently been changed; the first illustration shows that of Old Shoreham Church and the second that of New Shoreham. In the description of Old Shoreham the windows of the north and south transepts are referred to, but no mention is made that they are new. Before 1840, when repairs were carried out under the Cambridge Camden Society, the church was in a bad state of repair: wooden frames with mullions lighting the nave, the door in south transept blocked up and partly covered with earth. In an appeal issued on behalf of the repairs the north transept is stated to be in ruins and walled off from the church. The description of the restoration says a window was inserted in the Norman buttress of north transept, "copied exactly from one similarly situated in Clymping Church, Sussex." No mention is made of the south transept window, but my recollection of it is that it is also new, copied from one at another building. There appears to be no authority for the windows of nave and transepts except their being "in the style." Of the chancel windows sufficient remained for the construction of new. The western part of the north wall of nave, and probably the west end, are the remains of an earlier building.—Yours truly,

William G. B. Lewis.

ZINC OXIDE.

THERE can be little doubt that we are in this country within measurable distance of following the example of France and other countries in the legislative prohibition of the manufacture and use of white lead, and it will therefore become necessary to adopt some other material for the standard or general base of oil paints.

The use of white lead as a basis for paint is without question responsible for a great deal of lowered vitality and injured health, and in many cases for definite lead poisoning and even death amongst those who make and those who use it. White lead poisoning, if incurred in the course of a workman's duties, is legally an "accident" within the meaning of the Workmen's Compensation Acts, and the Board of Trade regulations as to white lead factories are at the present time very severe, and in order to avoid the rigorous enactments in connection with such works several paint manufacturers have given up grinding white lead. The disuse of white lead entirely is therefore only a question of time and of a very short time.

The superiority of zinc oxide or zinc white, from the point of view of health, has been recognised for a considerable time, and with praiseworthy persistence its manufacture has been carried on and its use advocated by a few enlightened manufacturers, prominent amongst whom have been Mr. J. B. Orr and the Silicate Paint Company.

Zinc oxide has also been increasingly used in the manufacture of anti-fouling compositions for ships' bottoms, protective paints for iron and steel, enamels and enamel paints, fireproof paints, and tempera paints. Zinc oxide has peculiar chemical and physical properties which make it specially fitted for these purposes. Thus in the preparation of enamels the property of combining readily with the acid bodies in the gum resins makes the material pre-eminently adapted for being ground in suitable varnishes or varnish-like preparations.

Permanency of colour and durability of film are under the best circumstances characteristic of zinc oxide paints, and are sufficient to outweigh the disadvantage of increased first cost as compared with white lead, so that over a term of, say, twenty years, involving repeated renewals, the use of zinc white paint is more economical in the long run.

One of the stock objections that have been made in the past to the use of zinc oxide for paint is that a greater number of coats are required to produce the same opacity of white as with white lead. This is true, but the objection vanishes when zinc white is used for making up coloured paints. The greater spreading power of zinc oxide which makes each coat of pure white thinner, and therefore a larger number of coats necessary to produce a definite effect, is an advantage when a stain or colouring pigment is added, and a greater surface can be covered with the tinted mixture just as efficiently as a mixture of the stain with white lead can cover a smaller surface.

The extent of the gain of covering power with body or opacity will vary in every case with the pigment used and the amount of it added; but if the colouring pigment is a strong opaque colour there will be very considerable economy in using zinc oxide in place of white lead to make up the desired tint.

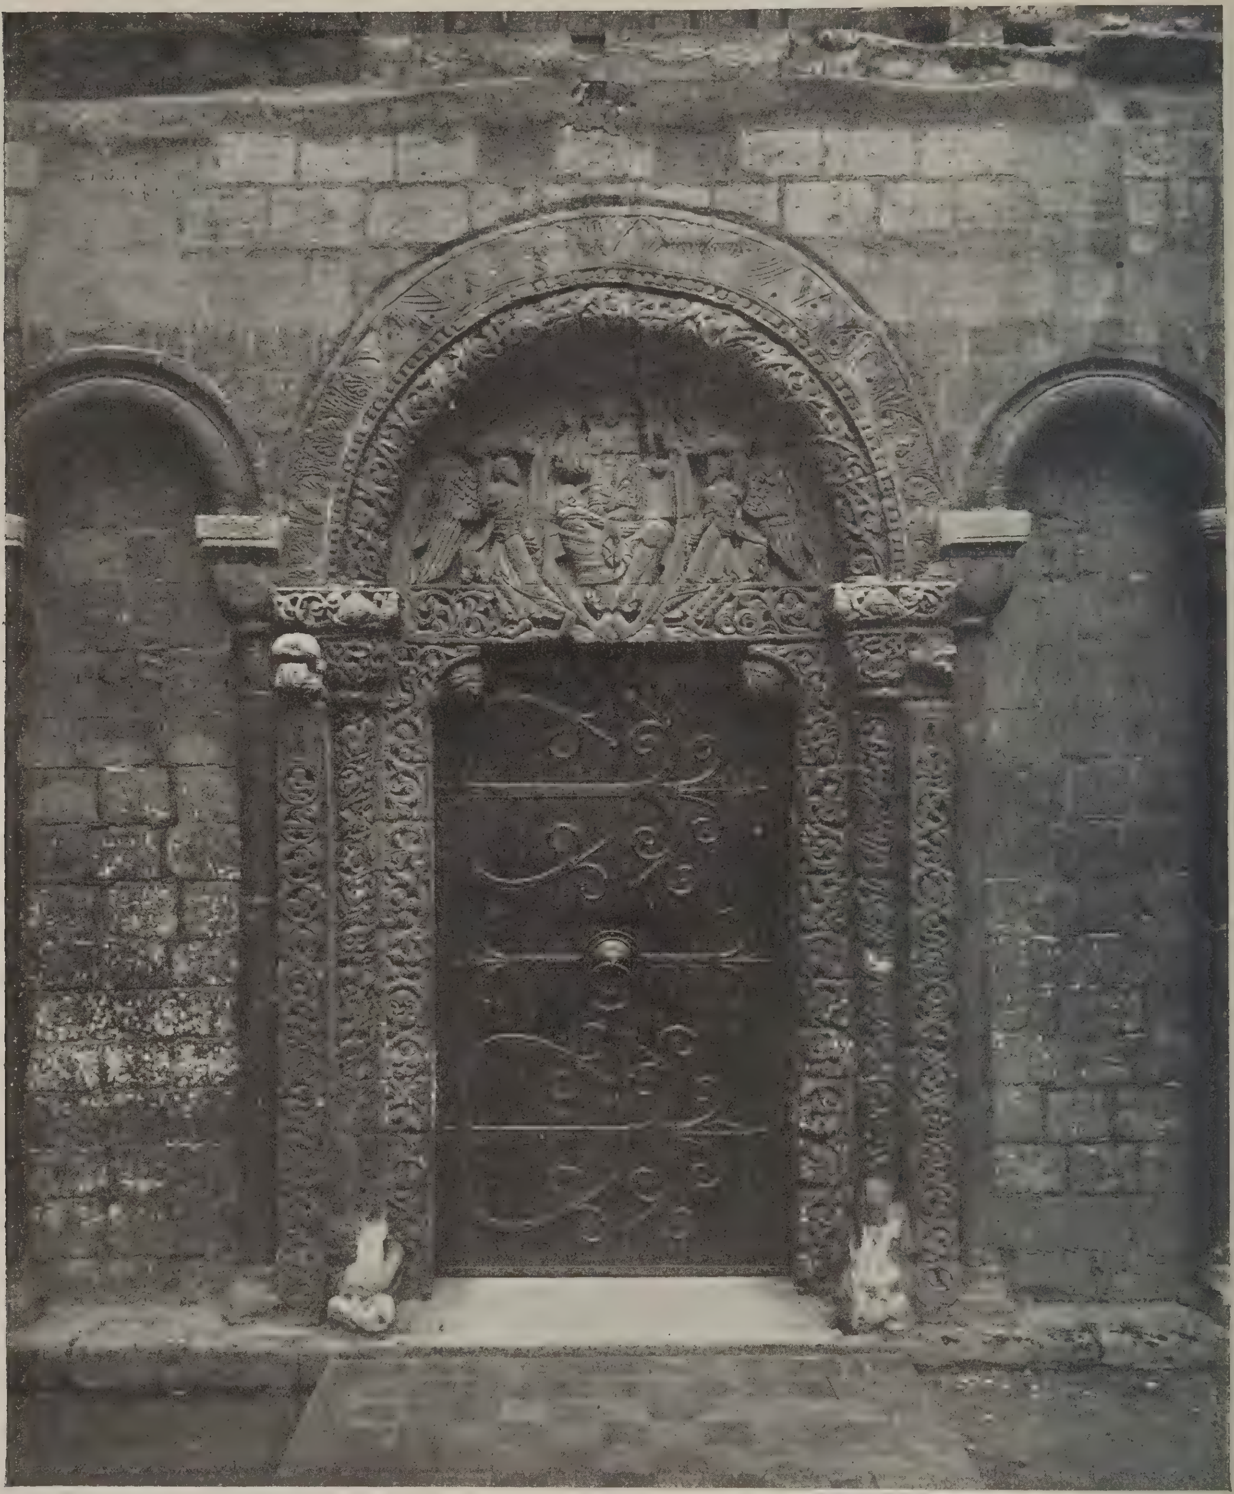
We have said that zinc oxide paints are superior in permanency and durability, under the best circumstances. These circumstances include the proper use of the material, and one of the important points in this proper use is the selection of a suitable drier. Zinc oxide is not of itself possessed of the siccative action of white lead, and for the driers that must be added some preparation of manganese is advisable, either manganese borate, manganese resinate, or manganese linoliate. The most useful proportion of these driers is one-half per cent., with which zinc oxide paint will dry in about eight hours; with less manganese, the rate of drying is considerably slower; with more it is not appreciably faster. On no account should patent driers or other lead compounds be added to zinc oxide.

It is, however, worthy of notice that the presence of a small quantity of lead, not exceeding four per cent., is an advantage to the quality of zinc oxide. This brings us to a consideration of the two principal methods of manufacturing zinc oxide, the "direct" and the "indirect." In the former the material is prepared "direct" from the ore, in the latter from the metal zinc, which has previously been extracted from the ore. Of the details of the manufacture we need not here dilate: they have been well explained in a paper read before the Paint and Varnish Society by Mr. Gaston Depierres (reported in *The Architect*, May 17, 1910), and issued amongst the Papers of the Society for 1909-1910. The important point for users of zinc oxide paint is that in the opinion of those well qualified to judge, the presence of a small quantity of lead salts, chiefly lead sulphate, is beneficial to the practical qualities of the paint and not deleterious to health.

Although the presence of a small amount of lead is not injurious, but beneficial, it must be remembered that this must arise during manufacture so as to ensure complete molecular distribution, which could not be obtained by the addition of lead salts to zinc oxide.

It appears that owing to the fact of zinc oxide having itself no siccative action on linseed oil, such as that possessed by white lead, it is advisable, though not absolutely necessary, to use a prepared drying oil in which the raw linseed oil has been treated under a moderate heat with one of the salts of manganese, the borate or the linoliate. Another reason for the use of a drying oil is that zinc oxide is ground with a much larger proportion of linseed oil than white lead. This fact also makes it desirable that for a flat coat part of the zinc oxide should be ground in turpentine instead of the whole being ground in oil.

Thus it will be seen that there are a number of points of practice in the use of zinc oxide which differ from



THE PRIOR'S DOOR.—ELY CATHEDRAL.

those prevalent with white lead, and these minutiæ must be understood by the painter who would give zinc oxide its proper chance. An excellent little book on "Zinc Oxide" by Mr. J. Cruickshank Smith has been published by The Trade Papers Publishing Co., Ltd., which gives much practical information on the subject.

Amongst the Papers of the Paint and Varnish Society for 1909-10, besides that on Zinc Oxide by Mr. Depierres, to which we have already referred, are included "The Methods of Painting on a Lime Surface," by Mr. W. Fourniss; "Colour Nomenclature," by Mr. J. W. Lovibond; "The Manufacture of Venetian Red and other Iron Pigments," by Mr. J. G. McIntosh; "The Action of Driers on Linseed Oil," by Mr. T. A. Davidson. Each of these papers when read was followed by an acute and expert discussion, and an evening was also devoted to the discussion of "The Advantages and Disadvantages of Washable Distempers," opened by Mr. J. Cruickshank Smith, and another to a demonstration of "Marbling and Graining," by Mr. W. J. Cloake. There is therefore in this little volume a wealth of practical and scientific information on paint and varnish given by expert workers and manufacturers.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

ALTHOUGH not very numerous, the drawings submitted for our August competition are of good quality, and our contributors have seized the opportunity which a pen-and-ink drawing allows of a compromise between the representation of a thing as it is, which is the function of an architect's diagram or geometrical drawing, and as it looks, which is the work of a photographer and, more or less, of a painter.

We purposely vary the subjects set monthly so that our students may combine the advantages of making measured drawings with those of freehand sketching. The latter teaches one to realise the effects produced, the former the means by which those effects are obtained. Both lessons are essential for the student of architecture.

"Doric" has sent a sketch of the reredos in the church of St. Michael le Belfry, York, an eighteenth century insertion in a sixteenth century church. The drawing is effective and at the same time clearly indicative of the detail of the subject.

Mr. T. Owen Thirtle has contributed two sketches, one of a staircase in Greyfriars Lodge, and the other also of a staircase at No. 10 Bedford Street, both in the city of Norwich and both of eighteenth century date. In each case Mr. Thirtle has given a general view of the staircase and a detail to large scale of the handrail, balusters, and string, which makes his work quite a useful study. In the Bedford Street example the second baluster on the tread should have been drawn so that the manner might be shown in which in this case, as in the other, the designer got over the difficulty occasioned by the cut string. We are glad to note that Mr. Thirtle is making steady improvement, but he must try to prevent his pen-and-ink drawing from becoming scratchy.

Mr. E. H. Gibson has again gone to Holy Trinity Church, Leeds, for his subject, and has sketched part of the sanctuary. His general sketch is a little too flippant in drawing, but a large scale detail of some enrichment makes amends by its greater thoroughness and care.

"Cot" has sent in a small outline perspective of a fireplace with oak panelling and mantel taken from an old house at Buntingford, Herts, and erected in the Hall i' th' Wood, Bolton. The author's drawing gives but a general idea of the work as it is and does not convey any impression of it as it looks. This Jacobean work is better left alone by the young student of architecture, as it tends to a deterioration of taste.

Mr. C. S. Carter has made a good drawing of a carved achievement of the royal arms of Anne, Queen of Britain, France, and Ireland, which is now in the Victoria and Albert Museum.

We have decided to award for the month of August prizes of half-a-guinea each to "Doric," Mr. T. Owen Thirtle, Mr. E. H. Gibson, and Mr. C. S. Carter.

NOTES AND COMMENTS.

The prospectus of the Faculty of Engineering at University College, London, gives particulars of some courses of instruction beyond those of the School of Architecture which would be useful for architectural students or young practising architects. First, an engineering class for architectural students deals with the properties and testing of materials of construction, with iron and steel construction in buildings and laboratory tests on building materials. The course is in two terms, the first, devoted to lectures, on Mondays at 4, Tuesdays at 5, and Thursdays at 4; whilst in the second term drawing office and laboratory work occupies the whole of each Monday. The fee for the class is £6 6*s*.

Then there is a course on heating and ventilating engineering, comprising lectures, laboratory instruction, experimental research and drawing office work. A tour in Germany to inspect important installations there will also be arranged. By passing through a three years' course a diploma in heating and ventilating engineering can be obtained. The College course in surveying and levelling appears particularly well arranged and thorough, and in addition there are a summer vacation surveying class, in which the whole time for three weeks is spent in carrying out a practical survey in the country, and a post-graduate lecture course in photographic surveying.

The School of Architecture at the College now adds to the certificate course and the B.A. degree course (honours in architecture), which have been in successful working for some years, a new course in academic design, which will be conducted mainly on the lines of the course in the Ecole des Beaux-Arts, Paris, under the supervision of Dr. J. J. Burnet, A.R.S.A. This is an interesting and novel departure in architectural education in England, and its results will be awaited with some amount of curiosity. The results of Beaux-Arts training in France are not altogether satisfactory, those in the United States are so. What shall we see in England?

In connection with the School of Architecture at University College there will be a course of ten lectures by Mr. Edward S. Prior, F.S.A., F.R.I.B.A., on English Mediæval Architecture, to which admission will be by tickets issued without fee. These lectures will be delivered on Thursday evenings at 6 P.M., and will be illustrated by lantern slides. An evening class in design, with Mr. Leonard Stokes and Mr. Edward Warren as special visitors, meets twice a week, and is open to all architectural students for the small fee of half-a-guinea. This practically free evening instruction, both lectures and class, is rendered possible by the generosity of the Worshipful Company of Carpenters.

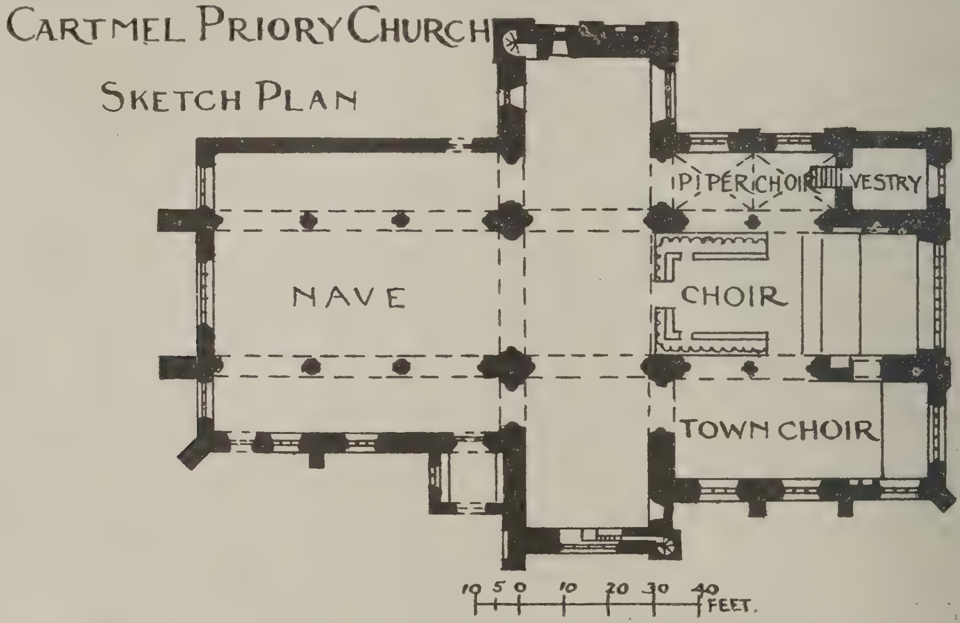
The cost of public buildings in future is likely to be somewhat increased by a circular issued by the Local Government Board to local authorities drawing attention to the recommendation of the Advisory Committee of representatives of Government Departments with reference to the fair wages clauses in contracts. The circular was as follows:—"Sir,—I am directed by the Local Government Board to draw the attention of the local authority to the accompanying memorandum embodying the resolution passed by the House of Commons on March 10, 1908, on the subject of fair wages clauses in Government contracts, and the recommendations made by the Advisory Committee of representatives of Government Departments which has been established as suggested in Paragraph 124 of the Report of the Fair Wages Committee of 1908 (Cd. 4422). It will be seen that the Advisory Committee recommend that clauses such as those inserted in Government contracts should also be introduced into contracts which are not entered into by Government Departments, but which involve the expenditure of public money or other consideration granted by a Government Department, or which require the approval of the Department. It appears to the Board that the policy adopted in the case of Government contracts should be followed in the cases of all contracts for the execution of works or the supply of materials which are entered into by local authorities or by, or on behalf of, any committee wholly, or in part, appointed by a local authority. Whilst they are aware that many local authorities specify in their contracts conditions to be observed by the contractor as to rates of wages and other matters affecting persons employed by him, the Board think that in every case the authority should give the matter careful consideration with the view to the introduction in the contracts of clauses on the lines of those inserted in Government contracts.—I am, Sir, your obedient servant, H. C. Monro (Secretary)."

We hope the local authorities will recognise that so-called "fair wages" mean increased expense, and will not sweat architects' brains in a vain endeavour to get a sovereign's worth of building for ten shillings. "Fair wages" do not benefit the workman in the long run. The town hall costs more, the rates go up, and the ratepayer charges the workman more for his rent and more for his food and clothing. The only real effect is to lessen the value of money. A workman never gets more than the value of his work whether he receives the Scriptural penny or the Yankee five dollars for his day's work. The people who suffer are those whose income is fixed to a definite number of pounds per annum.

This month's number of the *Art Journal* now deals with Boughton in its series of articles on interiors of English mansions by M. Jourdain, and several fine illustrations of furniture and interior decoration are included. Internal decoration is further concerned with an article on "Gilt Leather Rooms" by Francis Lenygon, with which are two coloured plates as well as black and white illustrations of sumptuous examples. The series of articles on "Tapestry Weaving in England" by W. G. Thomson now describes, with illustrations, the seventeenth century productions of the Mortlake manufactory, as to which the author is enthusiastic.

Amongst the interesting articles in this month's *Connoisseur* is a description of the collection of miscellaneous pieces of old furniture formed by Sir Frederic Cowen, illustrations of some of the most remarkable of which are given. The series of articles on "Lace" by Bernhard and Ellen M. Whishaw now describes Punto de Aguja and Point d'Espagne. The Salting collection forms the subject of another article, the second part of a series, and metal work, ivories and pottery are the classes of objects of art illustrated in this instalment.

Councillor Johnston, of the Newcastle City Council, seems to have peculiar ideas as to "fair wages" for architects, but perhaps the "President of the National Association of Architects" (when found) may enlighten his ignorance and point out the weaknesses of the following resolution, of which the worthy Councillor has given notice:—"That this Council advertise and offer for open competition three prizes of £50, £30, and £20 respectively, for plans for the laying out of 200 acres of the Walker Estate upon model cottage lines. Competitors to forward to the Town Clerk a ground plan showing situation of cottages and land for open spaces and public buildings, also four sets of plans showing four different types of cottages on the self-contained principle in semi-detached or other styles; cottages to have three, four, five and six rooms, with bath; the plans to show amount of garden space allotted to each type of cottage; minimum number of cottages per acre to be not less than 12, and maximum not to exceed 15. That the President of the National Association of Architects be asked to appoint two members of his Association who with himself shall judge the plans and award the prizes, the selected plans to become the property of the Council."



Apropos of the ventilation of churches, a criticism has been put forward that the beautiful Lady chapel of Liverpool Cathedral has no window made to open, so that there is a fear that "mal de l'église" may be experienced here as in so many mediæval churches and also modern ones, where nowadays the conditions of worship are so entirely different from the past. A church that is filled with a congregation for an hour or two requires more fresh air than one in which only a few are gathered at a time, and these for a comparatively short period.

A wonderful tale comes from America of a Welshman who emigrated to Chicago and imbibed the national ability for hustle, which he demonstrated by building a house complete in a couple of days. The house consists of two rooms large enough for one or two persons to live in. The outside dimensions measure 12 ft. by 20 ft., and the rooms, 11 ft. by 9 ft. and 8½ ft. by 9 ft. respectively, the ceilings being 8 ft. 6 in. in the clear. The floors are tiled in ornamental pattern; the walls plastered two coats with hard finish, and the larger of the two rooms has a plastered ceiling with hard finish. The roof was covered with green glazed Spanish tiles, with hip rolls and cresting. There were electric lights on the ceiling, a convenient telephone, and an enamelled steel closet inserted in one of the walls. The outer walls were coated with a quick-setting plaster, covered with pebble dash made of white Portland cement, sand, and pea gravel.

The enterprising owner got possession of the site on a Wednesday at 8 A.M., but meanwhile all the materials for completing the house were on carts waiting on the road outside. Then the procession commenced, and everything had been wheeled into the site by 12 noon. The tile-layers commenced at 12.30 P.M., and two relays of men had the walls up by 11 P.M. of the same day. Work was resumed at 8 A.M. on Thursday, the 27th, and the tile roof was finished by 9 P.M. on the same day. By the time the roof was finished, the whole interior had been plastered and trimmed, and the outside covered with pebble dash stucco. Only the painting of the woodwork was done on the Friday, April 28, and the garden was laid out and planted the same day.

The moral of the tale is the fact that everything was ready at the time possession was taken of the site, and this is the secret of rapidity in building, whether it be a two-roomed cottage or a £100,000 opera-house.

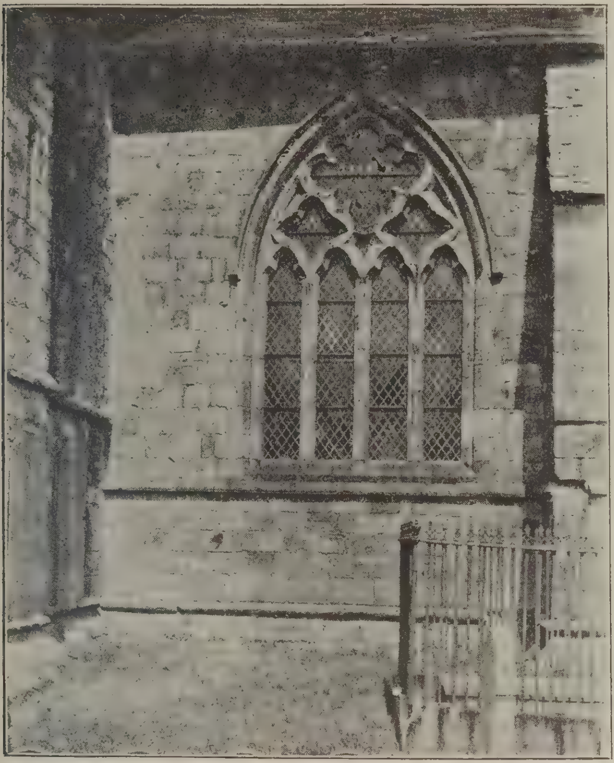
THE PRIORY CHURCH, CARTMEL.

By Professor Charles Gourlay, B.Sc., A.R.I.B.A.

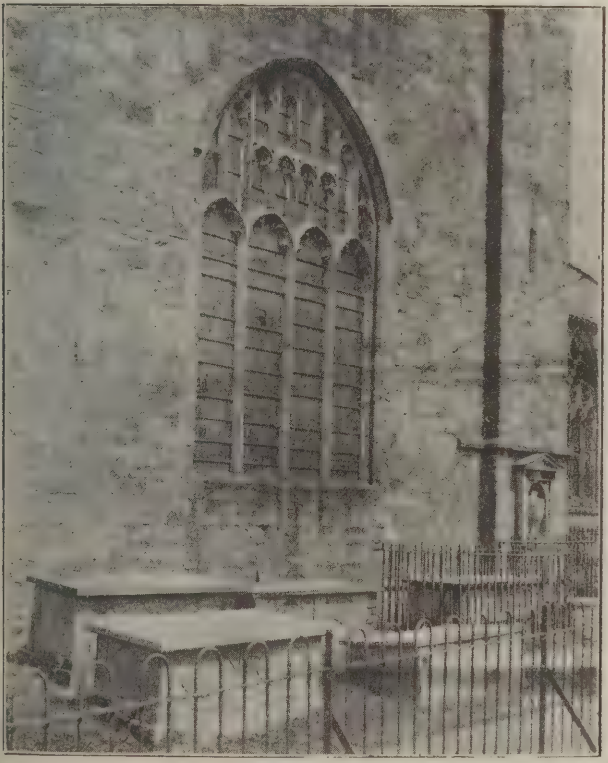
THE small town of Cartmel in Lancashire possesses a magnificent church, dedicated to St. Mary, charmingly situated in a valley fully two miles from the town of Grange-over-Sands.

The church is cruciform in plan, the nave has central and side aisles, the choir has chapels in place of aisles, but the north and south transepts are without aisles.

The present building dates from 1188 when William Marshall, afterwards Earl of Pembroke, founded a Priory of Canons Regular of St. Augustine at Cartmel, and work of this early period is visible in the arcading on each side of the choir, which has round arches, the capitals being carved with Transitional Norman foliage and having square-edged abaci. The four arched openings from the transepts into the nave aisles and choir chapels are, however, pointed, although the detail generally is Transitional. The choir arch over the eastern piers at the crossing is evidently a later addition, as its orders do not correspond with the section of the piers upon which it stands.

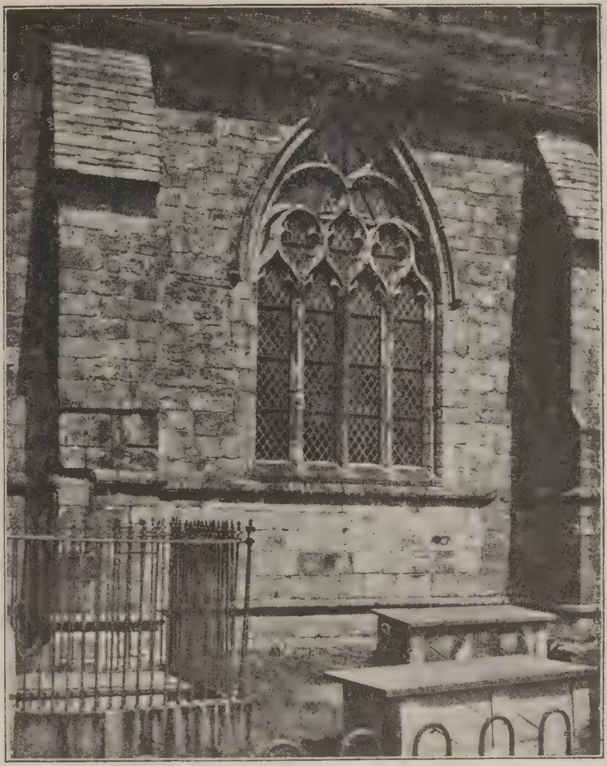


WINDOW OF SOUTH CHAPEL OF CHOIR.



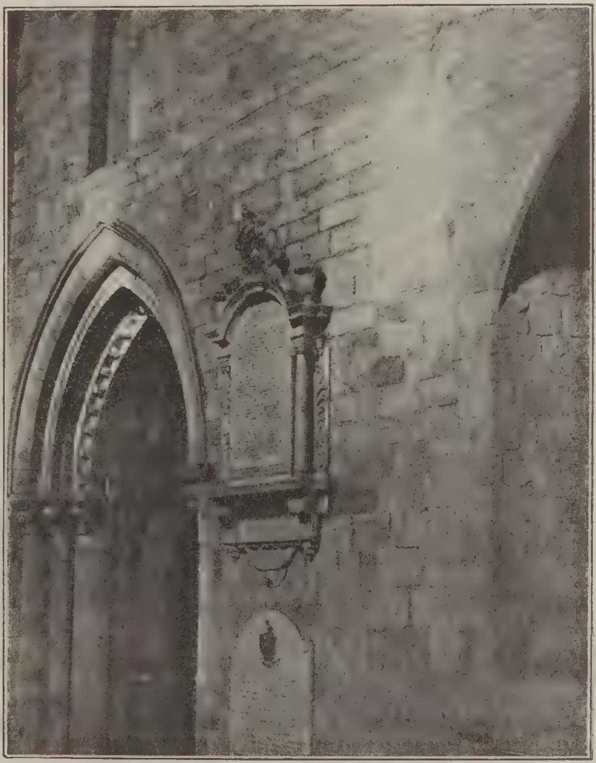
WINDOW OF SOUTH TRANSEPT.

The actual building of the transepts and the four piers of the crossing also belongs to this early period, but the round or pointed headed windows have nearly all been replaced by perpendicular ones. The old north wall of the nave contains an Early English doorway, which led from the cloisters into the nave. The principal entrance to the church at the present time is the Transitional doorway leading into the south aisle of the nave, which has a post-Reformation porch next to the west wall of the south transept.



WINDOW OF SOUTH CHAPEL OF CHOIR.

The triforium of the choir consists of a simple pointed arcade extending its entire length. This arcade has been built up at two parts with the object of strengthening the wall, this probably having been done when the later clerestory was built. The clerestory is perpendicular, and



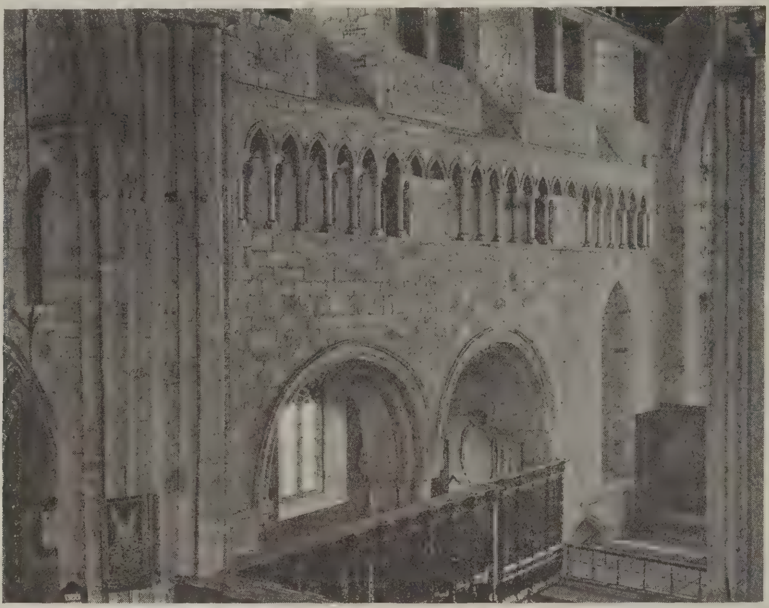
INTERIOR OF EAST WALL OF SOUTH TRANSEPT, SHOWING RAWLINSON MONUMENT.

the whole height of its windows is not seen from the interior of the choir. The segmental arched soffit of each window cuts off the tracery, which is seen only from the exterior of the church.

The east window is of nine lights, dates from about 1400, and is most beautiful both in design and detail. It is 54 feet high by 24 feet wide, is made of Caen stone, and is a fine example of perpendicular tracery. The sedilia on the south side of the presbytery is Early English work but has been broken through, only about two seats now remaining, when the Decorated monument known as the Harrington tomb was placed in position. The base of this monument dates from about 1300 and the upper part from about 1350. Its carving, though much mutilated, is of singular beauty.

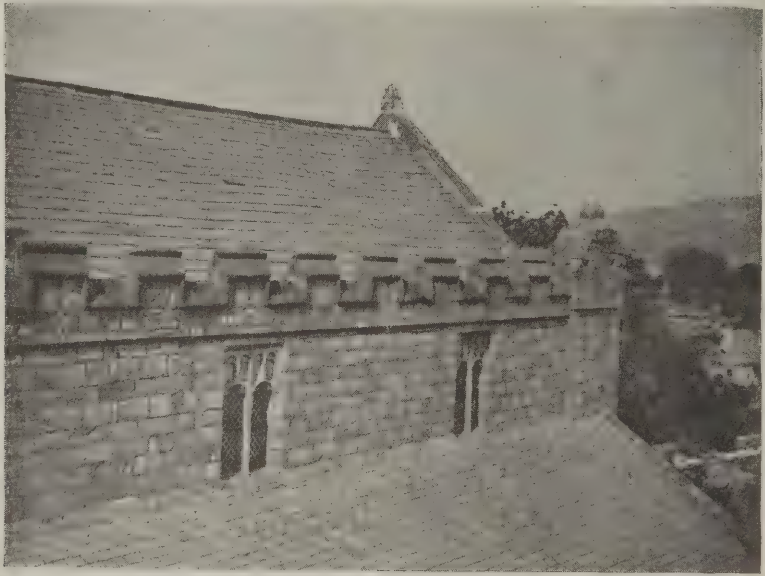
The entire church is roofed with timber, which shows internally, except the north choir chapel, known as the "Piper Choir," which is vaulted with stone. This chapel is, in length, equal to two of the three bays of which the choir is composed. To the eastern end of this chapel the vestry was added in 1678.

On the south side of the choir there was a chapel of the same size as the Piper choir, and remains of shafts and springer-stones still in position show that it had been vaulted. In the Decorated period (about 1350), however, this chapel was enlarged to form the "Town Choir," or parish church. It contains a piscina and two sedilia, also three three-light windows in the south wall which are of excellent design and detail, the tracery being different in each. The east window of this chapel is of five lights, and is a perfect example of the transition from the Decorated to the Perpendicular periods. When the dissolution of the priory took place in 1537 this chapel was the only portion left with its roof untouched, all the other portions of the church roofs being stripped of their lead covering and left to decay, until in 1618 Mr. George Preston commenced the work of restoration by re-roofing the chancel and nave.



NORTH SIDE OF CHOIR.

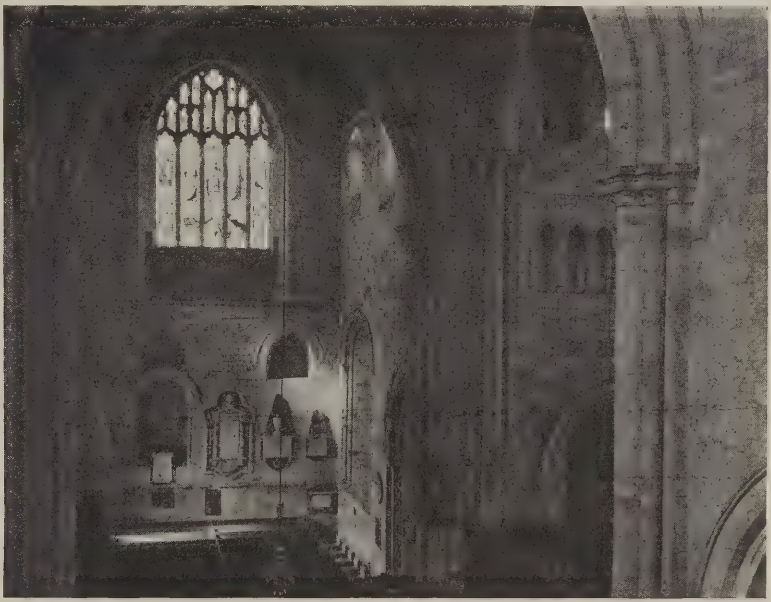
The north transept has a four-light perpendicular window in its east wall, which has obviously been formed internally by taking away the stonework between two lancet windows and throwing them both into one, the arch-stones being re-used to make the elliptically formed soffit seen internally, the remaining jambs of the lancet windows still serving as jambs to the enlarged opening. Well-designed Perpendicular windows have replaced the Early English ones at the ends of both transepts, and in fact the whole eastern arm of this church is an example of how the later men, desiring more light into the church, destroyed Early English windows and substituted enlarged ones in the style then current.



EXTERIOR OF CLERESTORY, SOUTH SIDE OF CHOIR.

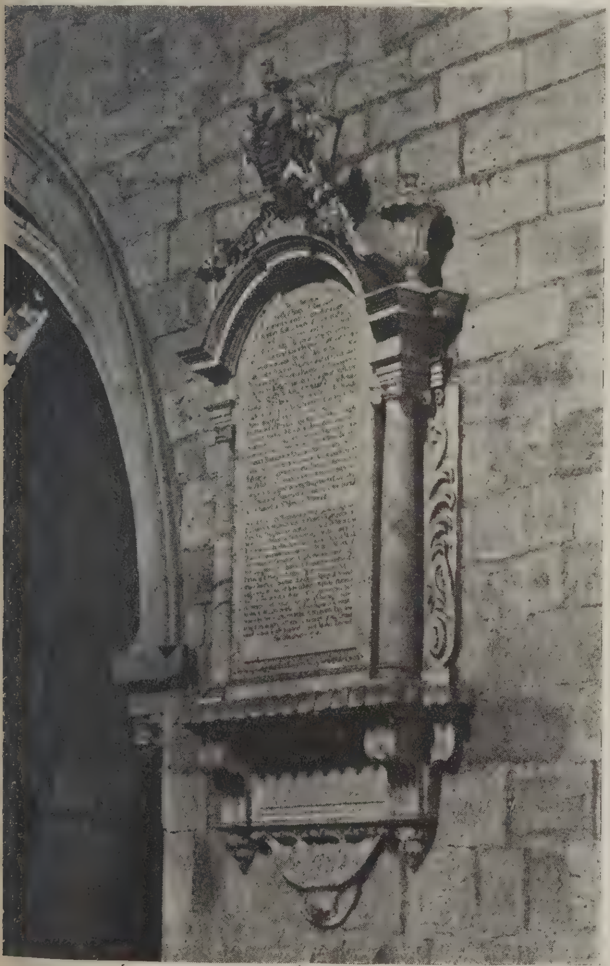
On the east wall of the south transept there is the Rawlinson monument, which was erected in 1706. This monument being both perfect in scale and excellent in detail is an example which shows how beautiful a wall monument of this nature may be.

The cloister appears originally to have been placed to the south of the church, the blocked-up door in the end of the south transept having probably led to the dormitory, while there is a recess in the exterior of the west wall of this transept which may have been a book-cupboard.



INTERIOR OF NORTH TRANSEPT.

About the year 1400 the Transitional nave, except the outer wall of its north aisle, was pulled down and the present nave erected. The nave is short, being only three bays in length, the pillars of the arcading are octagonal on plan and have simply moulded capitals and bases, the arch-mould is in three orders but these are only chamfered on edge and there is no hood-moulding. There is no triforium, but evidence that the Transitional nave had a triforium exists in the fact that similar openings to those which at present admit light to the triforia of the choir from the transepts still remain, though now blocked up, on the west side of the transepts. The nave clerestory contains two two-light windows. All the nave windows are of good Perpendicular design and the small doorway at the south-west corner of the nave still retains its fifteenth century oak door, which is of great interest.



THE RAWLINSON MONUMENT.

The original tower at the intersection of nave, choir, and transepts did not rise much higher than the ridges of the adjoining roofs, but about the year 1400 large arches were sprung from the centre of the sides of the square, and upon these an additional tower was placed to serve the purpose of a belfry. This arrangement of a square placed diagonally upon another square is unique, and though a peculiar design, is not unsatisfactory, while the detail of the belfry windows, which are fitted with green slate louvres, is very good. There is an embattled parapet all round the clerestory and transept walls, round the gable of south transept, the west but not the east gable of the church, also round the tower and the belfry.

When one considers that the roof was off the choir for more than eighty years it is remarkable to find that the twenty-six old mediæval wooden stalls, with their misereres dating from about 1450, are still in position. The bench-ends show evidence of having been exposed to the weather, but the seats have evidently been protected by being covered up probably with rubbish. About 1618-20 the present early Renaissance oak canopies, having pierced tracery backs, were placed upon the old stalls. The pierced tracery panels in the screen across entrance to choir are made in two heights so as to be opened during service, the upper parts being hung with modern brass edge hinges, while the lower have old hinges made of iron. These canopies are very richly carved with the vine spirally disposed and combined with the emblems of the Passion, and are in an excellent state of preservation.

The modern restoration of the church began about 1830 and continued more or less steadily till about 1870, when it was completed in a general way, although some parts still require attention.

The modern monument at the west end of the north aisle of the nave is composed of Devon and Derbyshire marbles resting on a base of Furness limestone, and is an excellent example of the use of these beautiful materials. The monument is to the memory of Lord Frederick Cavendish, and was designed by Messrs. Austin & Paley, the figure being by Mr. Woolner, R.A. It was erected in 1885.

Although the church contains good work belonging to all the periods of English Gothic, for its building has extended over the whole range of the mediæval styles in England, yet its design is most dignified externally and internally. The exterior is, if anything, rather severe in its aspect and its interior is rather cold and colourless, largely owing to its lack of stained glass. Its proportions are, however, admirable, its detail is beautiful, and the entire church is well worthy of being carefully studied by architectural students, who will find a complete set of plans and other drawings of the building in the John o' Gaunt Sketch Book, vol. ii., 1876-9.

THE ART OF THE THEATRE.

The spirit of the times must no doubt be more or less faithfully reflected by a stage whose *raison d'être* is to give its patrons what they want. However, that reflection may become a little distorted in course of time. Competition for patronage gives rise to an exaggeration of those wants in the minds of over-zealous servants who not only participate but also create them. This particularly applies to the presentation of Shakespeare's plays. It seems inevitable now that Shakespeare should be staged in the West End of London with the utmost elaboration, and in a fashion which in at least some respects will be held to have eclipsed all previous presentations. Hence there has been a sort of crescendo which is gradually beginning to overpower the mere written play and make it of secondary account. If success be gauged by box-office receipts alone then this method must be accepted without demur. Theatres are, we all know, run to make money, and the only way of accomplishing that is to attract the public. The surest way to attract the public is to give them what they wish to see and are willing to pay to see. Precedent would, therefore, seem the safest guide; and the best motto to be, "the same kind of thing as before, only a little more so." But there ought to be more than one road to financial success if an adventurous pioneer can only find it. And along that road the producer will surely shed his unessentials, his superfluities, one by one. It will need courage to abandon the smooth-trod tracks of established success in order to follow the little known mountain-path of experiment. It would appear as if at least one actor-manager was recently daunted at the prospect of leaving the fertile valleys, for in his latest production he has surpassed his own high record for opulence.

At the Leicester Galleries there has just opened an exhibition of drawings and models for "Macbeth" and other plays by Mr. Edward Gordon Craig, whose name is better known in this country than his work. On the Continent Mr. Craig has gained a considerable reputation for his work in scenic effect and stage arrangements—in proof of which we may mention that he is producing "Hamlet" in November at the Théâtre Artistique of Moscow. In London he has only been connected with some three productions. These "Macbeth" drawings and models were made at Sir Herbert Tree's request for the production at His Majesty's Theatre. The brief foreword to the catalogue in discreetly referring to this fact adds "my only regret is that I found it necessary to withdraw them." It may be presumed that Sir H. Tree wished to curb or soften down Mr. Craig's individuality.

There is no denying that all the drawings show individuality of an almost bewildering kind. Mr. Craig claims to have thought of Shakespeare first and of the actor or actress second. This is just as it should be. Yet it may be humbly wondered if "Mr. Craig" did not come before the actor or even before Shakespeare. None of the drawings are really more than studies, and many of them represent the jotting-down of a momentary idea. All this inevitably tends to illustrate Mr. Craig rather than to illustrate the poet, for it is well-nigh impossible to construct a sentence out of a half-spoken word. Possibly to an actor-manager these sketches may be in the nature of a cable code and convey more than they do to an outsider who lacks the key. Each of the exhibits seems to indicate something personal.

Perhaps Mr. Craig spurns archæology and claims to design his stage-setting with little or no regard for historical correctness. He might defend that attitude by pointing out the poet's own anachronisms. Macbeth's castle figures in most of the drawings; but the like of it was never seen at Inverness during Duncan's reign or at any other period. It is a castle and nothing but a castle, so let that suffice. The first picture (and there is also a model) shows the fateful Duncan with his sons and attendants toiling up the precipitous path to the castle gates at which stands Lady Macbeth. It is evidently the outer gateway in a lofty curtain wall, fortified by a curious perspective of great square towers at close intervals. One possible objection is thus forestalled by a characteristic note in the catalogue: "The obvious thing that the London critic may say is that you cannot get such a height on the actual stage, and the surprising answer is that you cannot—in London. Somehow or other, a sense of space is a thing seldom attempted by anyone in London. . . . In some of the theatres on the Continent they have got past this difficulty, and yet without robbing the actor, the stage manager, and the call-boy of their employments." The wall certainly shows no "jutty, frieze, buttress, nor coign of vantage" on which Banquo noted the temple-haunting martlets. The setting is admittedly most effective; but Act I., Scene 6, lasts only a few minutes, and producers of Shakespeare must be allowed to think of the profit and loss account. Many of the interior scenes show an equal delight in the grand manner constructionally and an equal disregard of the aids to magnificence which no wimpress the audience and win a preliminary round of applause for the scene-painter.

It has been suggested above that the drawings may puzzle the uninitiated. To such people the collection of five or six models will come as a relief. By a clever manipulation of lighting their stage effect is strikingly indicated. It is not our place to question whether they are all practicable. Mr. Craig no doubt believes them to be, and he is a man of practical experience. As Sir H. Beerbohm Tree did not use them for his latest production it would seem as if he did not, although it is more than possible he may consciously or unconsciously have been influenced afterwards by their inspection. One of them shows Act I., Scene 1, "A Desert Place." Conspicuous here is the solitary square monolith in red granite towering above the three witches standing at its rocky foot. This would unquestionably rivet the minds of the audience and dispense with the necessity for aerial witches and other distracting tricks. It is open to doubt whether there is justification for laying Act I., Scene 5, in Lady Macbeth's bedroom. She would scarcely retire there in order to read a letter, nor would she be followed thither by one of the men-servants. In the interior views of the castle Mr. Craig conveys a feeling of huge strength and massiveness which is increased by the absence of any architectural ornament. The walls are generally of great height and very plain, while the doors are high, square openings. In one model—it is of the "Murder Scene"—the arrangement is extremely clever. In fact, that remark applies to almost everything that Mr. Craig shows. Sometimes even it might be wished that he had been a little more ordinary.

The exhibition in the Reynolds Room of the Leicester Galleries contains drawings for several plays besides "Macbeth," but it is on these latter that the most interest fastens.

ILLUSTRATIONS.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

This week we have the pleasure of reproducing some of the sketches made on the A.A. excursion last month by Mr. Charles E. Bateman, F.R.I.B.A., President of the Birmingham Architectural Association.

CATHEDRAL SERIES—ELY.—LADY CHAPEL LOOKING EASTWARDS—ARCADING IN LADY CHAPEL.

With these views of the interior of the beautiful Lady chapel we bring to a close our supplementary series of views of Ely Cathedral.

The Tranent School Board (N.B.) recently invited plans and estimates for a school proposed to be erected on the Ormiston Road, Tranent. There were six sets of plans, and after consideration the award has been given to Mr. Peter Whitecross, architect, Prestonpans. The cost is estimated at £5,000. It is understood the work will not be commenced for from six months to a year.

An ordinary meeting of the Council of the Royal Institute of the Architects of Ireland was held on the 4th inst. at 31 South Frederick Street, Dublin. Mr. W. Kaye-Parry, F.R.I.B.A., occupied the chair, and there were also present Messrs. F. Hayes, H. Allberry, A. G. C. Millar, F. G. Hicks, G. P. Sheridan, Lucius O'Callaghan, G. C. Ashlin, and C. A. Owen, Hon. Secretary. The minutes of the ordinary meeting of June 12 and of the special meeting of July 26 were read and signed, and a large amount of correspondence dealt with, including applications for admission to studentship. A report from the Professional Practice Committee in reference to a proposed revision of the schedule of charges was approved and adopted. A vote of condolence with the family of the late Mr. W. H. Hill, of Cork, was passed.

THE AGE OF STONE CIRCLES.

Report to the British Association of the Committee, consisting of Dr. C. H. Read (Chairman), Mr. H. Balfour (Secretary), Lord Avebury, Professor W. Ridgeway, Dr. J. G. Garson, Sir A. J. Evans, Dr. R. Munro, Professor Boyd Dawkins, and Mr. A. L. Lewis, appointed to conduct Explorations with the object of ascertaining the Age of Stone Circles. (Drawn up by the Secretary.)

Excavations were renewed at Avebury Stone Circle in the spring of the present year, and, as in former years, Mr. H. St. G. Gray, Curator of the Taunton Museum, was placed in charge of the work, to conduct the excavations under the general directions of the Committee. In selecting the particular sites most likely to yield important results, the Committee were impressed with the great desirability of conducting excavations in the *fosse* to the east of the causeway, on the opposite side of which cuttings had been made in the fosse in previous years. The owner of this portion of the circle, Captain Jenner, readily gave his permission, but, unfortunately, the strenuous opposition of the occupying tenant caused this scheme to fall through. It is most desirable that thorough exploration of the fosse and causeway should be made at this point, but for the present the matter must remain in abeyance, and this important part of the examination of the earthwork must be postponed, perhaps, for a few years. In consequence of this primary scheme having been rendered abortive, the Committee agreed to extend further the exploration of the S.W. portion of the fosse, and to this the season's work was practically confined. The results obtained have borne out the views based upon the previous excavations, and have strengthened the belief that the monument dates from Neolithic (probably late Neolithic) times. The work has been conducted by Mr. Gray in a very thorough manner, and the records, plans, and photographs form a very complete series of permanent value. Mr. Gray's detailed report is appended, giving a full account of the work done and of the relics found. A detailed statement of accounts of receipts and expenditure is also forwarded. The thanks of the Committee are due to those who have generously responded to an appeal for subscriptions to eke out the grant made by the British Association, the amount collected (a detailed statement of which is appended to the report) being very satisfactory. The Committee wish also to thank Lord Avebury and Captain L. C. D. Jenner for permission to excavate on their property, and the Rev. J. G. Ward, Vicar of Avebury, for assistance rendered in procuring labourers. Captain Jenner also assisted the work by the useful loan of a number of planks, &c.

Although it is unlikely that excavations at Avebury can be renewed next year, the Committee ask to be re-appointed with a view to a complete survey of the Avebury circle and earthworks being made by Mr. Gray, who has already prepared a survey-plan of the S. and S.W. portion. For this it is hoped that a grant of £20 will be made by the Association. This will not cover the expenses, but it is hoped that the sum may be slightly augmented by subscriptions. No perfectly reliable plan of this most important monument exists at present. The balance of the fund collected being allocated by the subscribers to special excavation work for the examination of the *vallum* and the "cove," will not be available for the survey.

The Avebury Excavations, 1911. By H. St. George Gray.

I. *Introductory Remarks.*

Having given a general description of Avebury and its surroundings in the former reports, the present account will be almost confined to the excavations conducted at Avebury from Monday, April 24, till Wednesday, May 10 (the filling-in continuing till Saturday, May 20). It should be stated that all the cuttings so far made are situated on Lord Avebury's property. Not only were the 1911 excavations filled-in this season, but similar work was completed in regard to the explorations of 1908 and 1909. Fencing now encloses these areas, so that in the course of a couple of years nearly all traces of the excavations should be obliterated.

A maximum number of fifteen men was employed this season, sixteen being engaged in 1909, and eleven in 1908. The weather was fairly favourable, not more than eight hours being lost on account of rain during the period of the work. This season we took the necessary precautions, and were not hindered by falls from the sides of the silting as the digging penetrated into the lower strata of the great fosse.

Sectional diagrams of the fosse, &c., were made as the work proceeded, in which the deposits of silting were indicated, as well as the position of every object of importance found. The scale map of the area excavated in 1908 and 1909 has been redrawn to include this season's work. An average section of the southern fosse was given in the 1908 Report (p. 406), and, being fairly representative of the other sections, it will be unnecessary to publish another on the present occasion.

Twenty satisfactory photographs (half-plate) were taken during the season, and these, added to the twenty-two taken in 1909, and sixteen in 1908, not only show the progress and chief featlres of the excavations, but also include general views, together forming a somewhat complete photographic survey of "the Temple" of Avebury.

One of the most interesting features of the 1909 excavations was the discovery of the entrance-causeway of solid chalk, a little to the east of the modern road into Avebury from the south, connecting the Kennet Avenue with the interior of the monument. The causeway proved to be about 24 feet wide, and on its east margin we dug some test trenches and found that the solid chalk gradually receded as if sloping off to meet the upper margin of the walls of the fosse in the form of rough steps, not always well defined.

With these results before them the members of the Committee were anxious to follow up these observations and to excavate the rounded (or squared?) end of the fosse at its termination on the east side of the causeway; and it was felt that being close to the entrance there would be an increased probability of finding a larger number of relics in the silting of the fosse in this position. The silting is not high here, and probably has at no time been under cultivation, so that the labour entailed in re-excavating this part would be proportionately less than in the fosse on the south and south-west of the monument. As stated elsewhere, although Captain Jenner (the owner) was willing that this work should be done, his tenant was found to be bitterly opposed to excavations being carried out under any conditions. Fortunately for archæological field-work, such obstacles do not often present themselves. The disappointment, however, had to be faced, and, pending further negotiations, it was decided that an excavation should be made across the S.W. fosse, on Lord Avebury's property, of greater extent than those made in former years.

II. *General Observations on Cutting VIII., through the S.W. Fosse*, 1911.

This cutting was 30 feet long, and was afterwards extended in the middle 6 feet further west in order that a ledge, or bench, might be cut, upon which the lower strata of silting could be thrown in clearing the bottom of the fosse. The eastern margin of the cutting (in the middle of the silting) was 235 feet in a direct line from the gateway on the western side of the road at the Kennet Avenue entrance, and 98 feet from the middle of the western margin of Cutting I. (1908) across the fosse.

The surface of the silting at the point selected for this year's work was practically level (the variation being less than six inches). It is stated, on the authority of the oldest inhabitants of Avebury, that the whole of the S.W. quarter of the fosse had been cultivated as arable land some sixty years ago, and this would account for the flatness here. As previously stated, it is said by the local people that a quantity of loamy tenacious material had been brought to this part of the fosse, and especially near the high-road from the site of the new bridge across the Kennet stream on the Devizes road.

While the excavations were in progress a large sectional diagram was plotted along the eastern margin of Cutting VIII. Fosse, and continued in a S.W. direction to include the crest of the vallum, the foot of the exterior slope, and the boundary-hedge beyond, and in a N.E. direction to cover the turf-clad counterscarp of the fosse and part of the central plateau, including one of the standing sarsen stones (height 8.5 feet) of the great outer circle. The horizontal distance from the north side of the stone to the north upper margin of the boundary-hedge proved to be 183 feet, and from the middle of the fosse to the crest of the vallum about 78 feet.

This section showed that the central plateau was 12 feet, and the crest of the vallum 31 feet, above the turf level of the fosse. After re-excavating the fosse the bottom was found to be 18.7 feet deep below the surface of the silting on the eastern margin, and consequently 49.7 feet below the crest of the vallum. Supposing that the crest of the vallum was originally about 5 feet higher, the total vertical height from the floor of the fosse to the summit of the embankment could not have been less than 55 feet—probably the largest dimension of the sort obtainable in any prehistoric earthwork in Britain.

Along the line of section on the eastern margin of the cutting a narrow trench (3 feet wide) was dug from the south side of the cutting towards the crest of the vallum, to ascertain the position of the hewn chalk. It was found to run at an angle of 28 degrees for a considerable distance, at a depth of from 1.1 to 1.6 feet below the surface of the turf. This digging was carried far enough to find clear traces of the old turf line under the great vallum, and to reach the solid chalk at a depth of about 2.2 feet below its surface. From this trench and the level of the central plateau, we were able to obtain a fairly accurate estimate of the *original* depth of the fosse, in this part, that is, its depth below the ground level at the time of the construction of Avebury. This estimate gives the depth of 31.5 feet for the fosse in the middle, and a height of about 16 feet for the vallum above the old surface line at the present time; but the original height of the embankment, as previously stated, was undoubtedly greater.

At the close of the excavations we found that on the line of section both the escarp and the counterscarp of the fosse, revealed by the removal of all the silting, had faces inclined at different angles. The following was the inclination of the solid chalk sides:—

Escarp.—Lower 5 feet, inclination 90 degrees; middle 18 feet, 62 degrees; upper part, 28 degrees.

Counterscarp.—Lower 8 feet, inclination 74 degrees; middle 12 feet, 50 degrees; upper part, 28 degrees.

III. *The Excavation of Cutting VIII., Fosse.*

A length of 30 feet of fosse was excavated, but as a considerable batter to the faces of the silting had to be left to avoid any risk of falls, it was only possible to uncover completely a length of 21.5 feet of the floor. Unlike the floor in the former cutting, the bottom was found to be very irregular and far from level. The fosse was deepest along the eastern margin—namely, 18.7 feet below the surface of the silting. It gradually rose as we continued the work of re-excavation westward. The depths of the fosse below the surface of the silting along the western margin of the cutting were*: Maximum, 16.8 feet; minimum (in the south corner), 15.3 feet; in the middle of the fosse, 16.3 feet. The maximum width of the bottom of the fosse was 15 feet at the east end, and the minimum width in the middle about 9.5 feet.

Two sectional diagrams of the floor were made, showing that the levels taken varied to the extent of 2.95 feet, which was very surprising. This may probably be accounted for by the poor quality of the rock, which consisted of a soft, smooth, rotten, pale greenish-grey chalk of the zone of *Rhynchonella Cuvieri.* (The common fossil, *R. Cuvieri*, was found close to the floor.) This poor chalk occurred also in the lowest part of the profile of the fosse, with occasional solid blocks of whiter chalk projecting beyond it, as seen in some of the photographs.

(*To be continued.*)

THE DEVELOPMENT OF BUILDING LAND.†

By John James Done (Fellow).

THE question of the development of building land is one that at the present time occupies a considerable share of public attention. The Finance (1909-10) Act, 1910, and the Housing and Town Planning Act, are the Parliamentary expressions of that public interest.

So far the development of our large towns has been almost entirely the work of individual enterprise, and if the results leave much to be desired, it is a matter of some doubt whether improved methods in one direction will not be dearly purchased by material disadvantages in other directions.

It is not proposed in this paper to deal with the larger question of town planning, which has already been adequately dealt with in this room. There are, however, a number of points in connection with the practical management of building estates which are of interest to members of this institution.

It rarely happens that a surveyor has an opportunity of laying out a new town. It may happen in the case of a seaside resort such as Eastbourne or a "garden city" such as Letchworth.

In such cases the designer has a free hand, and it is possible to produce conditions which are more or less based on the ideal; but the vast majority of towns are much more the products of economical necessities than of aspirations after the ideal. Moreover, a doubt may be permitted as to whether the ideal town is always and necessarily so much superior to the town that has developed on what may be called spontaneous lines. This was impressed on me after spending a week in the deadly monotony of Philadelphia with its broad streets and blocks of buildings laid out in quarter-mile squares, almost like a chess-board, and then proceeding to Providence, Rhode Island, in which the irregular and winding streets had a charm that was certainly lacking in Philadelphia.

When the question is on the largest scale, *i.e.*, when an entirely new town is being planned, many points have to be dealt with that do not arise when a smaller block of suburban land is concerned. Open spaces, parks, and pleasure grounds may be allocated, sites for schools and public buildings, and for the sanitary requirements of the intended town may be satisfactorily arranged, and other matters may be dealt with that in the case of suburbs, when the land is held by numerous owners, can only be carried out by a public authority. Sites for public worship have also to be considered, but these are not always easy of arrangement. They are undoubtedly a necessity, but many people who use them do not always care to live too near them. Many years ago a deputation from a certain religious community came to me to ask for a site for a chapel, and laid great stress on the advantages of having one on the estate as being an attraction to their co-religionists. Some time after, having a house to let on the estate, and knowing that a member of that deputation was looking for such a house, I sent him particulars. It actually adjoined the chapel, and he replied with charming naïveté that the house would not suit him because it was "too near." I believe that erection of the chapel has attracted members of that community to the neighbourhood, but they have all been careful to live off the estate where it was built.

The question of provision of such sites can only be dealt with satisfactorily by each body buying what it requires. Voltaire, after his visit to England, described it as a country of a hundred religions and one sauce, and if anyone tried the experiment of free sites for religious bodies he would be able to rely on each of the hundred promptly appearing; an interesting object lesson in the divagations of theological opinion in England.

A point that has to be carefully guarded against is the conversion of a site originally granted for public worship to secular purposes, and I am inclined to think the only real safeguard is to refuse to sell the freehold, but to grant a long lease, such as 999 years.

At the same time these bodies perform an important and valuable public service, and the real question is how far they can reasonably be assisted. In this respect there is a wide difference between the leading denominations with their admirable organisations and small bodies that may dissolve in the course of a generation.

As to the class of house which may be erected, a sole owner has, of course, much more control than one who owns a field or even a farm in the suburbs; but owners are all alike in this, that they are more or less dependent on the demand. It is useless building houses of a better class than is required. It only means two, three or four families in a house. One often hears complaints that a better class of house is not built, but if people don't want them and won't pay for them, there is no object in building them.

Whatever be the nature of the estate, large, medium, or small, the first desideratum is an accurate map, on a scale of not less than 44 feet to the inch. This class of surveying is practically the only really high-class land surveying that is left to the ordinary practitioner. To be of any use it must be as accurate as surveying is capable of; but when every care has been taken one is sadly conscious of the limits of surveyors, surveying instruments, paper, and subsequent plotting, when measurements are in inches.

For this reason it is a wise precaution to make a note on the plan attached to a building agreement comprising a number of plots that "all measurements are approximate."

Speaking broadly, therefore, it may be said that the question of building development is that of the management of suburban land; both that which is ripe for building and that which has a prospective building value. There are three stages, each of which has its own problems:—

---

* The turf level in the middle of the silting was five inches higher on the east margin than on the west margin of the cutting.

† A Paper read at an Ordinary General Meeting of the Surveyors' Institution.

1. The management and nursing of land growing into building land.
2. The stage of actual development and building.
3. The management of a building estate which has been covered with houses.

It is not proposed in this present paper to touch the last phase of the question at all, as its problems are sufficiently numerous in themselves to demand an evening's discussion.

The management and nursing of land growing into building land is comparatively simple, though all-important. Such land is generally worth more than merely agricultural land. Proximity to a town usually, but by no means always, adds to the agricultural value; but when it is on the immediate edge of the building fringe it is liable to trespass over every part, and frequently becomes next to valueless for that reason; so that as it grows more and more valuable as building land it becomes less and less valuable as agricultural or accommodation land, and when building development begins on an estate it frequently happens that land previously let at 3*l.*, 4*l.*, or 5*l.* per acre has to be let for a merely nominal rent of 1*l.* an acre, or indeed less. Where, however, it is possible to grant a lease of seven years or more, the land not uncommonly commands a high rent for such purposes as sports, and for recreation grounds; but where building is imminent and it is deemed inadvisable to tie the land up for so long a period, all that can be done is to let it for rough grazing or allotments, or some such purpose.

As regards allotments, it is well to enter a caveat; because if the land is let for that purpose, and is suddenly and urgently required for building, compensation has to be paid to the tenants, and it may well be that that compensation may prove of a most serious nature. For example, to have to compensate the grower of mushrooms when his beds are at full bearing would involve an amount which might in some cases equal the fee simple value of the land. If, therefore, any land is let for allotments it should only be on conditions which have been very thoroughly considered, and which provide for such serious contingencies.

Again, it is at all times necessary with this class of land to keep a sharp look out for encroachments; ditches are quietly filled in by some enterprising building neighbour; lights are opened which may later have a damaging effect, and in many other ways questions are constantly cropping up which are troublesome from their frequency and from their very smallness.

As regards ditches it may be desirable to point out, as it so often forms a subject of controversy, that the owner of the hedge also claims the ditch for its whole width, however wide that may be, and without any limit of four feet or any other number of feet or links. In Middlesex, where the ditches are badly kept, and where the original width is not easily defined, it is usual to allow four feet from the stub of the fence; but there are many cases where a considerably greater width may properly be claimed.

At this stage a building estate is by no means an unmixed joy to its owner, and still less is it so to its owner's agent. It is unprofitable and worrying, and one can only admire the subtle humour of the authors of the immortal Budget who justify their "Undeveloped Land Tax" by pleading that the owners wanted, in what I believe is the classic phrase, "ginger," to induce them to turn it to some profitable uses.

Then, again, it is necessary to keep an eye upon the doings of local or borough authorities, so that in the all-important questions of main drainage, the interests of the estate may be adequately safeguarded, and provided with such means of drainage as are necessary. It is probably needless to say that by cordial co-operation with the surveyor of the authority, it is always possible to render him much and very acceptable assistance, which, except in the rarest of cases, will be reciprocated. Every main drainage scheme, therefore, has to be carefully considered.

Again, questions with adjoining owners have to be worked out, such as the straightening of boundaries, securing through roads, exchanges of land for mutual advantage, and other similar matters.

There are not a few intricate legal questions that frequently arise at this stage. When does a lane become a "new street" is a problem that has for some time puzzled the lawyers, and the only answer they have arrived at so far is that it is a question of fact in each case.

What right of entry has an owner into a public sewer? For house drains his right is unquestioned; but sometimes if he wishes to open up a building estate, and to discharge his new sewers into an existing sewer, the sewer authorities may object on the ground that their sewers are already overburdened, or on other grounds, and a long and tedious negotiation, with perhaps an appeal to the Local Government Board, may be necessary, though in the meantime the owner may be paying undeveloped land duty as a punishment for keeping his land out of the market.

Further, the Town Planning Act will no doubt throw upon surveyors the task of co-operating with local authorities in order that the wider issues under that Act may be carefully worked out.

If, therefore, there is plenty of work for the surveyor at this stage, it cannot be said that it is of a directly remunerative character, and all parties concerned are no doubt very glad when some direct return is forthcoming.

Sometimes, indeed, after everything has been done to provide for the expected building development, either from what is inelegantly called "a slump," or from the popular demand finding its way into other directions, the estate may hang fire for years to the great loss and disappointment of all concerned.

Assuming, however, that everything has been done to prepare for building, and that the demand exists, the question arises as to the lines on which the estate shall be developed.

It may be said at once that the overmastering problem of building development is finance. It is probable that every acre of land by the time that it has been covered with buildings has required an expenditure of, in round figures, not less than 10,000*l.*, and to raise this money in the cheapest manner possible is the first element of success, and must be so long as this is a competitive business. When it is considered that a great deal, perhaps the majority, of this work is carried on by small builders, it is a matter worthy of note that as a rule the supply of houses is well in advance of the demand.

(To be continued.)

THE ARTIFICIAL LIGHTING OF HOSPITALS.*

No one who has had any insight whatever into the work of modern hospitals could do otherwise than feel the greatest admiration for the splendid service and effective equipment that characterise those institutions; and yet it must be said that models of elegance and hygienic forethought as they are their excellence is usually marred by the engrafting thereon of systems of artificial lighting that would justify a repetition of Miss Nightingale's trenchant observation that "the very first requirement in a hospital is that it should do the sick no harm."

In visiting the principal London and other hospitals I have been keenly struck with the universal want of discrimination in lighting; there is a kind of trade orthodoxy which cherishes certain forms and fittings, and decrees their use often in defiance of common sense. Take, for example, the ubiquitous plain 10-inch opal shape pendant that does duty with equal impertinency in ward, kitchen, operating theatre, corridor, and consulting-room. It would be difficult to find a more irrational, inefficient, and indefensible fitting for most of the purposes to which it is applied, while it can hardly lay claim to be a thing of beauty. The shade affords no protection to the eyes of patients or nurses against the sting of the glowing filament, and from the fact that thousands of cardboard "eye-screens" have been sold to patch up this so-called "shade" for the necessary protection of the eyes of the healthy and vigorous in office and shop, it must be obvious that it is unsuited to a hospital. Again, the shade darkens the ceiling, and, by preventing reflection from its large white surface, practically darkens the room.

Another token of orthodoxy is the swan-neck bracket, which, with its popular form of "shade" that shades nothing, and its bare light, has been described as "nothing less than an instrument of torture." In some hospital wards the brackets have been mercifully placed lower and closer to the walls. Much more might be said to show the need of reform.

It is not so much a question of gas *v.* electric or any other illuminant as that of the art of illumination which regulates the arrangement of the lighting units after they are brought into the room. I do not propose, therefore, to enter into a comparison of the merits of the various lighting media, although some plain statements from one unbiassed by any of the conflicting commercial interests might prove useful.

---

* Abstract of a Paper read at the Congress of the Royal Sanitary Institute at Belfast, by Mr. John Darch.

I will only say that whether electricity, coal gas, acetylene, petrol-air gas, or even oil lamps be employed, it should be possible to successfully illuminate every department of a hospital with either.

Light (and in that term radiation both visible and invisible must be included), like any other form of power, may become an agent of destruction or a minister of health and blessing precisely in accordance with the wisdom shown in its application; and it is the duty of the professional adviser, be he architect or engineer, to understand all that pertains thereto before he can pretend to satisfactorily invest his buildings with the instruments of such a force.

There are to be avoided, on the one hand, the evils of glare, and particularly that which, in a ward patient, would enter the lower part of the eye; the evils of excessive brilliancy, of violent contrasts of light and shade, and of the injurious and troublesome rays of heat and actinism; there is also to be avoided the risk of eye strain consequent upon insufficient light or upon the effort to see in the face of misplaced lights. On the other hand, there is to be sought the comfort of a soft and well-diffused light so arranged that vision may be both easy and pleasant, which, after all, is the proper object of lighting.

The value of illumination depends not on the amount of light that is shed throughout a room, but on that which is reflected from visible objects. An essential part, therefore, of any scheme of illumination is the colouring of walls and ceilings, the strength of which must be properly balanced with the amount of light available. Dark colours eat up the light, and are, therefore, wasteful. White ceilings, cornices and friezes not glossy, with pale tinted walls and slightly darker dados, will best serve the hospital and its inmates.

Let us proceed to consider some practical methods of dealing with the subject, and begin with

The Hospital Ward.

The average ward unit—of, say, twenty beds—should be provided with two kinds of illumination, viz. (1) general, and (2) local.

1. The general lighting need be no more than enough to see clearly about the room, say, 0.5 foot-candle.

No sources of light, nor any illuminated surfaces exceeding 0.1 candle-power per square inch (14 c.p. per square foot) should be exposed to the patients' or nurses' eyes; whereas the intrinsic brilliancy of the

Gas mantle averages	30 c.p.	per square inch.
Acetylene flame	40	,, ,,
Electric carbon filament	400	,, ,,
,, metallic ,,	1,000	,, ,,

Direct illumination, therefore, useful enough in the lofty outpatients' hall or elsewhere, is quite unsuited to a hospital ward.

Direct lighting lamps may, however, be used if provided with proper shades, but everything depends upon that word "proper." Glass shades and all transparencies are inadmissible, nor should any partial translucency exceed the above-named limit of brightness, while any shade that is used should effectually screen the eyes without materially darkening the room. If bracket lights are used for general lighting, a half circle shade should be used so as to illuminate the wall. The practical result of all this is a soft all-over illumination which is very pleasing.

High placed ceiling lights will prove equally successful with a carefully calculated shading.

Indirect lighting by means of the inverted electric arc is deservedly gaining favour, but although it would serve well in many parts of a hospital, I could not recommend it for the ward, as the ceiling would be too dazzling for those who have to lie on their backs.

A happy effect may, however, be obtained from indirect lighting, with tungsten or other metallic filament lamps, placed inside a shallow metal bowl, white on the inside. To obtain the best effect they should be hung as low as convenient, nor should the lamp be set too low in the bowl.

Excepting in the winter, artificial lighting is little needed in the ward, for hospital economy favours very early hours, but some sort of subdued lighting is necessary during the night watch all the year round. With gas or acetylene a small burner, shaded, on a bye pass would do. In electric lighting, several expedients have been adopted, but a 2-c.p. shaded lamp is the most economical. An excellent arrangement is indirect lighting from an 8-c.p. lamp in a small bowl. This is employed, for night purposes only, at Tooting Bec Asylum.

2. *Local Lighting.*—The sisters' and nurses' tables should each have a well-shaded lamp, that is adjustable in height, so that any desired intensity may be obtained. A comfortable illumination for reading is 4-foot candles, but 10-foot c. is not too much for some purposes. A good form of shade is a deep cone of dark green opal, with the lamp entirely recessed. A more cheerful form would be one with a rose silk flounce with white lining, deep enough to hide the lamp, and for cleanliness the top should be of white opal glass, and the flounce easily removable.

The patients' lights are best placed one at the head of each bed, hidden in a dark green opal shade and somewhat to the left, so as not to radiate heat on the patient's head, and to avoid gloss in reading. An illumination of four candle feet should be available. This lamp will be useful for examination, and should illuminate the patient's chart. Near this there should be a plug for a hand or standard lamp.

If gas is the lighting medium, a "bijou" inverted mantle similarly shaded would be suitable for both patients and nurses. If acetylene, a small flame burner.

Steadiness is an essential condition of good sanitary illumination, for fluctuation and flicker are not only very disturbing, but may amount to permanent injury. This trouble may arise (*a*) from the glow lamp when used on an alternating current whose frequencies are below, say, 35 per second; (*b*) from an arc lamp when the light varies in intensity and colour, due to unsuitable or impure carbons, or when it "pumps," due to defective feed mechanism; (*c*) from the gas mantle, due to an ill-regulated air supply, accumulated condensation in pipes or the wind from the open windows of the ward; and (*d*) from all flame burners by the two last-mentioned causes.

Gloss is frequently as troublesome as bare lights, and ye the majority of hospital wards have shiny ceilings. Ther should be no difficulty in getting a diffusive or dead surfac as sanitary as that of the objectionable gloss.

The Operating Theatre.

The operating theatre needs good artificial light, and plenty of it, for there is a large proportion of surgical wor done after dark. It should have a separate general illumination with screened lamps over the sinks and sterilizers The ceilings and walls should be completely reflective, an are best lined with close-jointed white glazed tiles or opalite with a little relief in the form of a pale green or grey dado.

The illumination of the operating table is, of course, th leading consideration. The light should approximate to th colour, the perfect diffusion and the high intensity of broa daylight; both the nuisance of overhead heat and the sept risks of dust collection should be avoided, and the fitting and glass employed should be plain, smooth and easi cleansable.

It is important that the lights should not all be clustere together, forming deep and troublesome shadows, nor situated directly over the table to worry the surgeon with th shadows of his own head and hands, or that would necess tate the frequent shifting of the table. Yet these are th arrangements most commonly met with.

Every hospital has its own pattern of operating lig (scarcely two are alike), while many of them are ve curiously contrived. The following may be taken as typic of the more usual arrangements:—

1. One or more plain shade pendants of the common typ sometimes with a dust-raising counterweight and pulley.

2. A cluster of from two to twenty glow lamps under large opal shade.

3. Rectangular trough 4 feet long with opal sides, full lamps, and sometimes with a sheet of opal glass underneat this gives an excellent light, but the heat is intolerable.

4. A four or six light electrolier, each arm with a separa lamp and opal or aluminium bell shades.

Either of the foregoing may depend from the ceiling from the end of long swing brackets. Glow lamps shou have metallic filaments; tungsten is said to give the white light. Gas burners are sometimes attached.

At Charing Cross the drawback of concentration is w met by distributing the light over the long arms of fo brackets and round the gallery front.

The London Hospital and that at Ryde are fitted wi Marshall's operating light, consisting of a fixed centr 100-c.p. lamp under an opal reflector, with four hinged arm each with a 60-c.p. Nernst lamp in a condenser tube proje ing the light to any desired spot.

Electric arc lamps are employed in some continent theatres.

Direct lighting with ordinary arc lamps is out of t question on account of the unavoidable shadows; excepting, perhaps, for general lighting. But where there is a large skylight a splendid direct illumination may be obtained from white flame arc lamps, which have a remarkably high efficiency, and throw most of their light downwards. Four of these may be suspended over, but not too close to, the ceiling light, which should be of clear fluted glass to spread the light. They may be fixed, or may move on rollers worked by cords in the room. Questions of dust and the intrusion of lamp trimmers are thus eliminated.

Indirect arc lighting, particularly where there is no skylight, is eminently suitable. Four 10-ampere open arcs, properly placed and reflecting directly against a white ceiling, would give a brilliant illumination, with all the advantages of daylight.

Professor Siedentopf has invented an ingenious arrangement for lighting the operating table by means of isolated beams of light, which are not only ample but entirely avoid the dust question.

There are two forms of it:—

1. The single, in which a 20 ampere projector, or search light, is placed outside the theatre, and about 7 feet 6 inches high, from which a parallel beam of light is directed through a hole to a small mirror, thence to the table, or through a second mirror to the table. This beam is controlled by an iris diaphragm and smoked glass. It is best suited to the gynecological and throat theatres. It is necessary to have good general lighting.

2. The compound form is more satisfactory. A projector lamp as before, but of 25 to 30 amps, directs the light through an aperture to a thin metal disc, on which are placed small distributing mirrors which divide the main beam into a number of smaller ones, and which are separately projected to receiving mirrors placed around the room. These mirrors re-unite the light on the table in a many-sided form, free from shadows.

Electric fuse wires have a knack of "going" at most inopportune moments, while a breakdown on the part of a supply company is not unknown. It is, therefore, essential to have a reserve for such an emergency. The fusing trouble is more common on branch circuits; one excellent precaution, therefore, will be found in wiring glow lamp fittings from two separate main branches, either of which failing, enough light may be left to work by.

To provide against failures on the main there are two methods:—

1. A gas lamp with an inverted mantle, as at the West London Hospital, which should be lit during operations.

2. An electric accumulator, from which a small emergency lamp should be kept alight during operations, and in connection with which it should be possible to immediately switch on sufficient light from the accumulator to complete an operation. Separate lamps would be required for this purpose unless it would be convenient to have the voltage of the accumulator equal to that of the circuit.

Some hospitals keep oil lamps ready to hand.

Hand and standard electric lamps of a variety of patterns are to be found in every operating theatre.

The Dispensary

is usually the worst served of any department. It is, in London, frequently to be found in the basement or in some other part of the building lacking daylight, while the artificial illumination is commonly so inadequate that it sometimes becomes a difficulty and a worry to read the prescriptions.

A properly shaded light yielding four or five foot candles is required to each man on the dispensing benches. The shelves should be illuminated with screened lights to facilitate visual acuity; in fact, no bare lights should be visible. Undoubtedly, the inverted arc lamp with a white ceiling would afford the best illumination, while the running cost of it should compare favourably with that of glow lamps.

Where is the dispensary or laboratory that provides facilities for reading the graduated measuring glasses? Nothing is more productive of eye strain than the effort to decipher any kind of graduated scale, but with the faint lines of a glass measure in the twilight of the average dispensary held up to a patchwork background of bottles the strain is increased. It would save time and afford comfort if small white screens were fitted up, one in front of each man, adjusted to catch the chief incident rays from a skylight or window at such an angle that they reflected towards the dispenser. The same screen could be used under an artificial light or in a permanently dark situation, or there should be an illuminated panel of either reflected or transmitted light.

ARCHÆOLOGY IN PERU.

A communication presented to the British Association at the Portsmouth meeting, 1911, by Miss A. C. Breton.

In recent years there has been much activity in the field of Peruvian archæology. At Tiahuanaco (which must always be associated with Peru, though now within the borders of Bolivia), M. G. Courtz, of the expedition of MM. Sénéchel Lagrange and de Créqui-Montfort in 1903, excavated the wide monolithic stairway which forms the eastern entrance to the great enclosure called Kalasasaya. He then dug along the western line of monoliths, and found that they were connected by a wall of cut stone. On that side he uncovered the double walls of another enclosure, and to the east he found a smaller one, constructed in similar style to the Kalasasaya, with upright monoliths at almost equal distances from each other, and a connecting wall of smaller squared stones, uncemented. From this wall projected a number of human heads, carved in the round from trachyte, and apparently portraits. Some of them are now in the Museum at La Paz. In 1910 the Bolivian Government had the Puerta del Sol set upright and cemented, and erected a shelter for the many sculptured stones which had been found. An underground chamber of carefully cut and fitted stone, discovered in 1908, is only 1 m. 40 cm. by 1 m. 30 cm. (not including five steps which lead down to it), and 1 m. 83 cm. high. The roof is of flat slabs of andesitic lava. Five colossal statues have been disinterred, of which the larger is 5 m. 72 cm. high. They are covered with finely incised designs. On the breast of one is a figure of the deity represented in the centre of the Puerta del Sol, surrounded in this case by standing personages. Another has several minute faces on its hands, and a face on each finger-nail.

Small portions of the great pyramid-building Ak-kapana can be seen—terrace walls of well-cut stone, but the masses of earth thrown out from the excavation of the centre (the present hollow is said to be more than 300 feet in diameter and 60 feet deep) hide the greater part. At Pumapanku, on the opposite side of the Indian town, a number of huge blocks of stone remain at the edge of the plateau. Although many hundreds of tons of worked stones have been removed from the ruins for different purposes, there is no doubt that systematic excavation, conducted by competent persons, would result in discoveries of the greatest interest. It is a mistake to suppose that because Tiahuanaco is at the altitude of 12,000 feet, the climate is too frigid for comfort. In the middle of winter there the early mornings are cold, and frost may lie in the shade all day, but the sun is hot and the air invigorating. Plentiful crops of barley are gathered, besides the native quinces and potatoes, and the Indians are well nourished and clothed, capable of long journeys with their lamas and other animals. On St. Peter's Day they assemble in thousands to perform their ancient dances in the town square, as described by Squier. A curious feature is that those who wear great feather crowns resembling the tops of palms, after dancing for some hours, place them in the centre of the ring and continue to dance round, bending towards the crowns as if in worship.

The amazing richness of Peru in antiquities is seen in the galleries of the National Museum at Lima, which Dr. Max Uhle has filled with the results of two years' excavation in the region of Nazca, the neighbourhood of Lima, and near Trujillo, all coast civilisations. In the bay of Ancon, the first settlements of primitive fishermen were on the side hills which slope to the sea, where the rocks are covered with shell-fish. Then followed the wide-spreading town which filled the sandy area between sea and mountains, known from Reiss and Stübel's book as the Necropolis of Ancon, but now proved to have been a series of skull heaps and of reed huts, which decayed or were destroyed after the owners had been buried under them with their possessions, when others were built above. The accumulated material covers a space more than a mile square and 30 feet high. The graves are small pits lined with pebbles. Dr. Uhle spent several years in excavating at Pachacamac for the University of Pennsylvania, and has been able to form some idea of the sequence of the different kinds of pottery from his finds there and in other places. The beautiful painted pottery at Jea and Nazca proves to be earlier on the coast than any other, and the primitive fishermen learned the art of vase-painting from the proto-Nazca folk. Richly clothed mummies, feather garments of symbolic design, mosaic ear-plugs, gold and silver cups, and a cuirass covered with small metal plates, are some of the treasures of the Lima Museum.

Of the remoter Stone Age little is yet known in Peru, but chips and scrapers are found in the alluvium on the plain of

SKETCH DESIGN FOR A BLOCK OF FLATS AT MUHLHAUSEN.—Herr ALBERT GESSNER, Architect.

Lima, and the deposit with fragments of rude pottery, observed by Darwin, can still be seen on the top of the cliff near Bellavista.

SHERIFF HUTTON CASTLE, YORKS.

AT a visit of the York Archæological Society to this Castle, the ruins of which can be seen from the York and Scarborough railway, between Strensall and Flaxton, Mr. R. B. Cook gave the following historical and descriptive account:—

Although now a deserted ruin, time was when princes held state and nobles met together within its sturdy walls, and not a little of the martial grandeur of mediæval feudal England surrounded the place, as its history and remains alike testify. At the time of Edward the Confessor and William the Conqueror, the Saxon Ligulf held lands at Bulmer and Cornborough in the neighbourhood; and during the reign of Henry I. his successor, Bertram de Bulmer, was a man of importance in the district. The yet more famous son of this man, Sir Bertram de Bulmer, called "Bertram fil Bertram," became High Sheriff of Yorkshire, and founded the Castle at Hutton, afterwards called from the office he held, Sheriff Hutton, in 1140, during the reign of King Stephen; and in the civil wars between that Prince and his cousin, the Empress Maud, the castle was seized for the King by Alan, Earl of Brittany and Richmond. It was, however, restored to Sir Bertram de Bulmer, upon whose death it came into the possession of his son and heir, Sir Henry de Bulmer, Knight, who died without issue, leaving his sister Emma his sole heir, by whose marriage with Geoffrey de Neville, of Horncastle, in the county of Lincoln, the Castle of Sheriff Hutton passed into the ownership of the powerful family of Neville. For more than three hundred years Sheriff Hutton Castle remained in the possession of that celebrated and illustrious family. Ralph de Neville, first Earl of Westmorland, a prominent character in Shakespeare's historical plays of Henry IV. and Henry V., rebuilt the castle early in the 15th century, and his widow Joan, who was a daughter of John of Gaunt, resided at Sheriff Hutton Castle after his death. There is an interesting bequest to this lady in the will of John Morton, Esq., of York, proved October 5, 1431, wherein he bequeaths to that most noble Lady Johanna Countess of Westmorland "unum librum de Anglico vocatum Gower." This of course is a copy of the English works of the poet Gower, and seeing that he is reputed to have belonged to the ancient family of Gower of Stittenham hard by Sheriff Hutton, the occurrence of this bequest to the Lady of Sheriff Hutton Castle is of peculiar interest. Another most interesting will registered at York is that of Richard Earl of Salisbury, eldest son of this Lady Johanna and Ralph Neville, Earl of Westmorland. It is dated May 10, 1459, and 37th Henry VI., and contains a clause:

"I will that my feoffees stand seized of my Castle and Manors of Sheriff Hutton, East Lilling, West Lilling, and Raskelf to the use of my wife, Alesia, during her life, and afterwards the same to remain to Richard, my eldest born son."

Now this Richard was the greatest Englishman of mediæval days, being no other than the powerful Richard Neville, Earl of Warwick, the renowned "King Maker" and "Last of the Barons" celebrated in Lytton's enchanting romance, who was for some time constable, and afterwards owner of the castle.

A Gift to Richard, Duke of Gloucester.

After the death of that powerful noble at Barnet, in 1471, Edward IV. seized Sheriff Hutton Castle and gave it to his brother Richard, Duke of Gloucester, who subsequently married Ann, the daughter of Warwick, and after deeds of treachery and murder ascended the throne as Richard III. By him Anthony Woodville, Earl of Rivers, was sent a prisoner to Sheriff Hutton Castle, whence he was removed to Pontefract Castle and there beheaded. Several of the cruel usurper's letters, dated from Sheriff Hutton, remain to this day. After he had ascended the throne he imprisoned in this castle Edward Plantagenet, Earl of Warwick, the only son of his brother George, Duke of Clarence, then a boy of

MODERN EUROPEAN ARCHITECTURE.

GERMANY.

SKETCH DESIGN FOR PART OF A TOWN PLAN AT WILHELMSHAVEN.—Herr ALBERT GESSNER, Architect.

fteen years of age, and also his niece, the Princess Elizaeth, eldest daughter of Edward IV. When a term was at ength put to the life of the infamous usurper on Bosworth ield, in 1485, and Henry Earl of Richmond gained both a ingdom and a crown, the youthful maiden exchanged her rison cell for a throne by becoming the wife of the conueror, and so uniting once and for ever the rival Houses of ork and Lancaster.

> Let Richmond and Elizabeth,
> The true succeeders of each royal house,
> By God's fair ordinance conjoin together.
> Shakespeare's "Richard III."

But the event which set free the Princess Elizabeth from he walls of Sheriff Hutton Castle, and raised her to the hrone of England, did not, alas, deliver her hapless cousin, he young Warwick, from prison. Henry Tudor was too oldly politic to allow the last male heir of the Plantagenets is liberty; and although the very day after the victory f Bosworth he despatched Sir Robert Willoughby to take he young prince from the charge of his keepers at Sheriff Iutton Castle, it was only to have him conveyed privately the Tower of London, where, after fourteen years' mprisonment, he was cruelly beheaded on November 26, 499.

Residence of the Hero of Flodden.

For some time after his accession Henry VII. did not sit ery securely upon the throne. During the time of the nsurrections in the north, while the King held possession f Sheriff Hutton Castle, he sent Thomas Howard, Earl of urrey, the hero of Flodden, and afterwards Duke of Norfolk, quell the insurgents; and that nobleman resided at Sheriff Iutton Castle between 1490 and 1500, as well as at intervals n after years, during which time the old castle was the cene of great festivity. John Skelton, the poet laureate of he time, has left us a record of the beauty and fashion of he period which were wont to assemble within its walls in is curious poem of "The Crowne of Lawrell," the scene of hich is laid at Sheriff Hutton, in the Forest of Galtres, bout the year 1520. In this poem Skelton describes himself s falling into a slumber while musing in the neighbourhood f the Castle. He then sees the Queen of Fame in converse with a "Goddesse immortall," Dame Pallas, as to his merits to be crowned with laurel. After Gower, Chaucer, and others have testified to the merits of the poet, he is conducted into the stately hall of Sheriff Hutton Castle, where sate the noble Countess of Surrey in a chair, surrounded by a bevy of fair ladies, whom she thus addresses:—

> Come forth gentilwomen I pray you, she said,
> I have contryved for you a goodly warke,
> And who can work best now shalbe assayd.
> A cronell of laurell with verdures light and larke
> I have devised for Skelton my clerke.
> For to his service I have such regard
> That of our bounty we wyll hym rewarde.

And so the fair "bevy" set to work and weave the laurel crown for the poet, who in return addresses each one of them with a stanza in her praise. The names of the ladies so addressed are: The Right Noble Countess of Surrey, my Lady Elizabeth Howard, my Lady Myrrial Howard, my Lady Anne Dakers of the South, Mrs. Margary Wentworth, Mrs. Margaret Tylney, Mrs. Jane Blenner Haiset, Mrs. Isabel Pennell, Mrs. Margaret Hussey, Mrs. Gertrude Statham, and Mrs. Isabell Knight. Poor ladies; with their "saumplers," and laces, and weaving frames, and the delicate work they wrought. "With fingers smale, and handes as white as mylke, where be they now?" Poor vain poet, too! The scene where thou dreamt thy vain dream is changed. The Forest of Galtres, the stately hall of the castle, and the admiring bevy of fair ladies have all passed away, and only ruined walls and an archaic poem still remain as relics of those bygone scenes.

When the Castle was in its Glory.

The old Duke of Norfolk, who had received a grant of the castle for life, died in 1524, and then Sheriff Hutton Castle reverted to the Crown. In the following year it became the residence of Henry Fitzroy, Duke of Richmond (natural son of Henry VIII., by Lady Tailbois, daughter of Sir John Blount, and widow of Sir Gilbert Tailbois). The young Duke, though only six years of age, was appointed by his father Lieutenant-General of the North and Warden of the Scottish Marches. He was attended by a Council to assist him in the administration of affairs, and by the persons appointed to superintend his education. Several letters of the Council, dated from Sheriff Hutton Castle, are still extant, and in the British Museum is still preserved one in the boy Duke's own handwriting to his Royal father, dated Sheriff Hutton, November, 1529, thanking the King for the care he had taken of his education, and promising all attention and diligence in the same. The young Duke, who died before he attained manhood, is supposed to have left Sheriff Hutton in the year 1530. The castle was then in its glory, and the following description of it is given by Leland, who wrote soon after that time:—

"The Castelle of Sherhuten as I lernid there was buildid by Rafe Neville of Raby the fyrst Earl of Westmerland of the Nevilles, and I hard that in his Tyme he buildid or greatly augmentid or repairid 3 Castelles by side.

"There is a Base Court with Houses of Office afore the entering of the Castelle.

"The Castelle self in the Front is not dichid, but it stondith in loco utcunque edito.

"I markid yn the fore Front of the first Area of the Castelle self 3 great and high Toures, of the which the Gate House was the Midle. In the secunde Area ther be a 5 or 6 Toures, and the stately Staire up to the Haule is very magnificent, and so is the Haule itself, and al the residew of the House; in so much that I saw no House in the North so like a Princely Logginges.

"I lernid ther that the Stone the Castel was buildid with was fetchid from a Quarre at Terrington a 2 miles of.

"There is a Park by the Castelle.

"This Castel was well maintained by reason that the late Duke of Northfolk lay ther X Yers, and sins then the Duke of Richemond."

Soon after the time of Leland, however, probably during the latter half of the sixteenth century, the castle of Sheriff Hutton must have been dismantled, for a commission of survey reported in 1624 that "the bowels of this worthy pile and defensive house are rent and torn," the "naked carcase" being only then standing. James I. leased the castle, manor, and park to Sir Arthur Ingram, Knight, and when he visited York in 1617 rode out on Monday, April 14, to Sheriff Hutton Park, where he knighted Sir Richard Harper of Derbyshire, Sir John Hepsly, and Sir William Bellasis of Durham. On the following day he left York for Ripon and the North. King James I.'s grant of Sheriff Hutton Castle was afterwards enlarged by Charles I., who gave the same to Sir Thomas Ingram, his heirs and assigns for ever. The castle still belongs to the present representative of that family; but the park was purchased during the reign of Charles II. by Edward Thompson, Esq., whose descendants sold it to the present owner, W. Coates, Esq., about thirty years ago.

The Ruins of To-day.

The ruins of Sheriff Hutton Castle stand upon a gentle eminence facing the village, and are quadrangular in form, with a large open space in the centre, and a lofty square tower at each corner. The principal entrance has been on the east side, where there is a gateway with a pointed arch, above which are four shields of arms in a sunk tablet, each surrounded by a wreath and bearing the plain saltire of the Nevilles. The third shield also bears the Royal arms of England and France in commemoration of the marriage of Ralph Neville, first Earl of Westmorland, with Joan, daughter of John of Gaunt, one of the Royal family of Edward III. It is thought from these armorial bearings that the castle must have been completed some time during the first quarter of the fifteenth century. The four corner towers, though all in a ruined condition, present a very bold and commanding appearance. That nearest the entrance gateway (the south-east tower) is supported outwardly by strong buttresses. In all cases the floors and interior apartments have been demolished; although remains of the circular winding staircases, fireplaces and windows of the various rooms may still be seen. Under each of the south-west and north-east towers is a subterranean chamber measuring about forty feet by twenty feet, the roof arched over with stone; above which, on the ground floor of the castle, is, in each of these towers, an ancient chamber similarly arched over with a vaulted ceiling. The towers approach 100 feet in height, and may be seen from a considerable distance. On the south side of the castle are two oblong moats or double fosses, each about 200 yards in length and six yards wide; but they do not appear to have surrounded the building. Very different are the remains of Sheriff Hutton Castle now to the magnificent building of which Leland wrote. The stately "Staire" and no less stately "Haule" have disappeared. The place where princes lived and noble lords and ladies ofttimes joined in scenes of mirth and festivity is now (sic transit gloria mundi) occupied by stables, cowhouses and barns! The palace has become a farmyard, and when last we visited it the inner area of the castle, once the recreation ground of the great, was filled with corn and hay stacks, and a noisy thrashing machine told of the farmer's preparation for rent day. But, however much we may regret the apparent neglect which seems to reign around, to those who love to visit scenes famous in past history, the old castle will always be an object of interest, and the pleasant walk of a little over two miles which leads from the station of Flaxton through the picturesque park of Sheriff Hutton to this venerable relic of ancient days will add an extra charm to the pleasure of all who pay a visit to the remains of Sheriff Hutton Castle.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) illustrates some buildings by Messrs. Frank Miles Day & Brother; also by the same firm in conjunction with Mr. Klander, a successful competition design for Synagogue Adath Jeshurum, Philadelphia; a reredos in Trinity Church, Wilmington; and a branch library of the Philadelphia Free Library. The Second Congregational church and schools, Lynn, Mass., by Messrs. Nelson & Van Wagenen, associated with Mr. George H. Breed as architect, are also illustrated.

The *Architectural Record* (New York) issues a special Pittsburg number, in which separate chapters are given to the terrain and the rivers; the business quarter and commercial buildings; a real civic centre; the modern auditorium church and the homes of Pittsburg. There are also included in the number letters of Stanford White to Augustus Saint-Gaudens.

La Construction Moderne (Paris) contains a description and illustrations, including plans, of a hotel at Roubaix, of which Mons. Bruno Pelissier is the architect. There are also illustrated some blocks of workmen's dwellings designed by Mons. Georges Vaudoyer.

Deutsche Bauzeitung (Berlin) concludes its account of the buildings at the International Health Exhibition at Dresden, and has an illustrated article on Raphael as an architect. The interior treatment of the cathedral church of St. Peter at Bautzen by Professor Fritz Schumacher is described and illustrated, as also is the town hospital of Rixdorf, near Buckow, of which Stadtbaurat Reinhold Kiehl is the architect.

Het Huis (Amsterdam) has illustrated articles on the Waag at Hoorn, and on copper work from Java and Sumatra in the ethnological museum at Rotterdam.

Moderne Bauformen (Stuttgart) has for its principal items illustrations of the new Schloss Rheinweiler at Baden, by Ernst Haiger, of Munich; of several buildings by Schlösser and Weirether, of Stuttgart; and some charming reproductions of water-colour drawings of internal decoration by the Brüder Ludwig, of Munich. A number of small houses by Professor Heinrich Metzendorf show considerable picturesque originality.

Correspondence

SPECIMENS OF WORK DONE IN THE STONE-CARVERS' SHOP, TRADES' TRAINING SCHOOLS.

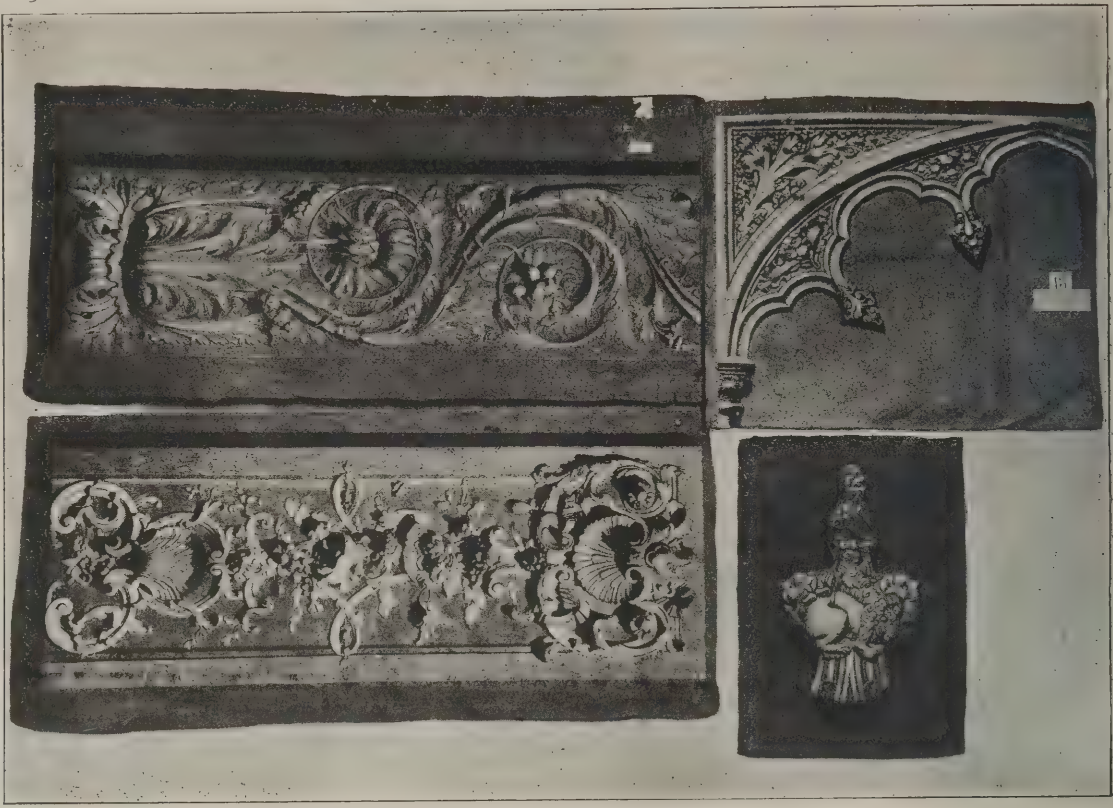
TRADES' TRAINING SCHOOLS.

THAT the good work done in the past at the Trades' Training Schools maintained at Great Titchfield Street, London, by the Worshipful Companies of Carpenters, Joiners, Painter Stainers, Plaisterers, Tylers and Bricklayers, and Wheelwrights, is still being continued is evident from the annual report, which has just been issued.

It is also gratifying to find that, even in these days of socialistic trade-unionist principles, when levelling down to the capacity of the inferior workman is sought, there are more than two hundred young craftsmen possessed of ambition to improve their powers in the particular occupation by which they earn their living. For it is a peculiar feature of these Schools that admission is restricted to those actually engaged in the trade for which instruction is given. The Worshipful Companies of the City of London who support these Schools are thus endeavouring to carry out one of the principal objects for which they were originally founded, to maintain a high standard of performance in the trade or craft with which they are associated.

An important feature in the methods adopted in the Trades' Training Schools is that as far as possible the students are allowed to choose their own subjects and make their own designs for the work that they execute. Hence in the speech which Sir Aston Webb addressed to the students after presenting the prizes to the fortunate winners he wisely urged the importance of their endeavouring to impart a sense of beauty to their work in addition to the attainment of mechanical accuracy, which is too often the only goal of the present-day craftsman. The modern workman sees all around him the wonderful accuracy of machine work, and the conscientious joiner and mason endeavour to equal that mechanical accuracy, forgetting that in so doing they are attempting the almost impossible, which, if they achieved, would but reduce them to the level of a brainless machine and be an abandonment of their superiority to the machine, the power to think and to express thought and feeling.

Accurate craftsmanship is admittedly desirable to the extent that it is necessary for the proper performance of the functions for which an object is made. Doors that will not shut and windows that will not open, however much endeavour may be spent on their design, are not good craftsmanship, and therefore not truly beautiful, for fitness is an element of beauty, though not its finality. But there is a vast difference between the accuracy that is necessary for fitness and that of a machine-tool, and within this difference lies the artist-workman's opportunity for imbuing his work with a sense of beauty.



SPECIMENS OF WORK DONE IN THE WOOD-CARVERS' SHOP, TRADES' TRAINING SCHOOLS.

As Sir Aston Webb said to the students, "We all know that this sense of beauty can be given to everything—spoons, forks, tables, chairs, plates, pictures—whatever it is, and if you only keep working with that little touch in mind you will add to its chance of life, which is a very great thing, not only for yourself and your own reputation, but for those people for whom you work."

We are glad to know that in the Trades' Training Schools the possibility of making their work beautiful as well as skilful is urged upon the students, to many of whom it must come with the full force of an entirely novel aspect of their work, for in their daily life, as operative workmen, they must, under our present system of building, be almost entirely engaged in carrying out somebody else's designs, good, bad, or indifferent as the case may be. Then, again, most of the students are naturally young and inexperienced craftsmen, without any training in design, and one might therefore expect that their conceptions would be to a large extent no more than a rechauffé of incongruous elements borrowed from work upon which they had been engaged or which they had seen in the workshops where they have been employed.

From the report of Mr. H. Phillips Fletcher, the Director of the Schools, we gather that whilst advice is given, the students are left with a more or less free hand, and if they do not take the advice they are allowed to make mistakes in design and occasionally in workmanship. Enthusiasm in the class of students who attend these Schools is a sensitive plant, and would be quenched by too much strictness in the teachers; hence the permission of a free hand is wise. Under these circumstances one must not judge too severely the artistic merit of the designs produced, some of which we illustrate.

The trades for which instruction in these Schools is provided are principally those concerned with building, classes being held for carpenters, joiners, masons, bricklayers, painters, plasterers, plumbers, smiths, electrical wiremen, modellers, sculptors and architectural carvers in marble and stone, and wood carvers. There is also a Life Class for modelling, which is an excellent feature, and, we are glad to note, appreciated to the full capacity of the studio, and must be of the highest value to the students of modelling and carving. Besides the trades concerned with building, a class is held for wheelwrights.

Certainly the Worshipful Companies who are supporting these Trades' Training Schools have left nothing undone to ensure their success. The fees are low, in fact nominal; materials, tools, machinery, drawing boards and squares are provided, instruction is given by practical workmen expert in their particular trades, supervised by an architect-director, Mr. H. Phillips Fletcher, and visited by members of the Worshipful Companies. Numerous valuable prizes are given on the award of a committee of judges, including Royal Academicians and others of eminent position.

That the opportunities offered by these Schools bear good fruit is shown by the fact that at the last exhibition in woodwork held by the Worshipful Company of Carpenters, of three gold medals offered two were won by students from the Trades' Training Schools, although the exhibition was open to British subjects throughout the Empire. Numerous other prizes were also obtained in the same exhibition.

Not only are these Schools useful to workmen in the building trades, but architectural students from University and King's Colleges attend at Great Titchfield Street demonstrations in practical work. These are held in the afternoon before the regular work of the Schools commences, and the young architects who attend appreciate these opportunities of observing the methods of the practical craftsman.

NOTES AND COMMENTS.

The curriculum of the Architectural Association has been issued, and we are now able to see the extent of the drastic alteration that has been made in the personnel of the instructors and in the policy of the School of Architecture. For many years past it has been the established practice for the courses of lectures on various subjects to be given by different lecturers, presumably and probably rightly, from a recognition of the fact that most of the gentlemen available were possessed of special knowledge in the subject on which they lectured. Certainly it would be difficult to find anyone better qualified, for

SPECIMEN OF WORK DONE IN THE CARPENTERS' SHOP, TRADES' TRAINING SCHOOLS.

example, to lecture on mediæval architecture than Mr. E. S. Prior, or on hygiene as connected with practical architecture than Mr. R. Stephen Ayling. So with the other instructors; having but one subject with which to deal they have been able to make a hobby of it, and work it up thoroughly, from which their students have gained advantage.

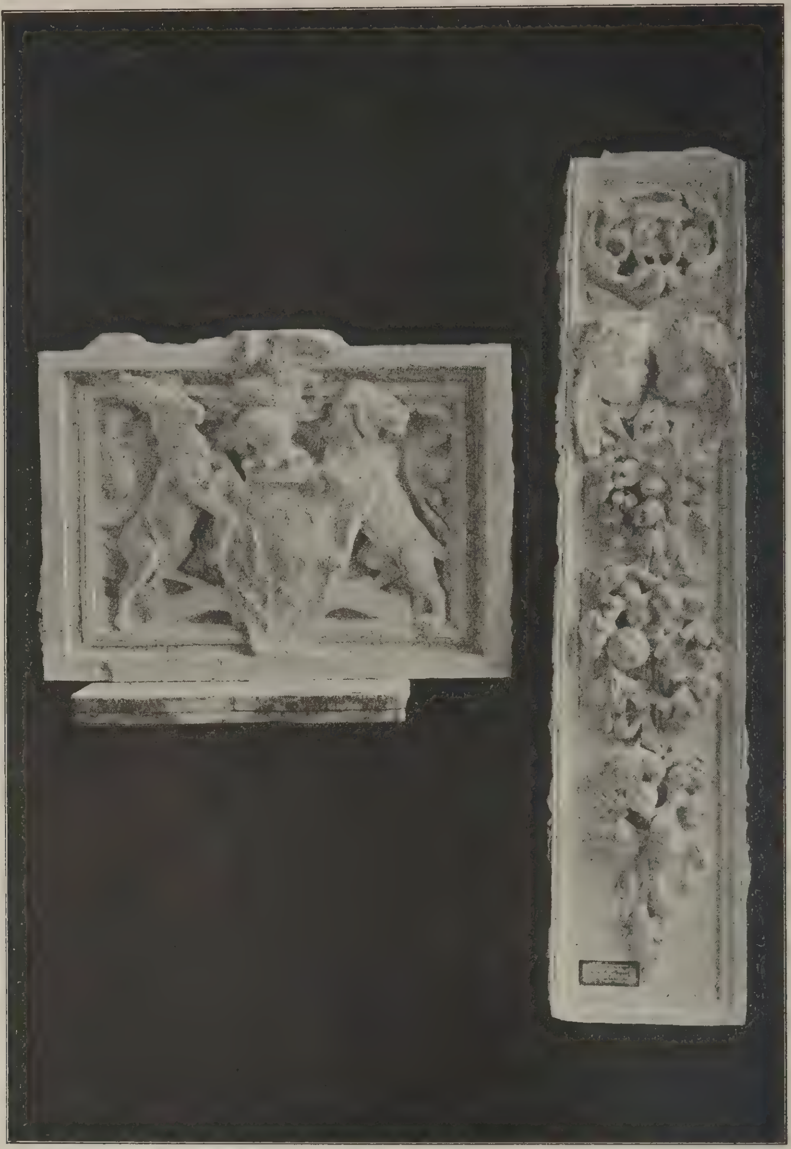
Now, with the exception of a short course on Professional Practice by Mr. A. O. Collard, the whole of the lectures are to be given by two men, Professor Beresford Pite on Architectural History, Mr. C. E. Varndell on Theoretical and Practical Construction. There is a mystic Note on page 15 of the curriculum:—"In the appointment of a Director of Education the Council have in view further developments of the educational work of the Architectural Association, which will, generally speaking, be in advance of the preliminary standard of professional qualification." We are also told that the Association is "in a position which should enable its members to take advantage of the many opportunities now offered for higher architectural studies."

What this all means we do not know. Apparently, the Council are dissatisfied with the way in which the school has been conducted in the past under Mr. Maule, although he has been persuaded, or allowed, to continue his services for another year while the new Director feels his feet. Or perhaps the change of front is merely one of those whimsical ebullitions of which there have been so many in the past few years at the A.A., and which are likely to recur at frequent intervals as long as it is governed by a Council selected for their performances and repute outside the A.A. rather than for experience within it.

It is a curious coincidence that the appointment of Mr. Pite as Director of Education at the A.A. synchronises with the appearance of the Report of the Departmental Committee on the Royal College of Art, where he has been Professor of Architecture since 1900, and one of those members of the staff who "are whole-time officers holding pensionable appointments as members of the established Civil Service." From the report we learn that "The whole-time professors are not debarred from the pursuit of their Art. On the contrary, they receive every encouragement to this, and are furnished with separate studios, and, in the case of the Professor of Architecture, with a room for professional assistants within the College." The Departmental Committee also say, "We desire, however, to point out that we do not think that the advantages of the arrangement are fully obtained if the outside work undertaken by Professors is itself of the nature of teaching or of educational organisation." Apropos of which, we may remind our readers that Professor Pite holds the post of Director of Architecture and Lecturer at the London County Council School of Building at Brixton.

From the report to which we have above referred we gather that it is the feeling of the Departmental Committee with regard to the advanced course given to students who intend to become architects "that if the course is to be continued it is essential that provision should be made, either at the College itself or by arrangement with some Technical School, for the practical study of building construction, of the properties of materials, and of those aspects of engineering and sanitation which are essential to the working architect." We are also told that the committee "are disposed to think that, while a general architectural course such as that arranged for all the College students by Professor Pite ought to be an essential element in the training of professional teachers of art, wherever that is given, the more technical training of architects can better be undertaken, either in a University, as we have suggested, or in some other institution where the constructive and the artistic elements of such a training can be continuously linked together."

We may be pardoned, perhaps, for surmising that the Council of the Architectural Association entertained hopes of becoming the "some other institution" when they concocted the mystic Note we have quoted above, and that they anticipate the abandonment by the Royal College of Art of the "technical training of architects."



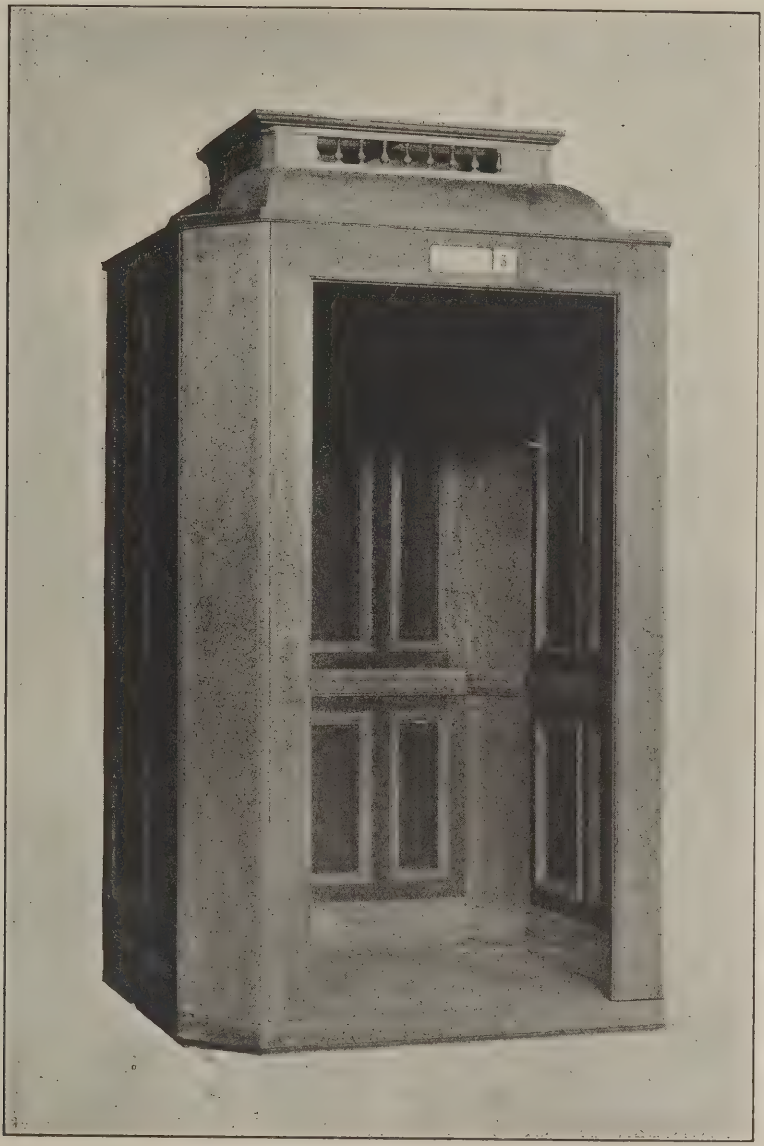
SPECIMENS OF WORK DONE IN THE STONE-CARVERS' SHOP, TRADES' TRAINING SCHOOLS.

Certainly, we think that this abandonment would be justifiable, for amongst the students who left the Royal College from February 1901 to February 1910 only seventeen obtained the Schools Associateship in Architecture, and most of these became art teachers, not architects. No doubt, there are others who have learnt in the Royal College of Art something of architecture that has been of value to them as architects, but their course in the schools has been no more than an incident in their education, and the Royal College of Art cannot flatter itself that it has turned out architects.

It is a good sign that some of the many institutions in London which have professed to supply architectural education for architects are abandoning their pretensions. There are too many schools for architects in London at present, and when King's College has merged its school with that of University College, and the Royal College of Art has parted with its Professor to the Architectural Association, we should like to see many of the Polytechnics follow suit, and drop the very indifferent instruction they now give to architectural students who intend to become architects.

Whether the Council of the Architectural Association are acting wisely in restricting the number of their lecturers is quite another question. There are limits to the knowledge and to the time of every man. Hence, perhaps, the reason why students at the A.A. next session will receive a course of lectures on the Renaissance in architecture, in which French, German, and Spanish work of the period is ignored. Mediæval architecture is restricted to English work. We cannot compliment the new Director of Education at the A.A. on the completeness of a scheme for the teaching of architectural history in which French architecture, both Mediæval and Renaissance, is omitted, nor can we admire the perspicacity of a Council which permits such an emasculated programme to stand as an example of the "further developments" which they "have in view." The curriculum for the ensuing session appears to us a very bad start.

The deficiency in the A.A. curriculum as regards French architecture during the Renaissance is, we are glad to know, to be supplied by the publication this month of a book on "The Architecture of the Renaissance in France," written by Mr. W. H. Ward, M.A., and published by B. T. Batsford. Mr. Ward has, as evidenced by his revelation of the existence of Du Cerceau's original drawings in the British Museum, given, perhaps, more minute study to the history of French architecture between 1495 and 1830 than any other living writer. We say perhaps, because we cannot decide for thoroughness between Mr. Ward and Professor Reginald Blomfield; but of this we feel sure, that no one else knows half as much about the subject as either of these two architects.



SPECIMEN OF WORK DONE IN THE JOINERS' SHOP TRADES' TRAINING SCHOOLS.

THE DEVELOPMENT OF BUILDING LAND.

By John James Done (Fellow).

(Concluded from last week.)

THE methods of dealing with building land are different in different parts of the country.

In London there are, broadly speaking, two ways, viz., the sale of the freehold in plots, and letting on leases for 99 years.

In the north of England a great deal of land is let on a perpetual rent-charge, commonly called a "chief" rent, or failing that on leases for 999 years.

A general account of the various modes of dealing with building land will be found in the Minutes of Evidence of the Select Committee on Town Holdings, which was appointed in 1886 and reported in 1887.

My own experience is almost confined to London and the south of England; for although my earliest professional experience was in the office of a Manchester surveyor, it is, I regret to say, so long since that I have lost nearly all touch with the Manchester practice.

The sale of the freehold in plots has been the method largely carried out by land companies, who purchase the freehold, make the roads, and then sell the plots on what is called "the nine-years' principle," that is to say, one-tenth of the purchase money is paid at the time of sale, and the remaining nine-tenths are paid in nine annual payments, interest being charged on the unliquidated balance; this interest is, I think, almost universally 5 per cent. per annum. The purchaser is usually given a free conveyance if he accepts the title of the vendors without investigation, and almost invariably that is done. The purchaser has, of course, the right to pay up the whole of his instalments before the time named if he chooses to do so, and if he has good luck and sells his houses he does so in order to make a title. He very frequently, however, buys the freehold plots himself and then grants 99-year leases at ground rents which give him a substantial profit on the land, which profit, however, is more apparent than real, because by fixing a high ground rent on the property he not infrequently sells the house at cost price or even in some cases at below cost price, and is content to take the profit on his creation of ground rents.

Although the leasehold system has had its fair share of abuse, it is worth remarking that on estates where the purchasers have the option of taking a lease or buying the freehold they generally prefer the lease to the freehold on account of getting their houses at a considerably reduced outlay in the first instance. On an estate of over 200 houses which has been developed in the last few years, and where the tenants had the option of the freehold or a lease, in only three cases has the freehold been purchased, and in all three cases the premises were trade premises.

The objection to the development of land by selling the freehold in plots is that no one has a sufficient interest in the reversion to exercise control from time to time and to see that the estate is kept up to a proper level; some of the worst property has been built on freehold estates, and the subsequent history has been by no means happy. Undoubtedly, the best estates are those of the large landlords who keep the freehold of the ground in their own hands, and who are able to secure the best after management of the entire property.

In dealing with leasehold estates again there are more methods than one. It sometimes happens, as in the case of corporate bodies, that they have the land but no funds

SPECIMEN OF WORK DONE IN THE PLASTERERS' SHOP, TRADES' TRAINING SCHOOLS.

to develop it, and in such circumstances it is usual to let it in large blocks to a speculator who will make the roads and carry out the whole development of the estate.

The usual method of dealing with a transaction of this kind is that leases are granted by the ground landlord as the houses are roofed in, at ground rents which must not exceed, say, one-sixth of the rack-rental value. Thus, assuming that 10 acres of land are so let, that the freehold value of that land is 1,000*l.* per acre, and that the rental value of it on lease is 50*l.* per acre, and that it is possible to build 20 houses per acre of the rack-rental value of 36*l.* each, the speculator would secure 6*l.* on 20 houses, or 120*l.* per acre; but as he is only liable for 50*l.* per acre there is generally a settling up in respect to each acre, that is to say, when he has secured a ground rent of 6*l.* on eight houses, or 48*l.* in all, he is then entitled to a lease of a plot of land which with half the roads and houses already leased will comprise 1 acre. This is granted at a ground rent of 2*l.*, which is about the lowest amount which is worth collecting half-yearly, and which with the 6*l.* secured on each of the eight houses built amounts to the 50*l.* an acre as agreed. The lease of this remaining portion is what is generally called a "residue" or "remainder" lease.

The speculator has thus fourteen more plots on which he can secure 6*l.*, or if he cares to do it on this part of the land, the limitation of one-sixth of the rack-rental value not applying, a higher ground rent than one-sixth of the rack-rental value; but, of course, the higher the ground rent in proportion to the rack-rental value, the fewer the number of years' purchase which he can obtain for these so-called improved ground rents. Generally speaking, an improved or leasehold ground rent sells for about five years' purchase less than a similar freehold ground rent; they are, I believe, largely bought by insurance companies, whose methods of business easily enable them to set by the sinking fund necessary to compensate for a melting or terminable security. Thus, acre by acre, the whole of the 10 acres would be covered.

The profit on a transaction of this kind represents a substantial gross sum, but it has to be remembered that out of this profit the speculator has to recoup himself for his outlay upon roads; and in all probability, unless he is very fortunate, for losses on financing builders, the delay in getting the land covered, during which time he is standing out of interest on his roads; for the peppercorns which he has to grant to the builders, which, however, is partly or wholly covered by the peppercorns which he receives from his ground landlord; and for many other incidental expenses.

The whole question of profit or loss is entirely speculative. If everything goes right he probably makes a handsome profit, but if everything goes wrong he is just as likely to make a substantial loss.

The so-called peppercorn consists, of course, in a rising rent, and on a letting such as that under consideration, the terms would probably be:—

A grass rent for the first year; 100*l.* for the second year; 200*l.* for the third year; 300*l.* for the fourth year; 400*l.* for the fifth year; 500*l.* for the sixth and subsequent years of a 99 years' lease.

In cases where the freeholder makes the roads the *modus operandi* is very similar, the difference being that the ground rent is higher and the balance on the residue lease correspondingly smaller. In such a case as the foregoing, the builder would pay the ground rents as already set out with an addition in each case of 5 per cent. upon the cost of the roads, which may be taken for that class of property, at a rough approximation, at 300*l.* per acre, a figure, however, which it is only right to point out may vary considerably, because the larger the plots the less road-making is required per acre.

Where the ground landlord makes the roads there is this great advantage: he can then deal direct with the builders, and the profits of a middle man are entirely avoided; a better class of builders can be obtained, and these, by improving their ground rents in the manner already indicated, can obviously afford to sell their houses substantially cheaper than builders who pay the full rack-rental value and make no profit out of the land.

There is a third system which is adopted where the ground landlord is prepared to take risks, or where the developer is a speculator who has purchased the land, and that is, to make the roads and to let the land at practically its full value, making liberal advances to the builder as the work proceeds, and giving him some return either in the way of bonus or allowing him to improve upon his ground rent.

It is very desirable that surveyors who have to negotiate so many of these matters should have a general knowledge of the legal principles that are involved in the question of covenants which run with the land. These have been largely developed by lawyers in the last twenty years, and it is useless stipulating for provisions which in the end are held to be non-applicable because they do not run with the land. A general knowledge of covenants which run with the land and those which do not; of the difference between negative and affirmative covenants; of breaches which are continuing, and of those which are prejudiced by the acceptance of ground rent, and so on, are matters which surveyors are constantly being called upon to deal with, and with which, therefore, they should be familiar in a general way.

It is not possible in the limits of a short paper like this to enter upon them more largely. All of us, however, who have the subsequent management of building estates must be impressed with the greatly superior advantages of a lease as compared with the freehold in respect to the subsequent good management of a property.

As regards the laying out of estates, there are a number of points which are well worth consideration.

Road-making itself is a fairly simple matter, because the main lines of a specification are rigidly fixed by by-laws. Nearly every parish has its own pattern of man-holes, and there is very little that can be said of any value on the question of the actual construction.

Personally, I am in favour of making the roads to a high standard in the first place, but here I know there is great difference of opinion. A well-made road which will stand the wear and tear of building prevents an estate from getting into the horrible condition that is not uncommon in the course of the development of a building estate; and, moreover, the subsequent cost of making up by the local authority is substantially less. The increased cost makes itself felt, of course, in increased ground rent, but the difference is negligible, and the advantages in my opinion quite preponderate.

As regards the laying out of roads a few simple principles may be laid down.

First, it is better to have as many roads leading out of main roads as possible. This involves making the roads at right angles to the main roads instead of parallel, as is sometimes done, the parallel roads leading out of other roads which themselves lead out of the main roads.

Secondly, where possible it is better to have the roads running north and south. In that case, every room in every house gets the sun either morning or afternoon, whereas if the roads lie east and west, the rooms looking north never get the sun.

This is a counsel of perfection, and can only be achieved other things being equal; the shape of the estate, such inexorable barriers as railways, the levels of the land, and many other points have to be taken into consideration. Moreover, the position of the public main roads is already fixed and unalterable.

Thirdly, I for one cannot see the serious objection to what are generally called "cul de sacs," though why they should not be called by the equally expressive and more English phrase "dead ends" I do not know. One thing is certain; they are quiet, and quietness in a large town is an immense advantage.

The ideal to be aimed at in all cases is simplicity of planning, giving convenience of access and freedom from acute angles.

Generally speaking, it is better that roads should run down the slope than at right angles to it; where the slope is material, it is very difficult to get the drains from the backs of the houses on the lower side into the sewer in the road.

Our English streets leave much to be desired, but probably no cause has contributed more to this than cast-iron by-laws, which have much to answer for. There seems, however, to be a probability of a more reasonable attitude in this respect being adopted in the near future.

After the roads have been laid out, there are still questions of planning, because it is impossible to provide right angles to every plot.

There is one matter to which personally I have a great objection, and that is, that where there is an acute angle between two parallel roads and the main road we see sometimes the houses set back from the road in steps. This always appears to me to indicate poverty of ideas in planning.

Such is a brief outline of the methods by which the development of land for building has hitherto proceeded in this country.

Perhaps a paper of this kind may not be considered complete unless some reference is made to the revolution which must necessarily result from the special taxes which have been imposed upon this particular industry.

Its authors claim, I believe, that the Finance (1909-10) Act, 1910, will have the effect of stimulating building development. "The clouds we so much dread" may be "big with mercy," and "may break with blessings on our heads," or—they may not; but whatever they do it requires a strong effort of the imagination to see how these proposals can stimulate the development of land. They may, and it is reasonable to suppose they will make owners more than ever disposed to sell or to let, but the building developer will not be any more disposed either to buy or to hire; in all probability he will be quite the reverse.

It would not be becoming in this place to discuss the policy of these special taxes, but we, as surveyors who have to deal with the altered conditions, can very properly consider the nature of the alterations which have been made, and how they will affect our legitimate business.

The feature which appears to me to be of the most serious nature is the exclusion of interest on money paid for land and sunk in road-making and other ways, and I think it is not unfair to state the effect of these new taxes on the land developer as being an income tax at 4*s.* in the £ on an income which he does not receive.

Land development schemes may be roughly divided into three classes: (1) Those resulting in large profits; (2) those resulting in heavy losses (the files of the Bankruptcy Court contain abundant evidence of these); and (3) those resulting in a small profit or loss or neither.

Take as a typical instance of a land development scheme one resulting in neither profit nor loss.

	£
A seaside estate costs	15,000
There is expended on it in sea wall, sewerage, roads, water supply, and other items for which credit would be given under the Finance Act	40,000
Interest has to be paid to bankers during the course of development	37,000
	92,000
When the whole estate has been developed it is found that the proceeds of the sale of it amount to	92,000
Profit	Nil.

It will thus be seen that the result of twenty-six years' working is absolutely nil, which may be described as a disastrous result.

Let us now see how this is treated under the Finance Act:—

		£
Proceeds of sales		92,000
Under the Finance Act credit will be given for	£	
the original cost of the land	15,000	
10 per cent. would be allowed on this	1,500	
	16,500	
Credit capital expenditure as above	40,000	
		56,500
Theoretical increment subject to 20 per cent. duty		35,500
Increment duty payable		7,100
Plus undeveloped land tax in the meantime		—

It will thus be seen that on a transaction extending over the better part of a man's business life he not only has spent the whole of his time for no reward, but he is actually fined something between 7,100*l.* and 10,000*l.* for embarking in and carrying out a transaction which is not only a legitimate one, but which the authors of the Finance Act assert is so commendable that their measure will encourage it and similar transactions.

Now compare this with another transaction. A man buys an estate for 10,000*l.*, and sells it within three months for 11,000*l.*, which represents interest at the rate of 40 per cent. per annum. He entirely escapes increment duty. The purchaser in turn sells it to another man almost immediately at 1,000*l.* profit, and pays nothing in the way of increment duty; he again sells it for 1,000*l.* profit, but this time increment duty becomes payable, on no principle whatever except the purely arbitrary one that these 10 per cent. allowances must not exceed 25 per cent. in five years.

What is the inevitable result of such a system of taxation? Obviously, unless there is a certainty of enormous profits which can cover almost any demands, no prudent person would embark on a transaction requiring many years to work out, involving an enormous charge for interest in the meantime, and yet carrying with it the liability to taxation based upon the entirely false assumption that no such heavy liability as compound interest is to be taken into account. And yet this accumulating interest is the essence of such transactions as the Letchworth Garden City, and many seaside estates, and is a most important feature in all such transactions.

Building development is at all times an uncertain speculation, and it seems to me that unless some more common-sense view is taken of these matters it will be the height of indiscretion for anyone to undertake the development of more than an acre or two at a time.

Even the undeveloped land duty, which is justified as a means of bringing more land into the market, and so stimulating the supply of available building land, becomes, in the case of these estates requiring many years to work out, a most oppressive burden. Land which, as in the case above mentioned, is of comparatively little value, which requires a heavy initial outlay, and which becomes valuable only on account of the enterprise and large expenditure of its owners, becomes after twenty years liable to undeveloped land duty.

Great play has been made on political platforms with the fact that this undeveloped land duty is "only a halfpenny in the pound." But even a halfpenny in the pound may work out at temporary confiscation. Take the case of my seaside resort just referred to—land that may have been bought for 10*l.* an acre may have had so much money sunk in developing it that in order to get it back it may not show any profit if sold for 1,000*l.* per acre. It may be standing idle because its time has not come, and yet have to pay a tax of 2*l.* 1*s.* 8*d.* per acre because its owner has turned it from land worth 10*l.* per acre into land worth 1,000*l.* per acre.

Even if the 1,000*l.* per acre were yielding 4 per cent. per annum, a tax of a halfpenny in the pound on the capital value means an income tax of 1*s.* 0½*d.* in the pound; but as it yields nothing and cannot be made to yield anything until it is actually required for building, this tax cannot be regarded in such a case as anything but a tyrannous exercise of the power of the purse.

The object which the authors of the measure had in view is quite clear, viz., to prevent a man holding up his land for more than twenty years, and so only giving him relief on the ground of his expenditure for that period; but they either did not know, or had lost sight of, or were too obsessed with the "holding-up" bogey, or were too much in need of money, to have regard to the just claims of those who are engaged in these long-drawn-out transactions.

Wren Hoskyns in his "Chronicles of a Clay Land Farm" makes an acute observation that whereas many an excellent measure is rendered nugatory in its administration, so many a vicious measure is made tolerable in its administration. That is the substance, though not, perhaps, the *ipsissima verba* of what he says, and it is quite possible that in the administration of this Act its inconsistencies and offences against fair dealing may be so toned down as to render it more in accordance with what we are accustomed to regard as fair play. If so, it would be a matter of immense convenience to the land-developing class which it is desired to encourage if they knew how they were going to be treated in regard to these and many other similar problems. What hope there is for this consummation is at present beyond the wit of most of us to speculate.

The feeling that has inspired this measure no doubt had its origin first in a belief that enormous profits are made out of land speculations, and, secondly, that without any effort on the part of the lucky landowners their land greatly increases in value in the neighbourhood of large towns. The public eye is caught by such cases when they occur, but it is blind to the cases where heavy loss is the result. How many solicitors and surveyors have been ruined by land speculations.

Even among people who ought to know better one frequently hears the most extravagently sanguine estimates, as in the case of a witness who some time ago in my hearing gave evidence that certain land would be worth 1,000*l.* an acre when ripe for building. When asked how long that would be, he replied, "Probably in five years."

Now as this was land not well placed and three miles outside the London building fringe, and as London spreads at about the rate of one mile in twenty-five years as near as can be, it is obvious that the witness spoke without reflection. The five years have passed some time now, and the land to-day is worth less now than then. If an account could be taken of all the money invested in suburban land I venture to think the results would be not a little surprising to the optimistic. My own experience may be summed up in these words: "Never buy suburban land to look at."

OUR CONTEMPORARIES FROM OVERSEA.

THE *American Architect* (New York) devotes most of its illustrations to the First Congregational Church, Old Lyme, Connecticut, which has been rebuilt from the designs of Mr. Ernest Greene to reproduce as nearly as possible the appearance of the early nineteenth century building which was burnt down in July 1907. This old building was of wood. The new one is of steel and concrete, with an external casing of wood. Other illustrations are of architectural sculpture or carving by Mr. A. Stirling Calder.

Der Architekt (Vienna) contains a coloured plate of the design of Herren Beutinger & Steiner for a new bridge over the Rhine at Lauffen. The same architects are also represented by their design for a "dependance" at Bad Mergentheim. Professor Jan Kotera's charming addition to a villa at Bubenc, near Prag, is illustrated; also a school designed for Cronstadt by Rudolf Truska, and some tramway waiting kiosks by Christoph Ernst.

La Construction Moderne (Paris) describes the Château de Serrant and the Château de Brissac, and illustrates the latter and the Château de Montsoreau.

Deutsche Bauzeitung (Berlin) gives further description and illustrations, including plans, of the new town hospital at Rixdorf, near Buckow.

The *Western Architect* (Minneapolis) for this month is principally a monograph of the career of Mr. G. J. Eckel, "one of the oldest and most successful and respected practitioners of architecture in the Central Western States," and many of the buildings which he has designed, either alone or in conjunction with other architects, are illustrated.

Engineering Record (New York) contains a report of considerable interest by a committee representing the American Society for Testing Materials on a number of tests on paint for preserving steel. A description is given of the foundations of the Woolworth building, New York, which is intended to be the highest building in the world, 775 feet high above the street level.

ILLUSTRATIONS.

GIDEA PARK GARDEN SUBURB, ROMFORD.

WE illustrate some of the houses erected at Gidea Park from photographs by Mr. J. Halliday Borland.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

WE are pleased to be able to publish this week a further series of reproductions of sketches made on the A.A. excursion last month by Mr. Charles E. Bateman, President of the Birmingham Architectural Association.

THE Committee of the Galashiels Burns Memorial have accepted provisionally the design of Mr. F. W. Doyle Jones, of Chelsea, for the "Braw Lads" Memorial which it is intended to erect on a site at the foot of Lawyers Brae. The successful design provides for a memorial in the form of a bust of Burns, about 3 feet 3 inches in height and 1½ life size, cast in the finest bronze, and placed on an ornamental pedestal of dressed granite about 10 feet in height.

THE AGE OF STONE CIRCLES.

(Concluded from last week.)

THE deposits of silting must now be described, beginning at the bottom with the pure chalk rubble. This material was found, as in the other cuttings, to cover the whole of the solid faces of the fosse, and its accumulation must have been very rapid when the ditch fell into neglect. Relics found in this deposit would probably all belong to the first decade or so following the disuse of the monument. This silting was no doubt the result of natural causes, *i.e.*, the scaling of the profile of the fosse in frosty and rainy weather, and the falling down of material forming the embankment, which in all probability was not at that time turf-clad. Comparatively small quantities of turf and mould would, in the course of construction, be thrown up with the chalk to form the great vallum, and the occasional fall of the dark mould from the bank would be sufficient to account for the concave streaks, or seams, in the chalk rubble of the fosse, which were even better defined in the 1911 section than in the cuttings previously made. The lowest seam of mould, which extended right across the cutting in one part, reached at the point of greatest concavity to within five feet of the bottom of the fosse. The three seams on the south side of the silting were, for a length of several feet, exceptionally noticeable. On the eastern margin the depth of chalk rubble in the middle of the fosse was ten feet. This rubble was very large at about 2.5 feet from the bottom, especially in the middle of the ditch, but it became rather smaller again on the bottom. Pieces of iron pyrites were commonly found in the rubble, but very little flint was observed, and most of the pieces were very small. Fragments of charcoal were occasionally met with. At the top of this deposit the lumps of chalk were found cemented together, no doubt by means of carbonate of lime contained in water which had percolated through the upper silting, consolidating the chalk and rendering it as durable as the hardest concrete. Its thickness was perhaps hardly as great as in Cuttings I. and II. of former years.

The upper deposits of silting consisted, from the top downwards, as in the other cuttings, of (1) turf and turf-mould; (2) surface silting; (3) mixed silting, and (4) fine mixed silting, their thickness on the eastern margin being, in the middle of the accumulation, 0.65, 3.35, 2.7, and 2 feet respectively. This gives a total depth of silting above the chalk rubble of 8.7 feet. On the western margin, where the fosse was shallower, these deposits were represented by a thickness of 7.7 feet. Dividing the surface silting from the mixed silting was a thin seam of small pieces of chalk which was traced nearly the whole way along the cutting. So much has been said in the former reports on these deposits that it will be unnecessary to make repetition here.

Above the chalk rubble two distinct patches (not seams extending across the cutting) of dark mould and very fine chalk were traced, the lower one practically throughout the length of the digging. The higher patch was at an average depth of 5 feet, the other about 7.2 feet, below the surface, in what are called the "mixed silting" and the "fine mixed silting" respectively. Maximum thickness of each, 0.6 foot. Evidence of fire was distinctly traceable, and charcoal in small pieces was observed in both deposits. In the lower patch a piece of the burr of a small red-deer antler, a bit of burnt bone, and fragmentary animal remains were found, and the charcoal included remains of beech (identified by Mr. Clement Reid); the objects described later under No. 160 were also collected from the same material. The prehistoric pottery, No. 167, was found in the upper deposit of burnt material. It is a question if these deposits do not indicate some sort of occupation when the fosse had silted up to these respective levels.

IV. *Relics found in Cutting VIII., Fosse.*

147, 148, 150, 151. Fragments of rims, &c., of glazed and unglazed mediæval pottery. Depths from 2.2 to 2.6 feet in the surface silting. (Several other pieces of mediæval pottery were found, but only the best samples preserved).

149. Two small tines of deer (in poor preservation). Depth six feet in the mixed silting.

152. Fragment of soft New Forest ware, painted and slightly ornamented; Roman. Depth 4.2 feet near the top of the mixed silting.

153. Fragment of brown pottery, Romano-British. Found as No. 152.

154. Finely chipped flint knife, of plano-convex section, worked on the convex face only and along both edges; the butt-end shows the outer crust of the flint core from which the implement was struck; length 61 mm., maximum width 30 mm., maximum thickness 8.5 mm. It was badly fractured by being struck by an iron pick, but has been neatly repaired. Depth 5.7 feet in the mixed silting.

155. Two fragments of light brown pottery, Romano-British. Depth 4.3 feet near the top of the mixed silting.

156. Small iron cleat (for shoe or sandal); length 22 mm., with narrow base (width 7.5 mm.) and the usual projecting points for attachment. Depth 4.7 feet in the mixed silting.

157. Two fragments of mediæval pottery, with band of ornament. Depth 3 feet in the surface silting.

158. Fragment of brown pottery, with faint striations. Romano-British. Depth 4.5 feet in the mixed silting.

159. Flat and rounded disc of sandstone. Depth 6.8 feet in the chalk rubble.

160. Part of the beam of a shed antler of red-deer, with burr, brow- and bez-tines complete; unworked. Depth 7 feet in the fine mixed silting in a patch of burnt material. Close to the antler were found part of a dog's jaw and a boar's tusk.

161. Greater part of the rim and sides of a black earthenware saucer, Romano-British. It cannot be completely restored. The fragments were found strewn over a considerable area. Depth 3.5 feet in the mixed silting.

162. Bronze fibula, Roman, having a semi-circular bow of plano-convex section, the rounded upper surface being ornamented longitudinally by a beaded pattern of the character usual in brooches of this type; the nose, consisting of a rounded knob, appears to have been broken and replaced by a knob of a different metal; the pin is hinged, with an iron axis; the head of the bow terminates in a plate bearing the inscription AVCISSA (unfortunately the initial A has been broken off); length 49.5 mm. Found near the western margin of the cutting, depth 3.9 feet at the top of the mixed silting. (There is no doubt about the finding of the brooch in this position, as it was discovered by the writer.)

163. Six small fragments of coarse, hand-made, badly baked pre-historic pottery, ornamented on the external surface by lines of twisted cord pattern and finger-nail marks. Also a straight rim fragment, of similar character, ornamented externally by four parallel lines of twisted cord pattern, and internally by a single row of the same, below which there is a row of deep finger-nail marks. Depth 5.8 feet near the bottom of the mixed silting.

164. Straight piece of red-deer antler, apparently unworked; length 6⅛ inches. Depth 8 feet in the middle of the fosse near the bottom of the mixed silting.

165. Greater part of a large rib-bone, probably of ox, with rough, slightly incised, longitudinal scoring. Found resting on the floor of the fosse.

166. Hollow-scraper, or arrow-shafter, of flint. Depth 4.6 feet in the mixed silting.

167. A large number of fragments of hand-made prehistoric pottery, the largest piece, after repair, measuring about 2½ by 2¾ inches; maximum thickness, ½ inch. The fragments were distributed over two or three feet of ground in burnt material, and seeing the importance of the "find" after the first piece or two had been collected, the writer obtained a sieve through which all the surrounding material was passed. This pottery has not yet been microscopically examined, but the ware is coarse internally, the surfaces being carefully finished to receive impressed ornament; black on the inner surface, a light reddish-brown on the outside. At about 43 mm. below the almost straight rim there is a decided shoulder or ridge encircling the vessel with a hollow moulding below it. The ornamentation between the top of the rim and the shoulder consists of a double row of herring-bone pattern impressed before baking, by means of a notched implement of wood, bone, or antler, or perhaps by a piece of shell having natural ribbing. Below the shoulder there is similar ornament, but owing to the fragmentary state of the portion of the vessel remaining, it is impossible to say how far this style of decoration extended in the direction of the bottom of the pot. With the pottery were found three flint flakes (one with secondary chipping), pieces of burnt iron pyrites and very small bits of burnt bone. Found in the mixed silting, depth five feet in the western half of the cutting.

168. Small piece of coarse hand-made prehistoric pottery, containing grains of quartz; described as of the Bronze Age type in the former reports. Depth 14 feet in the chalk rubble.

169. Part of a human humerus, and the greater portion of a human tibia (both from the left side of the body). The tibia is of small size and the following measurements can be obtained:—Antero-posterior diameter 30 mm., transverse

diameter of the shaft 21 mm., latitudinal index 700. Depth 4.5 feet in the mixed silting.

170. Complete shed antler of red-deer, of medium size, the brow- and bez-tines broken off; total length in a direct line 22 inches. There is no evidence of its having been used as an implement. Found on the floor of the fosse near the south margin.

171. Rib-bone of an animal (smaller than ox), cut to a rounded termination at one end, where it is very smooth and slightly bevelled from one side. Found on the floor of the eastern half of the fosse, against the north face.

172. Crown of an antler of red-deer, with three points or surroyals, which bear evidence of some wear, and may have been used as a rake. Found on the bottom of the fosse near No. 171.

173. Fragment of the base of an antler of roe-deer. Depth five feet in the mixed silting.

174. Small antler of a very young red-deer. Depth 5.5 feet in the mixed silting.

175. Broken pick of shed red-deer antler; the bez- and trez-tines removed, the brow-tine broken; evidence of hammering is seen on the back of the burr. Depth 14.8 feet in the chalk rubble, near the floor and close to the western margin of the cutting.

176. Broken pick formed from a shed antler of a large red-deer; maximum circumference of the beam between the two lower tines, 161 mm.; the brow-tine has its point missing; considerable evidence of hammering is seen on the back of the burr. Also part of a rib-bone, probably of ox. Found on the bottom of the fosse on the west margin of the cutting.

A few other fragmentary animal bones were found on the bottom of the fosse, among which pig was identified.

Flint flakes were perhaps not quite so numerous as in Cuttings I. and II. (1908-9).

Some of the wood specimens, animal remains and shells have not yet been examined.

V. *General Remarks on the Relics discovered.*

In the last chapter it is shown that no fragment of mediæval pottery was found at a greater depth than three feet, and that all were situated well within the deposit called "surface silting." The objects and pottery of the Roman period were all found between the depths of 3.5 feet and 4.5 feet in the upper part of the "mixed silting." In the lower part of that deposit the flint knife, No. 154, was found at a depth of 5.7 feet, the hollow scraper of flint, No. 166, depth 4.6 feet, and the prehistoric pottery, Nos. 163 and 167, already described, depth 5.8 feet and five feet respectively. It is seen, then, that the lowest object of the Roman period and the highest pieces of prehistoric pottery were in relative levels, only six inches apart. Passing to the "fine mixed silting," nothing was obtained but unworked pieces of red-deer and roe-deer antler. In the lowest deposit, the "chalk rubble," a small fragment of prehistoric pottery was found at a depth of 14 feet, a broken antler pick at a depth of 14.8 feet, another on the bottom, a worked rib-bone also on the floor, and a complete red-deer antler and the crown of another in the same position. This season we found no traces of worn animals' scapulæ on the bottom of the fosse, but in 1909 we obtained convincing proof that these bones were, with slight alteration, used as shovels for removing loose chalk.

There are no special remarks to be made on the mediæval or Roman pottery shards. The small cleat is an object of frequent occurrence in Romano-British deposits, and its use as portion of the iron furniture of sandals, or shoe leather, is proved by the discovery of specimens, with a quantity of hobnails, at the feet of skeletons at Rotherley and Bokerly Dyke. A specimen was found on the old surface line under the rampart of the Wansdyke, a few miles south of Avebury.

The Roman brooch, or fibula, No. 162, already described as bearing the maker's name, AVCISSA, is a personal ornament of very definite type and date (first half the first century, A.D.); and it adds one specimen more to the short list of brooches bearing this inscription found in England. A similar fibula with the same lettering was found in the parish of Marlborough last year, and is here placed on record for the first time; it may be seen in the collection of Mr. J. W. Brooke of that town. Recently the writer recorded and figured a similar brooch (with the S's reversed) found on Ham Hill, South Somerset. Two other examples come from the same county and were found about 1875 in the Roman lead-workings at Charterhouse-on-Mendip (Bristol Museum). Two others were found at Cirencester (one is in the Bathurst Museum, the other in the Cripps Museum). A large collection of Roman remains bought for Hull Museum in 1905 included two "Aucissa" fibulæ, found presumably in a Roman cemetery at South Ferriby, Lincolnshire. Professor L. Haverfield had up to 1905 recorded twenty-eight fibulæ bearing his name, of which six were then known from England; the Ham Hill, Marlborough and Avebury examples have now been added to the list. The type, without inscription, is not rare, and has been found commonly in many parts of the Roman Empire north of the Mediterranean, and outside it, including the Caucasus and Tomsk in Siberia.

The finely chipped flint knife, No. 154, already described, has every appearance of great age, and is of typical Neolithic form. It is similar in shape to the knife found by Canon Greenwell in a barrow on Wykeham Moor, Yorkshire, but smaller.

Perhaps the most important discovery made this season is that of prehistoric pottery, Nos. 163 and 167 (previously described in detail), found at depths of only 5.8 feet and five feet respectively below the surface of the silting. The presence of ornament of a definite type renders them the easier of identification. Sufficient remains of the rim and sides of No. 167 to identify the typical "shoulder," with hollow moulding below it, but unfortunately there are no fragments of bottom, and therefore it is impossible to say whether the vessels had round or flat bases. The upper part of the vessels may be described as having straight rims with a slight bevelling of the lips on both sides. The rim piece, No. 163, with twisted cord pattern on the external surface, can be matched exactly by a fragment of pottery (not figured) found in the West Kennet Long-barrow, and now in the British Museum.

The pattern on the several fragments comprising No. 167 has already been described, and it only remains to say here that the ornamentation is of the same kind as that which embellishes the well-known pieces of pottery found in the Long-barrow at West Kennet, near Avebury, of which a few fragments may be seen in the British Museum, and a larger series in Devizes Museum. One of these fragments with the grooved herring-bone design, the depressions being ornamented by transverse notches, has frequently been figured as a specimen of Stone Age pottery.

Ornament precisely similar to that on the Avebury fragments (No. 167) is seen on the Neolithic bowls from Peterborough and the Thames at Mortlake (but the ribbing across the grooves is not clear in the latter specimen). Similar decoration is also seen on a fragment of prehistoric pottery found in association with Roman remains only 1.1 feet deep in the silting of the ditch of Wor Barrow (long-barrow), Handley, Dorset. Its position in the ditch was of no datable value, and the fragment must have been mixed with the soil when deposited in the position in which it was found. Two round barrows near Handley also produced prehistoric pottery bearing the same type of ornament as these Avebury shards. That in the first barrow was found at a depth of one foot on the chalk floor; the mound was small, with encircling ditch, outside which no less than fifty-two cremated interments were discovered. That in the second was found in the body of the mound, depth 1.8 feet. These fragments were probably in the soil originally thrown up to form the barrows, and as Neolithic man is known to have used Handley Downs for funereal purposes, there was every likelihood of Neolithic shards becoming scattered in the neighbourhood. This is mentioned because General Pitt-Rivers says in regard to this ware, that, in spite of the West Kennet pottery being assumed to be of the Stone Age, the fragments from Handley bearing similar decoration were without doubt associated with relics of the Bronze Age. He inclined to the conclusion, therefore, that the pottery in question was referable to the Bronze Age.

But the study of prehistoric pottery has developed considerably even since the General's time, and although the *gisement* of shards of ancient pottery (upon which one's conclusions are partly based) is of the highest importance in archæological excavations, single pottery fragments of earlier date, in a locality successively occupied by tribes from and including the Stone Age, must occasionally have become mixed with relics of later times, and especially in localities frequented by burrowing animals.

The writer is inclined on the whole to regard these pottery fragments, Nos. 163 and 167, as being of Neolithic date, and it is possible that some of the unornamented fragments described as being of Bronze Age type in the former Reports may really belong to the Stone Age. At the same time it should be pointed out that no pottery of the drinking-vessel, or beaker, type has yet been discovered at Avebury; and it should also be repeated that only six inches of silting divided the lowest object of Roman date found from the prehistoric pottery discovered nearest the surface.

A small fragment of pottery belonging to No. 163 was sent to Mr. Clement Reid for close examination, and he has kindly sent the following interesting report:—

"The 'grout,' or coarse material used for stiffening this pottery and making it keep its shape when burnt in an open fire, is of unusual composition. It consists mainly of fragments of burnt bone, with a few minute bits of charcoal. I think that ashes of a fire have been used, as being grit that would not fly, shrink, or burn out when the pottery was fired; there are also one or two small fragments of flint. The clay with which this 'grout' was mixed seems to have been a coarse sandy clay with large rounded grains of quartz. Probably the so-called 'clay-with-flints' so common on the chalk-downs was used. As far as one can judge from so small a sample, only enough clay was used to bind the material."

VI. *Concluding Remarks.*

From the detailed description of the relics discovered in Cutting VIII., and on reference to the former Reports, it will be seen that the objects found this year are more important with regard to the much debated subject, "the date of Avebury," than those discovered previously. The strong negative evidence of date afforded by the absence of metals below the Roman stratum of silting has now been greatly strengthened by the discovery of prehistoric pottery of a well-known kind—a type which has been associated with Long-barrows and such early settlements as the prehistoric pits at Peterborough.

All the objects discovered in the lower half of the mixed silting, in the fine mixed silting, and in the chalk rubble are such as are characteristic of the Neolithic period, and we have decidedly less hesitation in regarding the fosse of Avebury as being of Neolithic construction than we had at the close of the excavations of 1909. The relics discovered have not been numerous, but considering the early date and the great extent of Avebury, and the comparatively small area yet excavated the most optimistic antiquary could hardly have expected to find a greater variety of objects in the prehistoric area than pottery with characteristic ornament; flint knives and scrapers, and flakes with secondary chipping; picks, hammers, levers, and other implements of antler; bone shovels, and other bones more or less worked.

We have proved much, but have yet a good deal to learn with regard to the mode of construction of Avebury, and the methods adopted in excavating the stupendous fosse and aising the great vallum.

It will be a great disappointment if a means cannot be ound to make an adequate examination of the southern ntrance-causeway of Avebury and the items of structural nterest adjoining it, and a serious hindrance to archæological esearch and to the endeavour to piece together the history of Britain's greatest prehistoric stone monument.

BUILT-UP COLUMNS UNDER LOAD.

(*Concluded from page* 125.)

THE main points brought out in the preceding discussion may be recapitulated as follows:—

1. The practicability of making tests to determine the ctual stresses which are developed under working loads and p to the elastic limit of the material in the members of a olumn, throughout its length and over its cross-section, has een shown. The results significantly point to the importance of making investigations of this kind. The experiental work involved is tedious and laborious, and, of ourse, the work requires skilled and experienced experienters. The need of such information has been recognised eretofore, but tests have not been taken up because of the upposed impracticability.

2. An important result of the tests is the evidence that nsiderable local flexural action exists in the channel members of the columns, such as may be produced by lack of raightness or by any method of applying the load eccentrilly. This is especially true in the flimsier column.

3. The condition of flexure varies markedly throughout e length of the channel member, in some cases the maximum mpression in one cross-section being at the extreme fibre on e side of the channel, and in a near-by section the other de of the channel showing the excess of stress.

4. There were also indications of sudden changes in the lative amount of stress carried by the two channels at ear-by sections, indicating general flexure of the column.

5. The measurements made indicate in a number of cases stresses in the extreme fibre from 40 per cent. to 50 per cent. in excess of the average stress, and in some cases even higher.

6. The amount of eccentricity necessary to account for the increase of stress found in individual channels, based on lack of straightness and the ordinary theory of flexure, is relatively small.

7. The amount of deformation observed in lattice bars is relatively small, and its variation throughout the length of the column is quite irregular. The measurements indicate a stress in the lattice bars which would be produced by a transverse shear equal in amount to 1 per cent. to 3 per cent. of the applied compression load, or to that produced by a concentrated transverse load at the middle of the column length equal to 2 per cent. to 6 per cent. of the compression load. The stress referred to is the average stress over the section of the lattice bar.

8. It seems futile to attempt to determine the stresses which may be expected in column lacing for central loading by analysis based on theoretical considerations or on data now available.

9. When the column was tested as a beam, the extreme fibre stress in lattice bars in compression was found to be from 1.4 to 5.5 times the average stress over the cross-section of the lattice bars, and the extreme fibre stress in lattice bars in tension was found to be 1.7 to 3.2 times the average stress.

10. Tests of individual lattice bars for load-carrying capacity under conditions which resemble those of service show that the usual form of bar is a very inefficient compression member when loaded eccentrically through a riveted connection. The ultimate strength was in no case as much as one-half of the yield point of the material.

11. The formula

$$\frac{P}{A} = 21{,}400 - 45\frac{l}{r},$$

represents fairly well the ultimate strength of the flat lattice bars tested, based on material having a yield point of 40,000 lb. per square inch.

12. It seems evident that the component members of a built-up column do not act together in such a way as to give entire integrity of cross-section in resisting bending.

13. The distribution of stress under working loads, and even up to incipient failure, may be different from that which exists after the column becomes crippled. This is due to the yielding of the more strained parts after the yield point is reached at any fibre, and a consequent redistribution of stress.

14. The sudden failure of a test column at a relatively low load by buckling of the lattice bars is accounted for when the amount of transverse shear developed in other test columns and the strength of lacing found in lattice-bar tests are taken into consideration.

15. No relation has been found between the stresses actually observed and the stresses computed by column formulas. The stresses do not increase toward the middle of the length of the column, as may be expected from the Rankine form of analysis, but are quite irregular in their location and distribution.

16. Much of the excess of extreme fibre stress over average stress is evidently attributable to local crookedness of piece, eccentricity of bearing of lattice bar connection, lack of rigidity of lacing, and other irregularities that are due to the condition of the material and its fabrication, and what may be considered to be inherent variations and defects in the constructed compression piece. Within the elastic limit of the material and for the lengths most commonly used the lateral flexure of the column as a whole is very slight, and slenderness ratio cannot be said to be the governing consideration. Undoubtedly, the chances for variations from the ideal column will become greater as the column length becomes greater, and these variations may have a more marked effect upon its strength.

17. It is evident that the form of section is important. Stocky and stiff component members are less liable to receive kinks, bends, and distortions during and after fabrication, and will resist the effect of such imperfections with less resulting stress than will flimsy pieces. Some column sections are well calculated to resist bending, buckling, and twisting, and are so tied together as to preserve integrity of section, while others have less resistance to general distortion. Even the wrinkling action in plates and thin parts needs consideration. It seems reasonable that, for columns of the same length and containing the same amount of metal (within the ordinary dimensions), one which is of stocky form and in which the metal is distributed so as to resist local flexural

and torsional action will be stronger and more satisfactory than a column of more flimsy form, which has its metal spread in thinner sections, even though the slenderness ratio, $\frac{l}{r}$, of the former may be considerably more than that of the latter. Further, a section which will come through the shop and erection processes with the least imperfections has advantages.

18. This field of investigation is a promising one, and its importance to the engineering profession warrants its being taken up in a thorough and comprehensive manner. Full information on many matters is needed before better and more nearly satisfactory column formulas may be established.

INSTRUCTION IN STRUCTURAL ENGINEERING AND REINFORCED CONCRETE.

Up till recently no adequate course of instruction was available for students of reinforced concrete, but last winter the deficiency was repaired by the establishment of classes in this subject at the London County Council School of Building, Ferndale Road, Brixton, S.W., the lecturer being Mr. H. Kempton Dyson, the Secretary of the Concrete Institute. The course was a very complete one, and the demand for such instruction resulted in a large attendance and necessitated an extension of the scheme, an elementary theory class being formed and two assistant teachers appointed. As the result of the experience last session the scheme of instruction has been again extended, and the scope enlarged for next session, which commences on September 18. Although the London County Council made a special grant for the purchase of urgently needed apparatus and tools for practical instruction, goods were only received late in the session, but this year many more testing appliances, tools, &c., have been added, and a more systematised course of instruction will be possible this session. Though the subject of reinforced concrete is taught in many places abroad, the course at the School of Building is distinctive in respect to the great feature made of practical work, which is of the utmost importance to a knowledge of theory and the proper execution of the work. Those who seek to design work are required to take both the practical and theoretical instruction, but the practical part is so arranged that it can be taken independently by builders, clerks of works, foremen, craftsmen, and others who only wish to study this aspect. It is to be hoped that the practical workers will avail themselves of the opportunity, for there is a most regrettable ignorance of the proper methods of carrying out concrete work displayed in building work in this country. As an outcome of the establishment of this class for reinforced concrete, the need was ascertained of a more extended field of operations. Reinforced concrete design is a branch of structural engineering, and for its proper study requires a knowledge of applied mechanics and the design of various kinds and parts of structures. Structural engineering is becoming a specialised subject, and therefore this session a complete course of instruction therein has been framed extending over four years, in which various other classes at the school have been utilised in the preliminary stages, and the opportunity will be taken in giving the necessary instruction in the principles of structural design to show their application to all constructive materials. This while a necessary part of reinforced concrete instruction is to be so arranged as to appeal to those who desire to obtain a knowledge of higher theory of structures. This branch also will be distinctive because the practical design of structures will be demonstrated, including such subjects, for instance, as heavy timberwork, bins, foundations, piles, reservoirs, tanks, pipes, culverts, bridges, statically indeterminate structures, fire-resisting construction, architectural acoustics, &c. The last two named are specially noteworthy, and the lecturer will impart much original information. To supplement the foregoing a class will be formed to give practice in the drawing and design of structures in reinforced concrete and steel. This class will be conducted on the lines of a drawing office.

The full scheme is as follows:—

Elementary Course.—(1) Reinforced concrete construction, quantities, and practical work—Mondays; (2) Reinforced concrete, theory and design—Tuesdays; (3) Drawing and design of the constructional steelwork of buildings—Wednesdays.

Advanced Course.—(1) Structural design—Wednesdays; (2) Reinforced concrete, theory and design—Tuesdays; (3) Drawing and design of reinforced concrete and steelwork—Fridays.

The time will be 7 to 9 p.m., and the session lasts about thirty weeks. The detailed syllabus can be obtained free on application at the School. The fees are very moderate, being 10*s.* per session (and in special cases 4*s.* 6*d.*).

THE ANCIENT FRESCOES AT CHICHEN ITZA.

A communication presented to the British Association at the Portsmouth meeting, 1911. By Miss A. C. Breton.

The ruins of Chichen Itza in Yucatan are amongst the most important in Central America, being especially remarkable for the number of coloured portrait sculptures and frescoed walls. The frescoes have been sadly destroyed in the course of centuries, but enough remain to provide striking pictures of the life of the ancient folk. In two of the upper rooms of the building called the Nuns' Palace, the walls and vaulted ceiling were entirely covered with scenes which had backgrounds with thatched houses and trees, also temples with high-pitched roofs enclosed within battlemented walls. There were groups of warriors armed with spears, *atlatls* (throwing sticks), and round shields, and others seated on the ground, with ornamental tails hanging from their girdles. The drawing was firm and spirited, the colouring vivid and harmonious.

Stephens observed a row of Maya glyphs painted just below the vaulting in the interior of the small building known as the Iglesia, but they have disappeared, and there are n signs of any glyphs among the paintings at Chichen Itza. The chambers of the Akaboib have been whitewashed i modern times, and only a blue band along the edge of the vault is now visible. In the narrow corridor of the Caracol too, very little colour is left.

The building at the south end of the eastern wall of the great Ball Court, usually called Temple of the Tigers, contains in its upper part the best-preserved paintings yet discovered. The outer chamber having been filled with débris owing to the fall of the roof when the wooden lintels gave way, the inner chamber also became partly blocked and difficult of access, until Dr. Le Plongeon in 1884 cleared away most of the accumulated material, and partly copied the paintings in it. Visitors wrote their names over the frescoes, bats lived at one end, swallows at the other, and bees made tunnels in the plaster. Still it has been possible t secure many of the details and to give some idea of the composition. The chamber is about twenty-six feet long, and not quite eight feet wide, and twenty-two feet high to the top of the vault, with the door in the middle of the long western side. Each of the long sides is divided into three panels, of which the four end ones represent landscapes full of armed warriors, as do those of the north and south sides with houses above, and tents and temporary buildings below where chiefs are consulting and priests perform rites o divination. These panels are divided by a blue band from dado with mythological figures and plants.

The south-west end is the most complete, and has abou 120 figures, almost all of them placed at certain distances and angles from each other. These distances were measured from the point where the nose of each figure appears above the shield, and form the basis of the composition. The position of the shields fixed, the artist then drew the figures according to his fancy, and no two are alike. In this scene the attacking party are distinguished from the defenders o the village above by a difference in costume. The former have cotton knee and ankle bands, small green shields a their backs with hanging streamers, and round green earrings and necklaces. Their headdresses, surmounted by lon feathers, are more elaborate than those of the villagers. Th latter have a round, stiff headpiece with two or three blu feathers standing up from it, oblong ear ornaments whic pass through the elongated lobes, white shirts and roun shields, usually with a crescent in the centre as device. Al cast their spears from *atlatls*. The chiefs, who sit in consultation below, have feather mantles like those of the portrait statues which supported the sculptured table in th outer chamber.

The narrow south end panel also has a scene of attack with high scaffold towers and a ladder of a notched tree trunk, on which some of the assailants are perched. Her the men are taller and more athletic than in the previou scene. In the following panel there are more importan houses, forming a town, with a forest on both sides, in whic are animals, snakes and birds. Beyond come the Red Hill on which wilder figures are grouped, with rocks and tree below. The north end is much destroyed, but some personages on a background of blue sky may represent departed heroes. The shields in this are oblong. The last of these scenes shows a group of houses inside a defensive barrier, and blue warriors in feather cloaks have conquered the inhabitants. Above the door a life-size recumbent figure may be the hero in whose honour the building was erected.

SMOKE ABATEMENT.

A COMMUNICATION presented to the British Association at the Portsmouth meeting, 1911, by Dr. J. S. Owens.

FROM the point of view of smoke emission the present position of the manufacturer who burns bituminous coal in his furnace is that, while he knows dense smoke to be unnecessary and wasteful, entire absence of smoke is practically impossible to attain under working conditions. The question therefore is, What is the least amount of smoke such a manufacturer might be asked to limit himself to?

The present legal standard of "black smoke in sufficient quantity to be a nuisance" is admittedly unsatisfactory, as black smoke is a thing rarely if ever seen; also, the blackness alone is no measure of the amount of pollution nor even of the amount of soot per ton of coal burnt. The present standard is therefore out of date. Meanwhile the public have to breathe polluted air, to suffer in health and pocket, have their buildings injured and disfigured, and their sunshine cut off.

A sound standard of maximum allowable amount of smoke should be fixed and enforced. Two questions must be answered before such a standard can be fixed: (1) What is the best and most practicable method of measuring smoke? (2) Having decided on (1), what is a fair maximum of smoke emission to fix, as measured by (1)?

To answer the first question we must decide exactly *what* we are to measure. We may set ourselves to find out: (1) The total quantity of soot emitted in a given time; (2) the weight of soot emitted as a percentage of fuel burnt; (3) the density or weight of soot per unit volume of flue gas; (4) the ratio only of density to a standard; (5) the colour; (6) the opacity or blackness.

In deciding the method of measuring we must keep in view: (*a*) Fair comparison between chimney and chimney or with standard; (*b*) ease of application and simplicity; (*c*) reasonable accuracy; (*d*) the smoke must be measured from outside factory; (*e*) the method must be capable of use by a single observer.

The standard suggested is one of *maximum density for maximum time of emission.* By density is meant amount of soot per unit volume of flue gas. A smoke of great density would be permitted for a short time only, whereas one of less density might be permitted for a longer time.

The method of measuring the density suggested is by matching the opacity of the smoke to that of calibrated smoked glasses, each glass representing a certain density of smoke in a column of unit thickness, the final figure for comparison being obtained by dividing the density represented by the glass by the diameter of the chimney. By careful construction and the elimination of certain errors an instrument can thus be made to give a fair basis of comparison with a standard density. The author has devised and experimented with an instrument of this type, with promising results. Certain objections will always remain to such a method of measuring, but the author believes that it is only along such lines that the necessary conditions can be fulfilled.

The Alkalies Act of 1906 fixes a standard maximum of one-fifth of a grain of muriatic acid per cubic foot in smoke or noxious fumes, and it appears that the time has arrived when the soot from furnaces should be dealt with on similar lines, modified to suit the case.

THE tenth International Art Exhibition organised by the Municipal Council of the City of Venice will be held from April 15 to October 31, 1912. It will contain pictures, sculptures, drawings, engravings, and works of decorative art.

THE Library and Technical Instruction Committee of the Belfast Corporation have decided to purchase a number of pictures for the proposed new Belfast Art Gallery. Their selection of works is guided by the following Committee of the Contemporary Arts Society: The Earl of Plymouth, Lord Ribblesdale, Mr. D. S. M'Coll, Keeper of the Wallace Collection; Mr. C. J. Holmes, Keeper of the National Portrait Gallery; Mr. Campbell Dodgson, of the Print Room, British Museum; Mr. Charles Aitken, of the Tate Gallery, and others.

PETROL AIR GAS.

(*Concluded from page* 120.)

IN practice we usually know the composition of a mixture in the form of a certain weight of petrol evaporated into a certain volume of air, hence we require for convenience a formula which will give us the vapour pressure directly from these data.

Suppose our mixture consists of 1 kg. of vapour to V cubic metres of air measured at t° C. and 760 m/m, and we want to know the vapour pressure p.

From (1) any mixture in which the pressure of the vapour is p contains

$\frac{p}{760}$ cubic metres of vapour to $\frac{760-p}{760}$ cubic metres air

i.e. if d is the weight in kgs. of one cubic metre of vapour

$\frac{pd}{760}$ kg. vapour to $\frac{760-p}{760}$ cubic metres of air.

i.e. 1 kg. vapour to $\frac{760-p}{pd}$ cubic metres air.

and if V is the volume of air evaporating 1 kg. of petrol in this case, then $V=\frac{760-p}{pd}$

from which $p=\frac{760}{1+Vd}$ ………… (2)

or expressed in English units

$$p=\frac{760}{1+\frac{V}{F}} \quad \text{…………} \quad (3)$$

where V = cubic feet of air evaporating one gallon of spirit and F = cubic feet of vapour given by one gallon of the spirit.

For example, for the complete combustion of hexane as given by the formula $2\ C_6H_{14}+19\ O_2=12\ CO_2+14\ H_2O$:—

2×86 kg. of spirit require $19\times 22{\cdot}4\times 4{\cdot}81$ cubic metres of air at 0° C. and 760 m/m, *i.e.* 11·9 cubic metres of air per kg. of spirit. The density of hexane vapour is

$$\frac{86}{22{\cdot}4}=3{\cdot}84 \text{ kg. per cubic metre.}$$

From equation (3) we get

$$p=\frac{760}{1+11{\cdot}9\times 3{\cdot}84}=16{\cdot}3 \text{ m/m.}$$

and such a mixture should not deposit any vapour until a temperature of −18° C. is reached.

As we often want to know what is the percentage composition of a mixture formed by evaporating a certain weight of petrol into a certain volume of air the following formula may be of value. It is obtained by substituting the value of p in equation (2) in equation (1), from which we get

$$\text{Vols. per cent.}=\frac{100}{1+Vd} \quad \text{……..} \quad (4)$$

or in English units with the same notation as before,

$$\text{Vols. per cent.}=\frac{100}{\frac{1+V}{1=F}} \quad \text{……..} \quad (5)$$

As has been previously pointed out, if we wish to employ a gas which is not explosive in the apparatus it must contain, say, 6 per cent. of vapour. In a 6 per cent. mixture the vapour pressure is $\frac{6}{100}\times 760=45{\cdot}6$ m/m,

and if this vapour is hexane, from the vapour pressure curve we see that it would be saturated at freezing point. The experimental figure of 5 per cent. for the upper limit of combustibility, however, given above, refers to petrol (*i.e.*, a mixture of several hydrocarbons).

The author made some experiments on condensation with a 6 per cent. gas made from Anglo-Special spirit of sp. gr. 0·680, and found that at 0° C. there was a faint deposit (a dew-point instrument had to be employed to indicate this), but that the gas could be run through a coil of pipe kept at −10° C. by a freezing mixture without a deposit of any appreciable magnitude; in fact, the gas was kept burning in a Bunsen burner for some hours with the coil at this temperature. The small quantity that was condensed had quite a different smell from that usually associated with petrol and was very heavy, having a sp. gr. of about 0·760. This latter figure was very difficult to determine owing to the minute quantity available, and the writer would not vouch for its accuracy. In order to discover the condensing point with regard only to the petrol,

MODERN EUROPEAN ARCHITECTURE.

GERMANY.

[From *Berliner Architekturwelt.*

ROYAL PALACE AT POSEN.—Herr Franz Schwechten, Architect.

the gas was dried by passing over calcium chloride before passing into the freezing mixture.

As the piping in any installation is usually either sunk in the ground or inside the house, a very low temperature will hardly ever be met with in practice, so that trouble from condensation of a 6 per cent. gas need not be expected. One is always more likely to find water in the pipes than petrol, but this depends to a great extent upon the design of the machine, particularly in respect to methods of carburation. The deposition of water in the pipes is not of any great importance, as it can always be removed from syphon boxes in any properly designed installation, but the deposition of petrol means a loss of heating value from the gas, and may even become a source of danger if it can leak through the joints. The author would like to state here that in an experience of five years of work in connection with petrol gas he has never come across petrol in pipes except in a case where heavy motor-car petrol was used and carburation was effected at a temperature very much above normal.

The foregoing arguments show that there is no objection to a rich non-explosive mixture provided it is not too rich. Most makers of petrol-gas apparatus, however, seem to prefer a mixture in which all the air for combustion is sent through the pipes and none taken in at the burner. This is, of course, a violently explosive mixture in the gas-holder, which may be fired if a flame can by any accident flash back along the pipes. Hence these manufacturers have to take the most stringent precautions against this possibility, and to this end their burners are choked up with fine gauze or similar dust-collecting material, and there are, or should be, sets of gauzes at the exit from the machine into the service.

It may be argued that in a machine making a non-explosive gas the possibility of failure of the petrol supply may cause it to become explosive. This is a perfectly fair contention, and it would therefore be well to examine the possibility of trouble should this occur.

It is an essential of efficiency that the gas at the point of ignition should be a self-burning one, *i.e.*, an explosive mixture; and when using a rich non-explosive gas this effect is obtained locally by means of a Bunsen burner—the gas issuing from a small nipple and drawing in a further supply of air on its way to the burner head. Obviously, then, if a rich gas in the service produces an explosive mixture at the point of combustion (*i.e.*, about 2 per cent. of vapour to air) an explosive gas in the service will produce a very weak one at the burner head—in fact, a mixture too weak to burn at all, and so put all possibility of lighting back out of court. The writer found that with a machine making a 6 per cent. gas (the same being diluted to the self-burning mixture at the burner head) upon shutting off the petrol supply and still allowing the machine to run, the lights soon became dim and in a short time the flame lifted right away from the mantle and went out. By the time that the failure of the petrol supply had reduced the gas in the service to the explosive point all danger of firing this was removed by the burners automatically going out. Even if by any mischance—and the writer cannot conceive one occurring in practice—the flame could be lighted at the nipple, the latter consisting of a comparatively heavy piece of metal of high thermal capacity, with a small hole in it from which the gas issues, acts in exactly the same way as a piece of gauze and extinguishes the flame by lowering its temperature.

It will be noticed that most, if not all, of the systems employing the low percentage gas are those in which some hand regulation of the mixture is provided for, *i.e.*, machines in which the gas is apt to vary. The fact of the provision of any mixture regulator is, in the author's opinion, an admission of the fact that the machine cannot be relied upon to keep delivering a gas always of the same "make." Now if the proportions of the mixture have to be regulated some index of the desired mixture has to be provided, and as the condition of a self-burning mixture is very strongly marked by the colour of the flame when burned without a mantle, a pilot jet can be fixed on the machine to give the necessary information. If a richer gas were made for the service this index would be of little or no use, as a gas rich in hydrocarbon burns with a yellow flame of very little variation of intensity over a fairly large range. Hence it is very convenient to burn a 2 per cent. mixture in a machine which cannot be relied upon to keep the same gas automatically.

A point which is little understood by the layman is the

MODERN EUROPEAN ARCHITECTURE.

ROYAL PALACE AT POSEN.—Herr **Franz Schwechten**, Architect.

ative values from the pecuniary point of view of a gas ich contains only 2 per cent. of vapour in its composition d a richer one containing, say, 6 per cent. He is apt to agine that he is getting more value for his money when machine delivers 1,000 odd feet of gas to the gallon of rol (since "air costs nothing") than if it only delivered) cubic feet. When petrol-gas first came into prominence reat deal was made in advertisements of the low cost per 00 cubic feet compared with coal-gas, so that an examina- n of the claim might not be out of place here.

From particulars kindly furnished by the Anglo- erican Oil Co. the author gathers that each cubic foot vapour from their "Anglo-Special 0.680" requires for plete combustion 45·5 cubic feet of air, and a gallon es 28·4 cubic feet of vapour. From this it will be seen t one can obtain 1,318 cubic feet of gas to the gallon of rit, and all for the comparatively small sum of 10*d*. l gas being sold in the country at an average price of ut 3*s*. 6*d*. per 1,000 feet, it is no wonder that gas managers an to wriggle when petrol gas first came on the scene. t the excessive cheapness was more apparent than real. Anglo-American Oil Co. give the calorific value of this rol at 19,500 to 20,000 B.T.U.'s per lb., or, taking the er figure, 132,000 B.T.U.'s per gallon. Hence the calorific ue of this gas, of which we get such a lot for 10*d*., is only t over the 100 B.T.U.'s per cubic foot, and gives a lighting ue when burnt of little over 5 candles per foot. Coal gas an average value of about 600 B.T.U.'s per cubic , and gives a lighting value of 20 candles per ic foot when burnt at low pressure with a mantle. Again, gas can be produced in the Mansfield apparatus at about per 1,000 cubic feet, an apparently high figure until is acquainted with the fact that it has a calorific value of 0 B.T.U.'s, and gives an efficiency of 40 to 50 candles cubic foot. From the foregoing it is obvious that the re simply of "so much a thousand" is utterly useless as index of the cost of any gas.

The only valuable advantage in making a very weak gas at an escape is immediately diluted down beyond the com- tible limit by the air it meets in the room. But there is no excuse for having any escapes, especially as—the specific gravity of the gas being over 1—little over half as much petrol gas as coal gas will escape through a given leak. No insurance company considers a coal-gas installation a menace from the insurance point of view, so that in the author's opinion there is very little value in this point, and certainly it is of no value as a set-off against a dangerous gas in the gasholder.

In the category of machines which rely upon hand regulation to keep the gas right the writer would include all machines using a "surface carburettor" in any shape or form, or machines in which the fuel is allowed to run into the carburettor by gravity through a hole the proportions of which are governed by a needle which more or less chokes the aperture.

As there are several machines of the surface carburettor type on the market, it might be as well, perhaps, to define the term. By a surface carburettor the author means one in which excess petrol is supplied by any float feed or similar device, and air is allowed to pass over it, picking up as much hydrocarbon as it can hold in the form of vapour. Sometimes this is passed straight on into the service and forms a very rich mixture, which is burned at Bunsen burners, or else it is diluted down to the self-burning mixture by some hand-regulated device (with which is usually arranged some attempt at an automatic control). Neither of these systems is, in the writer's opinion, satisfactory, as the amount of vapour which air will hold is governed by so many variable factors (time of contact, temperature, humidity, and, worst of all, selective evaporation, a factor which it is practically impossible to control.) In the case of the petrol feed through a hole choked by a needle the alterations of viscosity of the fuel have to be reckoned with, and where the needle is controlled by the height of a relief valve—when lights are reduced in number the gasholder raises the air exhaust valve and closes down the petrol supply by means of the needle—an adjustment is only reliable for a given speed of the engine.

There is another class of machine which uses a weak mixture because by so doing the latent heat of evaporation can be obtained from the air absorbing the vapour, and hence no heat has to be supplied from an outside source. If no heat is supplied other than that derived from the specific heat of the air and the liquid, a drop in temperature will result of about 28° C. and, unless the air is supplied at several degrees above zero, the temperature will drop below the saturation temperature of a self-burning mixture, and the air will not hold even the 2 per cent. of vapour necessary for such a mixture. A machine built upon these lines, therefore, must be doubtful in frosty weather, and anyhow the air has to pass through some drying agent in order to take out all moisture before it reaches the carburettor, or the latter will soon choke up with snow and ice.

One of the first essential considerations in the design of a petrol gas plant is that of the motive power to be used to drive the apparatus. In order that the drop in pressure due to the passage of the gas through the pipes may be, for practical purposes, negligible compared to the pressure at which the gas enters the mains (and that the pressure at each point should be sufficient in the case of a rich gas to enable it to inject the extra air necessary for complete combustion, or in the case of a mixture already of self-burning proportions to force it through the layers of gauze, &c., used to prevent flashing back) it is found in practice necessary to deliver the gas from the machine at between 1 in. and 2 in. of water column. Now a 40 c.p. unit may require a consumption in the case of a 6 per cent. gas of as much as 4 cubic feet an hour, or in the case of a self-burning mixture of 11 ft. an hour. The author is aware that these figures may be criticised by makers of petrol gas plant, so he would state at the outset that they are based upon experiments in a laboratory with machines of both types under ordinary running conditions. Now a pressure of 1 in. of water column is equivalent to 5·2 lb. per square foot, hence the energy required for a 40 c.p. unit consuming 4 ft. an hour at 1½ in. is $1·5 \times 5·2 \times 4 = 31·2$ ft. lb., and with a weak gas consuming 11 ft. an hour $1·5 \times 5·2 \times 11 = 85·8$ ft. lb., which reveals another advantage of the richer gas. Taking as a typical example a house in which there may be 50 lights all on at once, it will be seen that in one case an expenditure of 1560 ft. lb. is required and in the other 4290 ft. lb. for every hour's run. Hence petrol gas machines seldom require to be driven by anything more powerful than a hot-air motor or wound-up weights. In the author's opinion, the latter method is the more satisfactory of the two, for in a well-designed weight-driven apparatus the power expended is always proportional to the load from all lights on down to a small by-pass, and should all lights be turned out no power is wasted—the power coming into operation again immediately a light is turned on. In the case of an engine-driven plant it is necessary to run the engine continuously whatever the load, and should it be thought necessary to provide for an emergency during the night when in the ordinary way no light would be required, either the engine must be kept running with no load, or a gasholder must be introduced supplementary to the rest of the plant. With a consumption of 11 cubic feet per light per hour, it will be seen that the storage of any useful amount is out of the question.

The foregoing figures of the power required are purely theoretical, and as it is practically impossible to obtain an efficiency of more than 50 per cent. they should be at least doubled to obtain working figures. The writer unfortunately has no figures as to the efficiency of an engine-driven plant, but found that in one particular case the cost of running the engine of a 25-light plant the whole night on no load came to about 3*d*.

As one is continually being asked for comparisons with coal gas, the following information should be of value. It may be stated at once that such comparisons are never satisfactory to both parties concerned, as there is the inevitable difference of opinion as to what is the average efficiency which may fairly be assumed in each case. The difficulties of such comparisons will be obvious when it is pointed out that, according to how coal gas is burned, the duty obtainable from an incandescent mantle may vary from as low as 11 candles per foot to as high as 40 candles a foot or more, though the latter is only possible with special compressing apparatus. The writer was present at some photometric tests made by Messrs. Mansfield & Co., Ltd. (the well-known oil gas firm), with two different types of petrol gas apparatus. They were tested just as sent out by the makers, and as presumably they would be installed in a private house; that is to say, no special attempt was made to tune them up for the occasion, and the tests may consequently be considered as being made under quite average conditions. With rich petrol gas of 334 B.T.U.'s per cubic foot gross a duty of 11·6 candles per foot was obtained (or, to be exact, a 35 candle-power unit consumed 3 cubic feet an hour). Now with petrol of ·680 sp. gr. and calorific value of 19,500 B.T.U.'s per lb. we get a value of 132,600 B.T.U.'s for 10*d*. net (which is about the present price of spirit after rebate of the tax to the consumer), from which data it is easily calculated that we get 1,000 candle-power hours for 2·17*d*. Assuming an efficiency for coal gas of 20 candles per cubic foot (and the writer considers this a very fair average for low-pressure house lighting), with gas at 3*s*. per 1,000 cubic feet (again a fair figure) we get 1,000 candle-power hours for 1·8*d*. Hence, light for light, petrol gas in this particular case was equivalent to coal gas at $\frac{2·17}{1·8} \times 3s. = 3s.\ 7\frac{1}{2}d.$ per 1,000 cubic feet. It is interesting to note in support of the contention that these are fair comparisons that Professor Vivian Lewes, in the tenth edition of the Encyclopædia Britannica, vol. 31, p. 653, gives the price of 1,000 candle hours with coal gas at 3*s*. as 2¼*d*., and with petrol at 10*d*. per gallon as 2*d*.

Any attempt at competition with coal gas is very much handicapped in the case of petrol gas by the consideration of the initial cost of the plant. In view of the very large field outside the radius of any central coal gas or electric lighting scheme one would not expect makers of petrol gas plant to spend time and money on such competition. Their chief rivals are acetylene firms and makers of private electric lighting plants. It is interesting to note that from figures given in a pamphlet issued by one of the best-known acetylene firms the price per 1,000 candle-power hours from acetylene works out at 6·25*d*.; or, light for light, three times the cost of petrol gas. The author has no reliable figures for the cost of light generated by a self-contained electric set, but the initial cost of a sound apparatus is very heavy compared with that of a petrol gas plant, whilst there is the disadvantage of not being able to use it for the ordinary domestic purposes of cooking and heating except at a ruinous figure.

This paper refers exclusively to the principles of petro air-gas lighting, and no detailed examination has been made of the different methods of its generation. It should be realised, however, that the design and construction of machine are factors quite as important as is the fulfilment o the consideration here dealt with.

The difficulties in the path of the designer will be realise when it is pointed out that in an ideal plant a gas of unvarying calorific value and unvarying pressure has to be produce automatically to meet a demand varying from full load dow to a mere by-pass under conditions of temperature varyin within quite wide limits, and that this has to be effected wit a fuel which, in its physical relationship to air, is peculiarl sensitive to these same everchanging factors of velocity an temperature. Moreover, it must be remembered that th apparatus must be such that it can be left in the hands any unskilled person, such as a domestic servant or a ga dener, and must therefore be "fool-proof" and never nee attention other than that involved in ordinary routine work Worst of all, a gas can be obtained by anyone by blowin air across petroleum spirit on its way to a burner with th consequence that all manner of unscientific persons a tempted into the field, the only result of whose labou is the loss of money and the "queering of the pitch" f firms running machines of sound construction and desig which are necessarily the result of prolonged study a investigation. Is it any wonder then that the history petrol air-gas is strewn with the corpses of unsuccessf undertakings?

It is to be hoped that purchasers will gradually realise t folly of believing all that they are told about petrol air-g machines, and that they may be induced to obtain the servic of an engineer to help them in the important choice of reliable system, for this is the surest way of escaping the di appointment of finding themselves saddled with an install tion which will cause them perpetual worry. There is more satisfactory illuminant than that supplied by a go petrol-gas plant, but there is no greater source of irritati than the constant blackening or dimming of mantles and t necessity for frequent readjustments of the machine, as the case of some systems at present on the market.

COMPETITION NEWS.

LITTLE CLACTON.—A new Council School is proposed to erected at Little Clacton, Essex. Competitive designs ha been submitted to the committee, who have decided to acce those sent in by Messrs. Tomkins, Homer & Ley, of 2 Bishopsgate, E.C., and Frinton-on-Sea, and appointed th architects for the new buildings.

Guild of Architects' Assistants : Visit to St. Andrew's Hospital, Dollis Hill Lane, Cricklewood (Mr. R. L. Curtis, architect).

CEILINGS AND THEIR DECORATION.

TO decorate the ceiling has been the almost universal desire, or shall we say instinct, of nearly every epoch in building. Even when the art of architecture was at its lowest level in the early nineteenth century, the flat plaster ceiling was considered incomplete without a "rose" or centre piece, the survival of the typical schemes of ceiling decoration in delicate plaster work of the eighteenth century "Adam style." The hideous monstrosity of design to which these centre pieces descended led naturally to their omission, and the ceiling became a desert waste of flat plaster, decorated only by the inevitable cracks produced by the deflection and shrinkage of the floor joists above.

Hence we arrived at the state of things against which Charles Reade led a vigorous crusade, and in his "Builders' Blunders" speaks of "standing on the first floor of the thing they call a house, with a blunder under my feet—unvarnished, unjointed boards, and a blunder over my head—the oppressive, glaring, plaster ceiling, full of its inevitable cracks, and foul with the smoke of only three months' gas." This "plaster ceiling," he adds, "may pass with London builders for a venerable antiquity that nothing can disturb, but to scholars it is an unhappy novelty, and, in its present form, inexcusable. It was invented in a tawdry age as a vehicle for florid ornamentation; but what excuse can there be for a *plain* plaster ceiling? Count the objections to it in a kitchen: (1) A kitchen is a low room, and the ceiling makes it nine inches lower; (2) white is a glaring colour, and a white ceiling makes a low room look lower; (3) this kitchen ceiling is dirty after a month's wear, and filthy in three months, with the smoke of gas, and it is a thing the servants cannot clean; (4) you cannot hang things on it. Now change all this : lay out the prime cost of the ceiling, and a small part of its yearly cost, in finishing your joists and boards to receive varnish, and in varnishing them with three coats of copal. Your low room is now nine inches higher, and looks three feet. You can put in hooks and staples galore, and make the roof of this business room useful; it is in colour a pale amber at starting, which is better for the human eye than the white glare, and, instead of getting uglier every day, as the plaster ceiling does, it improves every month, every year, every decade, every century. Clean deal, under varnish, acquires in a few years a beauty oak can never attain to."

With everything in this diatribe we can hardly agree. The plaster ceiling has one great practical advantage—it prevents every footstep in an upper room being heard in that below. Nor do we think a varnished surface, with its troublesome and poignant reflections, the best treatment for a ceiling.

Still, the main point is sound, that decoration is desirable for a ceiling. Of how this has been carried out in the past, we have a succinct account in a recently published work in the House Decoration series by Mr. Guy Cadogan Rothery,* who traces the historical development of ceiling treatment from the days of primeval man to the present time.

The methods of ceiling decoration employed by the Egyptians, the Assyrians, the Greeks, and the Romans are described in detail, as regards form, material, colour, and ornament. From these have come, with a growth of elaboration and variation of detail, but virtually no introduction of fresh motifs, the whole of the richly treated ceilings of the Renaissance. Of entirely different conception are the ceilings of Mohammedan architecture, Arabesque, Mauresque, or Saracenic, as to which we cannot follow the author in his adoption of the view that these were produced from Byzantine art. Of Mauresque or Saracenic art he tells us that "It is said to have been derived from the Byzantine, being a surface style built up of fragments, prisms replacing the small cubes of the artists in mosaic." It needs a vivid imagination to derive the stalactitic vaults of the Alhambra from the simple dignity of the domes of Santa Sophia. Prisms have taken the place of cubes. But these latter did not appear as cubes; they may not have been cubes. They merely show the face of a cube, and are as much flat, or rather plane, surfaces as if the decoration they form were executed in paint.

There is a tendency in our author to adopt the late German idea of a vegetable origin for Gothic architecture. He finds "in early Gothic an underlying feeling that the forest provides the best building material." Literally this was true, but for the early mediæval builder the best building material he could find was below the surface, as in the Forest of Dean. The characteristic of woodwork "in early Gothic" is that it is masonry in timber. To the lay mind there may be a fascinating analogy between the soaring pillars and vaulting shafts leading to the ribbed vault and the interlacing boughs of a fine avenue of well-upstanding timber trees. But the analogy is merely superficial.

When, however, Mr. Rothery directs his readers' attention to the universality of colour decoration in mediæval architecture, he is on surer ground, and he does well to emphasise the brilliancy of colouring and the boldness of contrast that characterise mediæval decoration. We must remember that heraldry was in the middle ages a living art and science, and that the primal object of heraldry was that one man's coat might be easily and unmistakably distinguished from another man's coat. This is the reason for the fundamental law of metal on tincture and tincture on metal, and for the preferential use of primary colours. Hence the use of brilliant, we might almost, from our modern point of view, say crude, schemes of colouring and the avoidance of tertiary tints till quite late in the mediæval period.

Our author is very severe on the work of the Brothers

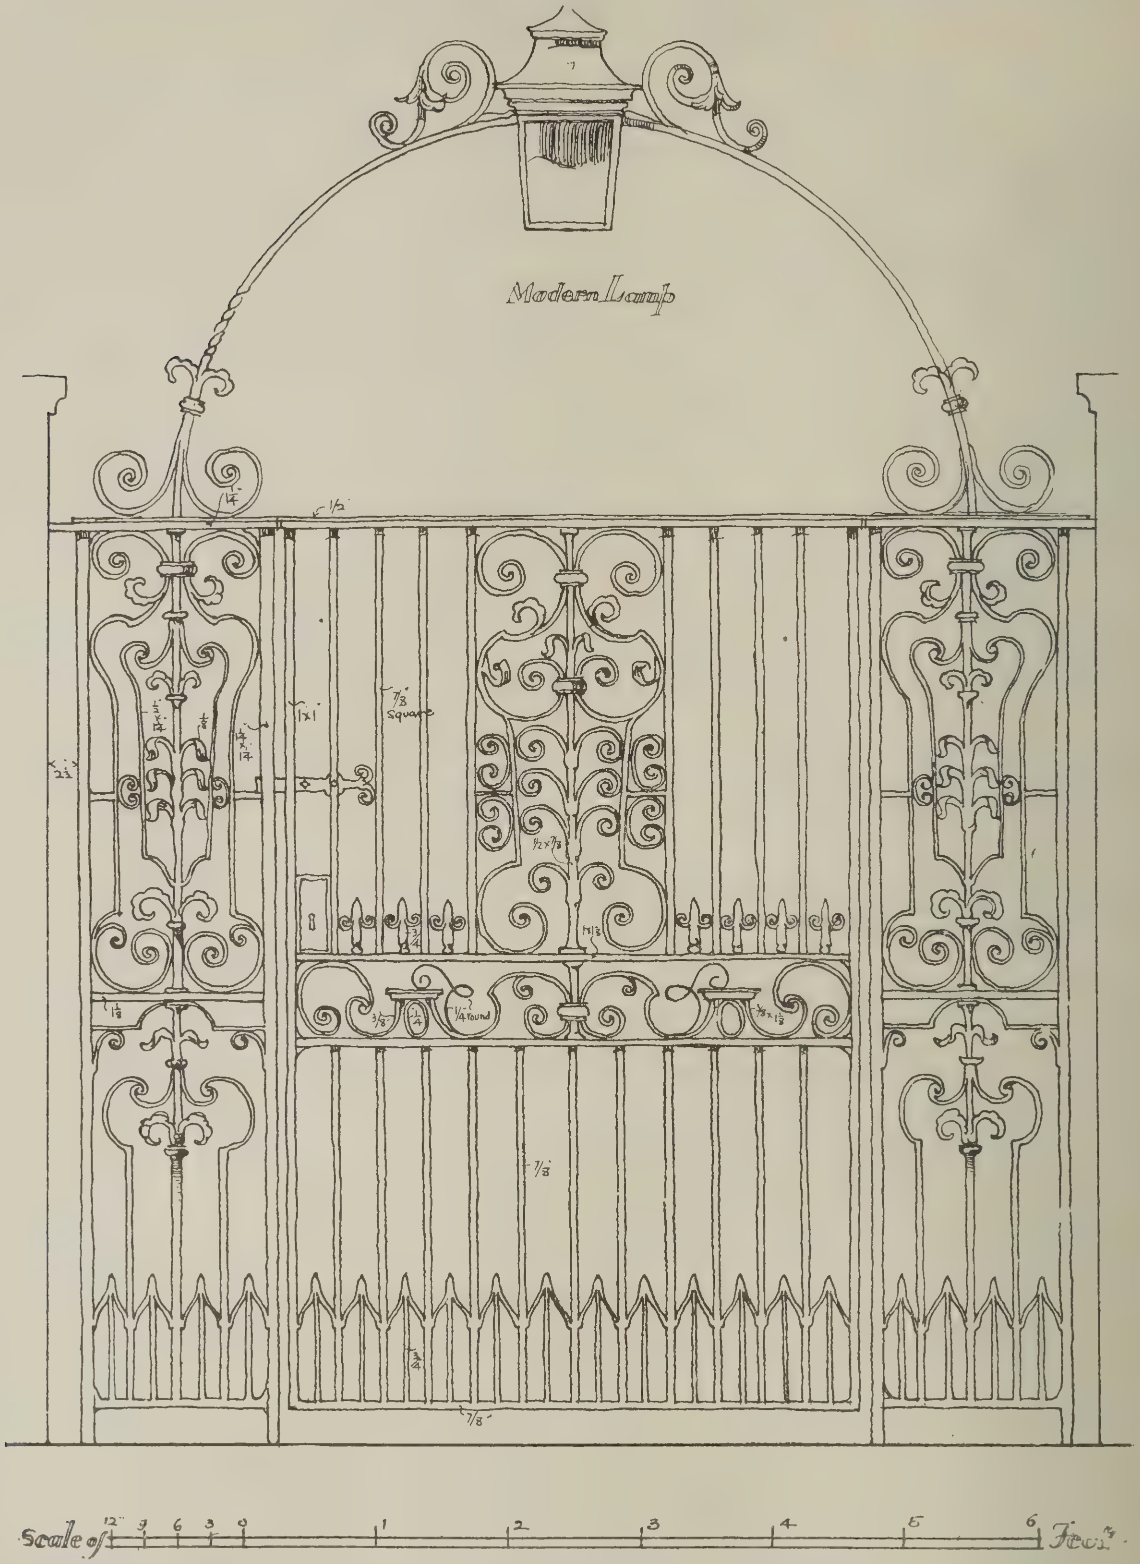
" THE ARCHITECT " STUDENTS' SKETCHING AND MEASURING CLUB.



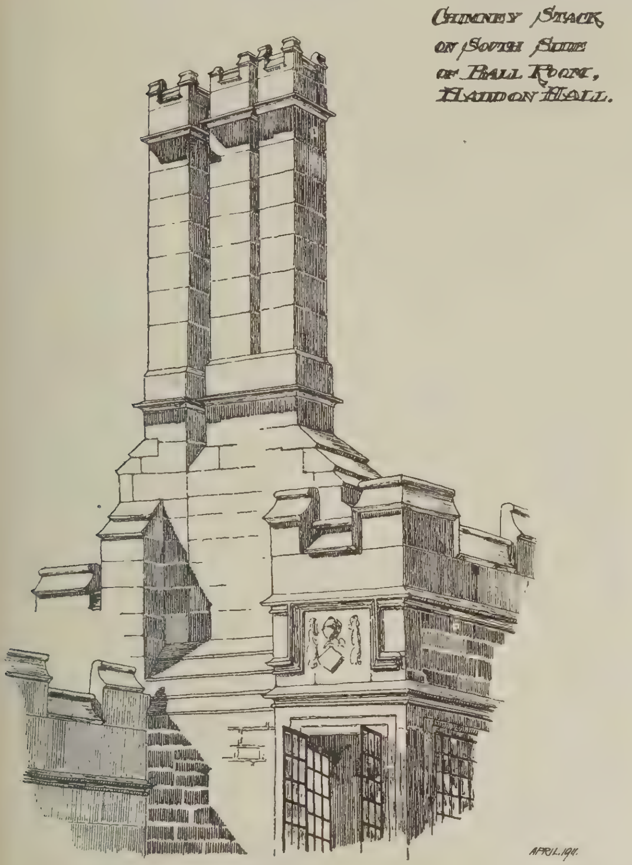
WROUGHT-IRON ENTRANCE GATE, THE TREASURER'S HOUSE, YORK.—Measured and drawn by "L'Quayt."

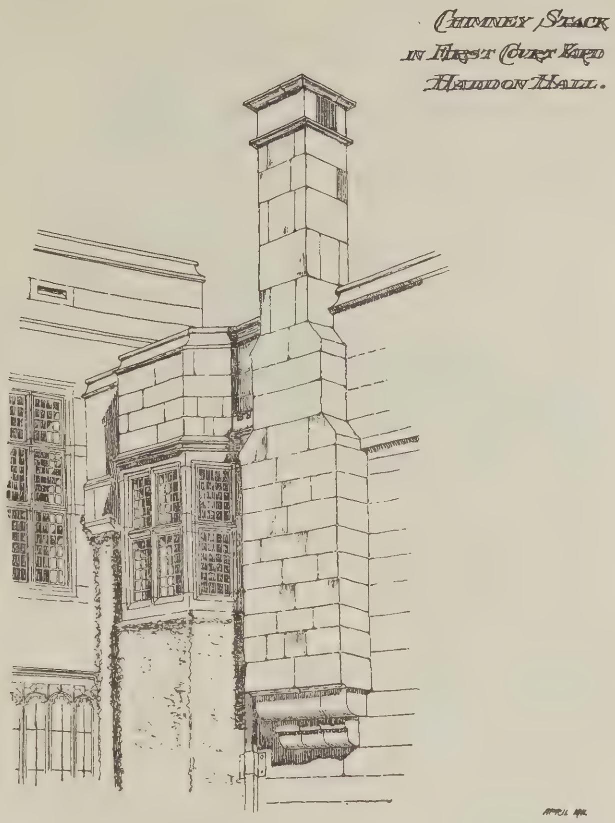
The accompanying illustration is of a fine eighteenth-century wrought-iron gate to the Treasurer's House, York. It leads from the road at the north-east of the Minster to the beautiful formal garden. The craftsmanship of the gate with its standards is very good and quite up to the standard of the more elaborate examples. The centre panel is beautifully designed and the whole composition and detail is a fine example of the logical treatment of wrought iron.

Adam, "who came within measurable distance of the brick box with cheap stereotyped classical ornamentation stuck on in the manner and style of pink and white cake decoration." It is the Italian colour of the Cinquecento and earlier period that meets with his approval. He, however, quite rightly, we think, points out the incongruity of the elaborate ceiling picture, for the full enjoyment of which "man must abrogate the dignity of his erect position, to lie flat on his back, or otherwise risk dislocation of his neck; in either case, scarcely conducing to a proper frame of mind for the appreciation of a work of art. Moreover, all such crowded compositions, with heavy architecture, restive chargers trampling over terra firma, impress the unreality too obtrusively on the mind. Admire them though we may as the fine productions of masters, they are examples to be eschewed as dangerous to all but giants, and adding little even to their credit."

Amongst the many excellent, though small, illustrations given in the book, mostly of Renaissance examples, we have in the Loggia of Psyche, of the Palazzo Farnese, a striking illustration of the infelicitous ceiling picture on the flat, with a lesson as to where figure subjects are

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.





Chimney Stack
in First Court Yard
Haddon Hall.
April 1911.

From Drawings by E H. Gibson.

Haddon Hall consists of two courtyards (upper and lower), around which are grouped various buildings. To the right is the chapel, to the left the banqueting hall. Haddon Hall dates back to Norman times. The hall porch, part of the north-east tower, &c., date from about 1300 to 1380. Between 1380 and 1470 some portions were added to the chapel and the remaining buildings on the east side of the upper courtyard were erected. Between 1470 and 1530 the western range of buildings in the lower courtyard and the west end of the north range were built. The buildings contain many fine examples of oak panelling and plaster decoration.

satisfactory in ceiling decoration, that is, in the deep coving which leads up to the flat.

Timber roofs and wooden ceilings and the use of plaster work form separate chapters in the book which help in the completeness with which the author has dealt with his subject, in a pleasant, chatty style, and imparted much information which will be interesting to the amateur and useful to the professional artist.

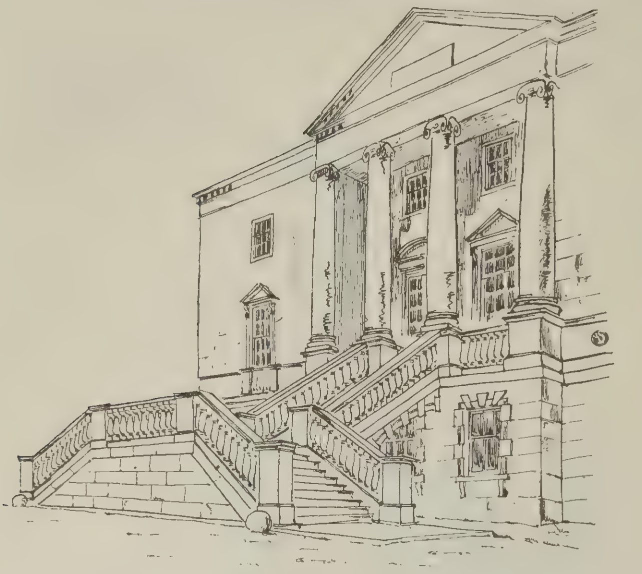
NOTES AND COMMENTS.

We fear there is a little bit of the "old master" dodge about the Tattershall Castle fireplaces. Who would give £3,000 for four fireplaces except on the "old master" basis? The castle and land, without the fireplaces, is going for £2,000; with them, £5,000 is the price. It is very good of Sir Henry Francis Trippel and the National Trust to step forward and save the fireplaces, but is not the price a bit inflated compared with the £8,000 for which the French Government bought Azay-le-Rideau? All the same, the episode of Tattershall shows the importance of the speedy completion of the work of the Royal Commission on Ancient Monuments and its necessary sequel, an Act of Parliament scheduling the historic monuments of our country and providing for their acquisition by the nation at a price to be fixed by valuation or otherwise for their preservation.

The latest fact about the Tattershall fireplaces seems to be that they are so much damaged by the ruthless way in which they have been torn from their setting and mishandled that their value as historic monuments is lamentably diminished, so they are not likely to fetch "old master" prices.

The old chapel of St. James, at Murton, near York, is one of the ancient monuments that had by wanton vandalism descended to fulfilling the purpose of a stable and cow-byre; but we are glad to learn from the *Yorkshire Post* that it has been rescued from that degradation, and that an effort is now being made, with the assistance of the Archbishop, the Dean of York, and Lord Halifax, to restore it to its ancient religious uses. The history of the chapel is full of interest, and it seems difficult to conceive that its interest was so imperfectly known, and its local importance so little appreciated, as to permit of its desecration within the last seventy-five years. It is not even a case, as was once wittily remarked by an eminent antiquary, of "destroying something in his memory," as has been frequently the case in York antiquities. The chapel is situated at Murton, a fairly populous portion of the united parish of Osbaldwick and Murton, lying some three miles to the north-east of York. The village takes its name from Osbald, one of the Northumbrian kings (793), who, after a reign of twenty-seven days, retired to Lindisfarne, at the solicitation of his friend, the famous Alcuin. Subsequently Alcuin's "sweetest friend," became an Abbot in Yorkshire, and was buried in the Minster at York. From an entry in Domesday Book, it is believed that he left his lands in Osbaldwick, three-fourths of the parish, to the priests of the Minster, on condition of supplying the spiritual needs of the parish. Chapels were built at both Osbaldwick and Murton in the twelfth century, and were chantries of Strensall, the prebendary of the latter being Lord of the Manor. In 1485 Dr. Poteman, prebendary of Strensall, formed the two chantries into a vicarage, and early in the sixteenth century his successor charged certain copyhold lands with a yearly payment of 11*s.* 8*d.* for the repair of the chapel at Murton.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



STEPS AT CONSTABLE BURTON, YORKSHIRE.
From a Drawing by Mr. E. H. Gibson.

Constable Burton, Yorkshire, is a building in the Palladian style, erected during the latter half of the 18th century, and was designed by John Carr, of York. He built most of the houses of any importance that were erected during this period. Amongst his works are Harewood House, Denton Park, Aston Hall, &c. The steps shown in the sketch are well proportioned, and the bridge-like treatment of the upper flight gives a good effect.

The growth of municipal administrative work is unceasing, and Leeds now finds that it has outgrown its present official accommodation. So, at a recent meeting of the City Council the following resolution, moved by the Lord Mayor, was adopted: "That in view of the urgent necessity of providing additional municipal accommodation, a committee be appointed to consider this question, and the adaptability of sites belonging to the Corporation for the purpose." The matter, he said, had been brought to his mind most forcibly within the last two or three months by two or three facts. In the first place, there had been a repetition of complaints as to the lack of suitable accommodation within the Town Hall for the administration of justice, not only with regard to Assize times, though especially then, but also in regard to other occasions. Further, at the annual inspection of the police force, the Inspector made a statement regarding complaints which had been brought to the attention of the Council of the lack of suitable accommodation at the Town Hall. The Inspector spoke more strongly upon the matter than ever before, pointing out the danger the Corporation ran in regard to its financial position unless better accommodation was provided. Another fact was the office accommodation of various Corporation departments. The Town Clerk's department was suffering severely, as were also other departments, and the matter had reached a stage when an inquiry would be a very wise step.

We do learn some wonderful things sometimes about building from the non-technical Press, especially in the provinces. For example, the general public is gravely informed that in Japan the building methods are just the opposite to ours and the roof is the first part of a house that is finished. As the Japanese house, of the older type, consists of nothing permanent except the roof and its supports, it is hardly wonderful if the roof is finished first. We suppose our contemporaries do not imagine that a Japanese roof is like Mahomet's coffin. And so how is it different from ours? Our roofs (and their supports) are the first parts of a house to be finished.

Another lovely wheeze. Mr. J. D. Rockefeller, the Standard Oil King (for fear we should not know the name), was minded to build a new wing to his house. His ingenuity is proved by the model he had constructed lately of the new wing. This model he made of wood, and placed upon a turn-table on the spot where he intended to build. Ingeniously arranged mechanism made it possible for Mr. Rockefeller, when seated in this box-like affair, to turn it about by means of levers. After much experimenting, he composed a time-table. This was the result of many days spent in the temporary structure. By the time the table was completed, Mr. Rockefeller learned when the sun would shine in each room. When he had completed his calculations, he turned the time-table over to the architects and told them to "go ahead." The time-table was based upon Mr. Rockefeller's daily scheme of life. For instance, he wanted light in the dining-room in the morning and at noon. The only time he insisted upon having light in his office was between two and three o'clock in the afternoon. He wanted his own bedroom dark between three and four o'clock in the afternoon, the hour in which he takes his daily nap after completion of his business in the office. If Mr. Rockefeller had applied to an English architect he might have had his house designed to give each room the light he wanted at any hour of the day without the expense of the model. But perhaps the Oil King wanted something to play with.

ADDITIONS TO THE VICTORIA AND ALBERT MUSEUM COLLECTIONS.

A NEW era may be said to have commenced with the old South Kensington Museum when, in June 1909, the new galleries for the art collections were opened by King Edward VII. As it now stands, the Victoria and Albert Museum is, in point of size, the largest existing institution of its kind in Europe or America. With the exception of the Louvre, no other museum approaches it in actual space covered. It is, therefore, a fitting decision of the Board of Education that after the year 1908-9 the annual report should be issued as a separate volume. As a matter of fact, a report was not published at all in the following year. Consequently the report just issued covers two eventful years in the history of the Museum.

Of particular interest to our readers will be the statement as to the progress made in the Department of Architecture and Sculpture.

Since the publication of the last report, in 1909, the Sculpture Section has been completely rearranged, and is now known as the Department of Architecture and Sculpture.

The Committee of Rearrangement had assigned the following rooms and halls to this department: The East and West Halls, the East Court, the Architectural Court, the three easternmost rooms facing the Brompton Road on the ground floor, and the three corresponding rooms on the lower ground floor, and the old Ceramic Gallery on the first floor the old building. This space was afterwards considerably curtailed. The old Ceramic Gallery was found to be unsuitable, the East Court was required for another purpose, and the passage between the two halves of the Cast Court was assigned provisionally to the Woodwork Department, as no other place was available for the carriages, sedan-chairs, and sleighs. This corridor is still occupied by these objects.

The collection of Italian sculpture, formerly in the North Court, has been placed in rooms Nos. 62 to 64 on the ground floor to the east of the main entrance; it has been chronologically arranged to illustrate as far as possible the development or the art from the thirteenth to the seventeenth century. In the first room on the east wall may be seen work ascribed to the Pisani and their contemporaries; the rest of the room contains examples of the Florentine school of the fifteenth century. In the middle room are the works of the Della Robbia family. The third room is devoted to later Florentine work and to sculpture from other parts of Italy.

The specimens of Italian, Spanish, Flemish, and French architecture, also mainly from the North Court, have been erected in the large East Hall, No. 50. The Florentine examples have been placed at the end of the hall on the east side of the bridge. To the west of the bridge in the next section of the hall are a series of doorways, those on the south wall being from Gubbio and Urbino, while those on the north wall are from Genoa. In the next section the south wall is occupied with North Italian architecture and sculpture, several of the examples being Venetian. On the north side of the section are arranged a great painted altar-piece from Valencia and specimens of Flemish and French architecture and sculpture.

The arrangement of the objects in the large West Hall, No. 48, was to some extent delayed by the fact that most of the space in that hall was required for the opening ceremony in July 1909, but considerable progress in the arrangement has since been made. The easternmost of the three sections into which it may be divided has been devoted in the main to English architecture, the westernmost to architecture and architectural fragments of a Saracenic character, leading up to the great Hispano-Moresque ceiling from Torrijos erected in the apse. One wall of the central section—in which it is now proposed to set up the doorways from Great George Street and Delahay Street (presented by H.M. Office of Works), the English stone and marble chimney-pieces, and other objects of architectural interest—is at present occupied by three large altar-pieces, German and Flemish work of the late fifteenth and early sixteenth centuries. It was not at first considered desirable to place these with other work of the same period in Room 10, owing to their size; but it is now proposed to find a position for them there in connection with the general rearrangement of the three basement rooms, 8, 9, and 10. In the original scheme for the rearrangement of the collection it was designed to keep these rooms, which are on the lower ground floor to the east of the main entrance, as a reserve for laying out and repairing any work in this department, and to open them only in special circumstances. Owing, however, to the reduced space now available for this department, as explained above, it has been found necessary to use these three rooms for the exhibition of the French, English, Spanish, Flemish, and German sculpture. The French sculpture is at present exhibited in the first room, the English and Spanish in the second room, and the German and Flemish in the last room.

The Architectural Court (Nos. 46*a*, 46*b*), mainly devoted to the collection of plaster casts, was closed to the public during the greater part of the year 1909, as the contents were considerably disarranged owing to the removal to the East Hall (No. 50) of certain large original exhibits (among which may be mentioned the portion of the old oak front of Sir Paul Pindar's house) and to the consequent repairs to the walls. The eastern half, containing for the most part casts of Italian sculpture, was reopened to the public in the spring of 1910, and is much used by students engaged in making measured drawings of architectural work.

The withdrawal of such objects of the Salting Bequest as were formerly in the Department of Architecture to separate rooms in the Museum left vacant the central section of the East Hall which they had previously occupied, and their place will be filled with Italian architectural details. But, in consequence of the strong light reflected from all sides in the East Hall, and particularly from the white floor, comparatively few of the objects of a purely sculptural character placed there can be seen to their best effect.

Several classes of objects of minor importance remain as yet unexhibited; among other specimens these include examples of Coptic stone work, some of which are of considerable importance. The present arrangements for the lighting and exhibition of the ivories in Room 109, the gallery at the south end of the South Court, will require further consideration.

Owing to the size of most of the exhibits in the Department of Architecture, students have in almost all cases to work at them *in situ*; for the present, therefore, it has not been found necessary to allot a special students' room to this Department.

The objects most studied are the English architectural exhibits in the West Hall and the casts of English and French Gothic architecture in the Square Court. The almost continual presence of some form of scaffolding in front of particular exhibits is a certain inconvenience to the general public; but it is pointed out that any attempt to limit the use of scaffolds to Students' Days might cause very serious difficulty to students actually employed in architects' offices or elsewhere, who are often unable to work in the Museum except on Saturday afternoon and on the open evenings.

New objects are in almost every case labelled as soon as they are placed on exhibition; and the old labels are constantly being revised in the light of recent research. The whole of the Italian sculpture was relabelled with revised typewritten labels during the rearrangement.

Progress has been made with the cleaning of a number of stone and marble exhibits that had become incrusted with dirt through long exposure to the London atmosphere.

The need of authoritative and fully illustrated catalogues of the various sections of the departments is fully recognised; this applies especially to the section of Italian sculpture, where further additions of great relative importance are not likely to be made. Material for this purpose is being collected.

The department altogether acquired 14 objects in 1909 and 51 in 1910, exclusive of the Salting Bequest.

Mr. J. H. Fitzhenry presented a handsome wooden staircase (exhibited at the entrance to the West Hall) from a house at Morlaix in Brittany; French work of about 1500 (A8-1909). This fine stair, which must have stood in the corner of a courtyard, is spiral in form, and has galleries and landings for three floors. According to the report, the principal feature is a tall column, elaborately carved with figures, shields, leaf-work and imbricated ornament, and surmounted by a statuette of St. John the Baptist; the balustrades springing from this column have linen-fold panelling. This interesting type of staircase is apparently peculiar to the town of Morlaix. Mr. Fitzhenry also presented a well-head of orange-coloured marble, dating from the first half of the 15th century, bearing on one of the sides the arms of the Concoreggio family of Verona (A9-1909)—this fine and unusually large well-head stood formerly in the courtyard of the Saladini-Moreschi Palace at Verona, now converted into a bank; and a 15th century Venetian sarcophagus of carved limestone, said to have come from the church of S. Giobbe at Venice, perhaps from the cloisters, which are now practically destroyed (A10-1909).

Three marble fireplaces (A1 to A3-1909) were presented by Mr. J. A. Dolmage in the name of his son, the late Mr. Cecil Dolmage; these are the work of Italian artists established in Dublin at the close of the 18th century.

Mr. A. Charbonnier presented an oak beam (A14-1909), English work of the first half of the 16th century; and Mr. A. Burman presented three 19th century Chinese carved wood figures (A11 to A13-1909).

There were no bequests in 1909. During that year, owing to the pressure of work involved in the general rearrangement, the only purchase made was that of four 14th century Moorish columns (A4 to A7-1909), said to have come from the Alhambra at Grenada. These columns had previously been exhibited on loan for some years. Two of the capitals bear the inscription: "There is no Conqueror but God." (£300.)

During the year 1910 there were many important acquisitions.

A series of doorways and other architectural details, mainly in wood (numbered A25 to A31-1910) were presented by H.M. Office of Works; these date from the 18th century—mainly from the last quarter—and were obtained from houses demolished in the early part of the year in Great George Street and Delahay Street. The gift was particularly acceptable, as doorways of this class are perhaps more continually measured and studied by architectural students than any other exhibits in the department.

Mr. J. H. Fitzhenry continued his generosity to the Museum by presenting an interesting relief of the Virgin and Child (A33-1910) in painted stucco, the work of a Florentine artist of the first half of the 15th century. Other work by cognate sculptors, sometimes gathered together under the name of the "Master of the Pellegrini Chapel," is already exhibited in the Museum; but this relief (of which there is a replica in the Kaiser-Friedrich Museum at Berlin) is an example of a particular group hitherto unrepresented. Mr. Fitzhenry further presented a collection of architectural details (A5 to A22-1910), mainly classical Roman work in stone and terra-cotta, but including Romanesque capitals, &c.—these were acquired at the Ferroni and other recent sales; and an extremely handsome figure of a recumbent knight in armour (A24-1910), typical of Venetian monumental sculpture of the late 14th century, which is said to have been obtained from a church in the Giudecca.

Mr. Max Rosenheim presented, through the National Art Collections Fund, an alabaster relief of the Assumption of the Virgin, English work of the "Nottingham School" dating from the 15th century. This panel, which has the colour unusually well preserved, forms a valuable addition to the collection of similar work already shown in the Museum; it was included in the exhibition of English alabaster work held in May and June by the Society of Antiquaries at Burlington House.

A further gift was that of three Japanese architectural models (A44 to A46-1910)—the Belfry of the Todaiji at Nara, the Taho-to (great pagoda) at Daidenbo-in, and the Hi-un-kaku (pavilion) at the Nishi Hongwanji, Kyoto, presented by Mr. H. Yamawaki on behalf of the Imperial Commissioners of the Japan-British Exhibition.

The magnificent bequest made by the late Mr. George Salting in 1910 has enriched this department in several directions; by far the most important of these, both absolutely and in relation to the collections previously possessed by the Museum, being that of Italian bronzes. The bronzes in the Salting Bequest (altogether about 120) do not, indeed, put the Victoria and Albert Museum on a level numerically with some of the great collections on the Continent; but many of the new acquisitions are of the finest possible quality, and almost all are of unimpeachable authenticity. A considerable proportion had been already exhibited on loan, and are thus familiar to visitors to the Museum. The bequest also included some Greek and Roman antiquities, ivories, and wood carvings.

Beyond question, says the report, the most important of the acquisitions by purchase during the year has been that of two life-sized recumbent effigies of white marble (A48, A49-1910) by a Spanish sculptor of the second half of the 15th century. These figures, which represent Don Rodrigo de Cardenas, a knight of the order of Santiago, who lived in the reign of King Henry IV. of Castile (1454-1472), and his wife, were formerly in the church of St. Pedro at Ocaña, a little town 10 miles to the east of Aranjuez; they are described as still *in situ*, with other tombs, in the third volume of "Castilla la Nueva," published in 1886. Don Rodrigo and his wife were the parents of Don Gutierre de Cardenas, whose arms adorn the great *artesonado* ceiling from Torrijos (407-1907), recently erected at the end of the West Hall. The knight is represented in full armour, wearing the mantle and badge of the order of Santiago and holding his sword; Donna Teresa appears to be in widow's dress and holds a rosary. At their feet are two beautiful female figures on a much smaller scale, resting on a helmet and on a pile of books; some parts of these, and of the larger effigies, have been carefully restored in marble. No doubt in their original position each effigy lay on a sarcophagus enriched after the usual Spanish fashion with heraldry and small carved figures. The date of execution must be placed, to judge from the costume and general style of the sculpture, in the last quarter of the century; the only definite piece of external evidence is that Don Alonso de Cardenas, who erected the monument to his uncle Don Rodrigo, died in 1499. The resemblance of the main figures, however, and still more of the little mourners at their feet, to those on the celebrated tombs of Don Alvaro de Luna and his wife in the chapel of Santiago in Toledo Cathedral, makes it plausible to suggest that the Cardenas effigies may also be the work of Pablo Ortiz, perhaps the greatest of Spanish sculptors of the later mediæval period, who was occupied on the Luna tombs in 1488 and the following years. (£1,000.)

Only second in interest to these magnificent sepulchral figures is the marble bust (A35-1910) of King Charles I., signed by Hubert le Sueur (1595-1650) and dated 1631, two years earlier than the same artist's famous equestrian statue of the King at Charing Cross. The bust is reported to have come from Holland, whither it might perhaps have been taken by Princess Mary of Orange: it appears to be the foundation of a type of which several versions exist, in bronze or marble, at Windsor, the National Portrait Gallery, the Albertinum at Dresden, and elsewhere. Le Sueur, who, although French by birth, lived in England from 1628 onwards, may be said to occupy an analogous position in the history of English art to that of his contemporary Vandyke; and this bust, with its evident fidelity to life in the features and delicately chiselled ornamentation on the armour, is a very notable addition to the collection of 17th century sculpture in the Museum. (£540.)

A third important purchase on a smaller scale has been that of an ivory relief of Christ in Majesty (A4-1910), Byzantine work of about the 12th century. In spite of serious mutilation this little panel, which is believed to have been found in Syria, still retains much of its original beauty and dignity. The ivory has been stained a curious green colour; and at some recent date the missing portions of the background have been carefully restored in tinted plaster. (£180.)

In addition to these, the department has made other interesting acquisitions by purchase.

Mr. George Armstrong, architect, Carlisle, has prepared plans on the instruction of the local Board of Guardians for proposed pavilions for consumptives and a Nurses' Home at Fursehill. The cost of the Home, with special accommodation for children, is estimated at £1,452.

THE LAKE VILLAGES IN THE NEIGHBOURHOOD OF GLASTONBURY.

Report to the British Association of the Committee, consisting of Dr. R. Munro (Chairman), Professor W. Boyd Dawkins (Secretary), Professor W. Ridgeway, Sir Arthur J. Evans, Dr. C. H. Read, Mr. H. Balfour, and Mr. A. Bulleid, appointed to investigate the Lake Villages in the neighbourhood of Glastonbury in connection with a Committee of the Somerset Archæological and Natural History Society. (Drawn up by Messrs. Arthur Bulleid and H. St. George Gray, the Directors of the Excavations.)

The second season's exploration of the Meare Lake Village by the Somerset Archæological and Natural History Society began on June 5 last, and was continued for three weeks under the joint supervision of Messrs. A. Bulleid and H. St. George Gray. The ground excavated was situated in the same part of the village and was directly continuous with last year's work.

The digging included the examination of the remaining portion of Dwelling-mound VII., the whole of Mound VIII., and portions of Mounds IX., X., and XI.

With reference to the construction of the above mounds, two, *i.e.* Mounds VIII. and IX., had special points of interest and call for mention here. Taken as a whole, however, this part of the work has been up to the present time somewhat disappointing, as little additional information has been gained regarding the structure generally, apart from that already acquired at the Glastonbury Lake Village.

Mound VIII. was of medium size, consisting of five floors and situated N.E. of Mound VII. No hearth was discovered associated with the two uppermost floors, which were separated with much difficulty throughout. An interesting series of eight superimposed baked clay hearths was, however, found belonging to Floors iii., iv., and v., surrounded by thick layers of fire-ash. The hearths varied from 2 feet 6 inches to 5 feet 3 inches in diameter.

Mound IX. was of large size, consisting apparently of two floors, and was only partially examined. Below the clay was a thick layer of black earth composed of charcoal, fire-ash, and débris containing quantities of bones of animals and fragments of pottery. Under the black earth a well-preserved platform of timber was disclosed, bordered by the remains of the wattled wall of a circular dwelling. This timber was chiefly arranged in a N.E. and S.W. direction, and by far the larger number of the wall-posts were made of squared oak, a feature not hitherto noticed in the dwellings previously examined.

The relics discovered this season were hardly as numerous as last year. A summary of them is appended.

Bone.—The bone objects were not very numerous. The most interesting specimen is a smooth pin without head, having a long recess, or notch, along the middle of the shaft. A similar object was found with Late-Celtic remains on Ham Hill, S. Somerset (Taunton Museum), and another on the Roman site at Iwerne, Dorset (Pitt-Rivers Museum, Farnham, Dorset). The other specimens include two tibiae of horse (sawn and perforated), two large polishing-bones, pins, a dress-fastener, part of a drill-bow, and two objects of worked bird-bone.

Worked Carpal and Tarsal Bones of Sheep or Goat.—A large number of "bobbins" and other objects, showing signs of considerable use, have been found, especially in Mound VII., where so many weaving appliances were discovered. Many of these bones are perforated in different directions; others have transverse markings, some deeply grooved and very smooth.

Worked Shoulder-Blades of Ox and Horse.—At the end of last season no less than thirty-two of these objects had been found, all in Mound VII. Four more were collected from the same dwelling this year; and two others in adjacent mounds. Two of those found in Mound VII. are ornamented with large examples of the dot-and-circle pattern. In all instances the bones are smooth, and the longitudinal spine had been cut down considerably. Many of them are perforated at the articular end (probably for suspension). They have been found where weaving implements are abundant, but their use remains to be explained.

Crucibles.—Fragments of two found this year.

Bronze.—Fifteen objects of this material were uncovered this year, but no fibulæ are included. There are three finger-rings, one ornamented by a cable pattern, two rivets (one of a new type), an awl, three thin moulded bosses, part of a belt-fastener, and a large part of the bordering of a perishable scabbard, including the bulbous chape. Perhaps the most interesting remains of bronze is a pair of pins with disc-shaped heads and arched stems.

Flint.—In addition to a number of flakes, a scraper and two or three finely-worked knives have been found.

Glass and other Beads.—The beads are numerous and varied. Nine were found last season; eighteen specimens this year. The collection includes two polished bone ring-beads. Six of the beads are of a yellow opaque glass, and two pale blue (also opaque). One of the finest specimens is a ring-bead of clear sea-green glass, and two are dark blue. A small blue bead is ornamented round the sides by a continuous wave pattern; two globular beads of clear white glass are ornamented in yellow, one by a spiral device, the other by a herring-bone pattern. The smallest bead is little more than $\frac{1}{8}$ inch in diameter.

Antler.—The numbered objects of this material have now reached the total of seventy-three, twenty-four being found this season, including three antlers of roe-deer, one bearing knife-cuts, another being shaped as a knife-handle. Nothing of exceptional interest has been found this season, many being pieces of cut antler impossible to name. The two hammers found have not been perforated for fitting handles. Several examples of the so-called "cheek-pieces," perhaps used in connection with the bridles and bits of horses, have been found, but the precise use of many of these objects is very doubtful, and their shaping and perforating varies very considerably.

Weaving-combs of Antler.—Again we have a fine series, bringing the former number of twenty-one up to a total of thirty-five. Mound VII., which must have been a weaving establishment, contributes no less than twenty-nine of the number. No dwelling in Glastonbury Lake Village produced more than nine of these combs. One example is dentated at both ends, with twelve and thirteen teeth respectively. The largest, having ten teeth, is $7\frac{3}{4}$ inches long. Several of them are ornamented with transverse and oblique lines, and one, at least, with dots-and-circles.

Iron.—The objects of iron are mostly fragmentary and much corroded as usual. The "finds" include a chisel, knife, file, and an awl in its handle of antler; also an earth-anvil. The latter was found on the top floor of a mound, and only a foot deep below the flood-soil, through which, owing to its weight, it may probably have sunk subsequently to the occupation of the village.

Kimmeridge Shale.—Objects of this material have this season been increased from twelve to twenty-one, and they are more numerous than in the neighbouring village of Glastonbury. These objects are parts of lathe-turned armlets, with three exceptions, viz. a set of three roughly-cut heavy rings, which may have been used in connection with horse-harness. In section one of the armlets (half) measures no less than 21 mm. by 16 mm.

Lead and Tin.—Last season three net-sinkers of lead were found, to which one has been added this year. The first object of tin has been found, viz. a small whorl (? bead) ornamented with encircling lines of small punch-marks.

Querns.—Compared with the Glastonbury Lake Village these are plentiful at Meare, but the circular rotary querns are rare as compared with the saddle-shaped specimens, of which some well-preserved examples have been found.

Other Stone Objects.—Parts of circular blocks of stone have been found, slightly recessed on one face and having a narrow rim; they show signs of intense heat and may be parts of moulds for casting thin bronze. A large assortment of stone hammers and whetstones have been found.

Sling-Bullets.—Several of the baked clay sling-bullets typical of the period have been collected. Under the clay floors of the mounds three groups of selected ovoid stones were discovered, the numbers being 99, 182, and 347, respectively.

Spindle-whorls.—The former number of twenty-three has this season been increased to forty-three. Most of them are formed from discs of lias; a few are of baked clay, two being very large.

Pottery.—Shards of pottery have been very numerous—some three or four hundred-weights. All of them have been scrubbed and preserved, being sorted under the numbers of the dwellings. Several complete pots may probably be built up some day. The proportion of ornamented fragments is high as compared with those from the neighbouring village, and a great many new and highly ornate designs have been added to the collection. Very little ornamented pottery was discovered in the deepest layers; and much of it bearing typical Late-Celtic designs was found just under the flood-soil. The coarser plain pots were generally found in the black earth and brushwood below the clay floors.

Human Remains.—Two pieces of skull and one bicuspid tooth.

Animal Remains.—Found abundantly. The perforated boars' tusks and canine teeth of large dog were no doubt used as personal ornament. The enormous number of bones of young animals indicates that the inhabitants of this marsh village must have been great meat-eaters. The remains of beaver and otter are frequently met with; and also a considerable number of bird-bones.

GAS AND THE SMOKE NUISANCE.*

THE chief offender against the clear sky is the domestic hearth, although the small factory and the chemical and other industries employing furnace heat are factors. The great iron trade may be left out of consideration, as requiring a critic more hopeful than myself.

It has been said that in the generation of steam double the coal is used that is needed, but in the private house six times. Many contrivances have been invented to enable ordinary bituminous coal to be consumed smokelessly, but the complication and consequent trouble and expense will always prevent such inventions coming into general use. The employment of some form of smokeless fuel appears to be the only remedy likely to be useful, and this fuel may be either solid or gaseous. The liquid fuels may be left out of account for domestic use.

The difficulty arises from the composition of coal and the nature of its combustion under ordinary circumstances. When coal is heated in mass and the temperature rises gradually there passes off a mixture of hydrogen and the heavier hydrocarbons carrying also quantities of finely divided carbon, possibly itself derived from some very loosely bound compound of carbon and hydrogen. As this mixture is given off at temperatures far below ignition point, it passes unburned to the flue, and appears as dense smoke. As the temperature increases the proportion of loose carbon falls, the hydrocarbons are of a somewhat lighter type, carbon monoxide also passes off, and the smoke fades through various shades of brown to grey, and finally disappears. It is not carbon alone which reaches the atmosphere and taints it, but carbon monoxide, ammonia, sulphuretted hydrogen, and various unburnt hydrocarbons. The loss of heat is enormous. When one pound of carbon is fully burnt to carbonic acid there is developed about 14,500 B. th. units of heat, but if carbon monoxide alone is formed the heat produced is only about 4,400 units. Thus 70 per cent. of the available heat of the carbon in this reaction is sacrificed, while a highly poisonous gas is delivered into the air. It cannot be too strongly emphasised that carbon-dioxide, or carbonic acid, is harmless if not present in such quantity as to prevent the due access of oxygen to the lungs. It may, without the slightest injury to health, be present in ten or twenty times the normal amount; but carbon-monoxide is a deadly poison, which the blood will greedily absorb even if present in only small quantity in the air inspired.

There are two classes of solid smokeless fuel available for ordinary use, anthracite coal and coke. The former has lost by natural means the greater part of its volatile constituents, and may be regarded as essentially carbon and ash. It is very difficult to ignite, and impossible to burn in the ordinary grate. There are many circumstances in which anthracite stoves are useful, but I think a living-room is not one of them. Direct radiation from a glowing bed of fuel plays but a small part in their heating effect, depending as it does so largely upon convection of the heated air and dark radiations from the metal of the stove. It seems certain that direct radiation from an incandescent mass is the most sanitary and comfort-giving method of heating. It is not meant that only the shorter-waved radiation is useful; rather should it be understood that a proper combination of radiation and convection is to be preferred, the heat varying in proportion from the two sources as circumstances are best suited. For comfort in an ordinary living-room the greater part of the heating effect is best got from radiation, and there is good reason to believe that from a sanitary point of view the same has to be said. The radiant heat from glowing fuel passes freely through the air of the room without materially raising its temperature. It falls upon the walls and furniture, warms their surfaces, and thence the air is warmed. When convection alone is depended upon, the walls of a room remain at a low temperature in comparison with that of the air, and there is a chilling exchange between the body and surrounding objects. It may be noticed that the temperature of a room heated by convection requires to be kept much higher than where radiation is the chief source; and certainly in this country nothing but a fireplace deriving most of its effect from radiation has any chance of general adoption.

---

* Abstract of a Paper presented to the Congress of the Royal Sanitary Institute at Belfast by Councillor H. Riddell (Belfast).

Ordinary gas-coke presents a like difficulty with anthracite, but in less degree. It is difficult to ignite, but when the draught is good and the bed of fuel fairly thick, it burns well in an ordinary grate if once ignited. There are some special cokes, produced by stopping the carbonisation before all the volatile matters have been driven off, and these will ignite almost as easily as coal, and burn as freely and as brightly. In Belfast, however, no more coke is produced than is sufficient to meet the demand from trade uses, and none is available for the private dwelling. It may be that certain developments in progress will allow of our Gas Department experimenting in the production of a coke cooled without water and in the absence of air, by which means a very freely burning fuel is obtained. At present, however, the especially useful and available smokeless fuel is the town gas. It is, of course, impossible for the private dwelling to manufacture a gaeous fuel, so that a supply if required must be drawn from the town mains.

There has of late years been a great advance in the use of gaseous fuels both for heating purposes and the generation of power. So great has been the effect upon the production of ordinary gas, that at present a very large proportion of any supply is absorbed for such purposes. Only in a very few places have separate mains been laid for the distribution of gas for heating and power as distinct from the lighting supply, and it seems probable that in the future, considering that illumination now depends almost solely upon flame temperature, a service of high-pressure mains may well supply both purposes.

A very great advance has been made in the construction of gas-stoves of all kinds, and they are steadily becoming extremely popular. In Belfast the Gas Department have sold or supplied on hire no fewer than about 20,000 stoves, and their number is steadily increasing. There are three classes of heating stove in use, those depending solely upon convection for their efficiency, those which combine radiation with special arrangements for convection, and those which depend mainly upon radiation from a glowing mass for their heating power. In the first class must be placed all the flueless stoves, which deliver the products of combustion, with or without condensation of the water vapour, into the air of the room. These are altogether unsuited to a living room, or to any place which is not very freely ventilated. They are used with advantage in halls and corridors, or in shops where ventilation is large, and they attain a high economy, as practically all the available heat of combustion is made of use. In the second class must be placed those stoves which have special gills or heating chambers provided, warming air and distributing it into the room as well as providing radiation from an incandescent mass. In many cases these stoves are most useful. Pure air can be drawn from outside the house and delivered in continuous supply into the room, so that a constantly pure breathing atmosphere can be obtained.

For bedrooms, where a mild temperature is called for in winter, such stoves are very valuable and economical. Even if the convection effect predominates to such an extent that the walls of the room are slightly colder than the air, it matters little. The coverings can be easily suited to prevent any heat exchanges from the body, and the temperature can be accurately maintained for hours at the same degree. For very large rooms such stoves seem also to be suited, but for ordinary living rooms those which depend upon direct radiation are greatly to be preferred. There has been much improvement in the past few years in the efficiency of stoves of the latter class, and experiments conducted with great care in the laboratories of Leeds University have made it certain that stoves are at present being produced which pass 50 per cent. of the heat of combustion by direct radiation into the air, while only a comparatively small proportion passes away among the escaping flue-gases. In an ordinary coal fire fully 75 per cent. of the heat of combustion is carried off in the flue-gases, while for cleanliness and convenience the gas-fire is unquestionably much superior.

There is no doubt that the gas consumption in many fires has been too large, but modern stoves are showing distinct advance in this respect, while care in setting will allow a greater effective result from the same consumption of gas. For example, there has been too great readiness to close up all openings into the chimney, except through the flue of the stove. This is in general a mistake, as there is caused thereby an intensity of draught much greater than is necessary to carry away the products of combustion, thus drawing an undue proportion of cold air across the radiating bed, and cooling it unnecessarily. The burner must be properly adjusted to both quality of gas and pressure. It therefore follows that it is a prime necessity in modern gas supply, where even the lighting effect depends upon flame-temperature, that the gas should be delivered to the consumer constant both in composition and pressure. It is impossible to properly adjust a burner which deals with gas requiring varying proportions of air for proper combustion. Means of adjusting the supply to requirements are too often omitted. It is not economical to adjust simply by turning down the gas. Much better to cut out one or two burners altogether, and leave the remainder acting under proper conditions.

As regards the use of gas for cooking, there is no doubt that this is always economical in ordinary circumstances, and as the use of a cooking-stove is only occasional, and it is generally placed in a well ventilated position, the provision of a flue is seldom necessary. Where, however, the stove is to be in constant and large use a flue is essential. Many stoves are provided with an economiser arrangement, utilising waste heat for warming water, but for heating on any large scale one of the special heaters of the Geyser class, with a proper flue provided, is both efficient and suitable.

One of the most convenient uses of gas in the household is in the domestic iron. Nothing is more wasteful in a coal fire than the metal heater for a box iron, while the small consumption of gas and speed and ease of preparation of a good gas iron are clear and great advantages. Nearly all the many thousands of irons in use in the large laundries in Belfast are heated by gas.

While the domestic fire is the chief in our list of sinners, the small factory still contributes a portion of the smoke nuisance, a portion gradually decreasing. Where the power employed is small, or where it is intermittent, as in the passenger lifts in our large buildings, electricity supplied from a central station very perfectly meets the difficulty. There are also many cases where considerations other than mere economy are in operation, which are well suited by a central electric supply, but in our large factories the economy of the production of power, and possibility of perfect combustion, are usually much better than in an ordinary electricity supply station. For moderate powers the suction gas producer, with a good gas engine, has come into considerable favour, yet the combination has some disadvantages of its own. At the present high price of anthracite there is a great reduction in its economy.

It is true that some plants are at work upon bituminous coal, or upon ordinary gas-coke, but the sum of experience on such has not yet been quite satisfactory. Until the producer can be completely depended upon with the fuels mentioned, there will not be the same prospect of rapid increase in use.

ILLUSTRATIONS.

MINARET, ABOUKIR.

THIS minaret was designed by Mr. Robert Williams, F.R.I.B.A., for Mr. G. B. Alderson. Only the lower stage and adjoining praying-hall and lavatories were, however, embodied in Mr. Alderson's presentation scheme to the village of Aboukir.

PREMIATED DESIGN FOR HARTLEY UNIVERSITY COLLEGE, SOUTHAMPTON.

IN this design by Messrs. Hickton & Farmer, although the completed scheme will form one continuous building, each department has been kept quite distinct, with separate entrances and stairways, and due regard has been given to the buildings being erected in sections at different times. The buildings are arranged as shown on the plans to form two quadrangles, one for the male students and one for the female students, for whom entrances are provided from the quadrangles to their respective cloak and common rooms. It was proposed to carry out the façades with thin dark red bricks in white mortar and Portland stone. The main entrance hall and stairs to be in marble. The roofs to be covered with grey-green slates in diminishing courses. The heating throughout to be by high pressure steam carried by mains in subways to the various blocks, where the heat would be converted by calorifiers to low-pressure hot water, each block and each room being heated independently and under the control of the occupants. The cost of the administrative and art block, which was to be first erected, was estimated at £35,068, and that of the complete scheme at £99,573. Messrs. Hickton & Farmer's design was awarded the third premium in the open competition for these buildings.

THE INFLUENCE OF CARBON AND OTHER ELEMENTS ON THE CORROSION OF STEEL.

Abstract of Report to the British Association of the Committee, consisting of Professor J. O. Arnold (Chairman), Dr. W. E. S. Turner (Secretary), Professor W. P. Wynne, Professor A. McWilliam, Mr. C. Chappell, and Mr. F. Hodson.

THE subject of the corrosion of iron and steel is one that is rapidly engaging considerable attention in the metallurgical world, the researches of Friend, Cushman, Walker, Longmuir, and others having brought it deservedly into considerable prominence. Despite the fact, however, that the modern metallurgy of iron and steel largely centres about the influence of various alloying elements upon its physical and mechanical properties, no reliable data are available as to the influence exerted by them upon its corrodibility. In view of the absence of such data regarding the influence of carbon, in gradually ascending percentages, upon the corrodibility of iron, and especially in view of the fundamental importance of carbon as an iron-alloying element, the Committee have confined their attentions solely, during the past year, to the investigation of the influence exerted by this element upon the corrodibility of iron.

An attempt was made by Andrews to obtain some data regarding this question, and his results were published in 1885 in a paper on "The Corrosion of Metals during long Exposure in Seawater"—one of a series of brilliant and systematic researches on corrosion which are unfortunately not so well known as they deserve to be. His ascending carbon series, however, included such widely diverse materials as wrought iron, Siemens and Bessemer steels, and also crucible cast steels, in which the percentages of Si and Mn vary considerably, rising as high as 0.4 per cent. and 1.3 per cent. respectively, while the S and P in some cases respectively reach such abnormal figures as 0.12 per cent. and 0.27 per cent. each. The values given by such a series can hardly be relied upon as being indicative of the influence of carbon alone upon the corrodibility of iron.

A series of pure iron-carbon alloys have, therefore, been obtained by the Committee in order not only to indicate the influence of carbon upon the corrodibility and other properties of iron, but to serve also as a base line from which the influence of other elements upon the corrodibility of steel may be determined in future researches. These pure iron-carbon alloys were prepared by the coke crucible process in the Metallurgical Department of Sheffield University, the materials employed being Swedish bar iron and charcoal, this method having been found to give the purest iron-carbon alloys obtainable. Six such alloys have been employed, ranging from 0.10 per cent. to 0.96 per cent. carbon, and the microscopic examination in the rolled condition showed the distribution of the micro-constituents in these steels to be remarkably even throughout the whole of the series. It is also important to note that, despite careful search, no traces were found of manganese sulphide, the powerfully electropositive nature of which tends to cause serious electrolytic action when present in steel, thus materially increasing the corrodibility.

The determinations of the corrodibility and other properties of these steels have been carried out in several states of heat treatment, which have been designed to resolve the pearlite into the principal varieties in which it usually exists in carbon steel—viz.: (*a*) Diffused (*b*) Laminated, and (*c*) Emulsified, and also into Hardenite, which is the essential constituent of hardened carbon steels. The treatments employed were (1) As Rolled, (2) Normalised, (3) Annealed, (4) and (5) Hardened and Tempered at (α) 400° C. and (β) 500° C., (6) Hardened.

The relative corrodibilities of these steels in all states of treatment have been measured by immersing polished cylindrical bars of the various specimens ($4\frac{1}{2}$ in. long × $\frac{3}{8}$ in. dia.), each separately in 700 c.c. seawater for a period of thirteen weeks, the loss in weight per cent. during this period being determined.

The results obtained indicate that the carbon exerts two types of influence upon the corrodibility, dependent upon the condition of the carbide in the steel. In the rolled, normalised, and annealed specimens, in which the carbide (as shown by microscopic examination) exists entirely either as the diffused, normal variety, or as the laminated variety of pearlite, the corrodibility rises to a maximum at saturation point (0.89 per cent. carbon), and then decreases upon the appearance of cementine in the steel. The rise in corrodibility in such steels with increase of carbon from 0.10 per cent. to 0.89 per cent. is not regular, but is much more rapid in the range 0.3 per cent. to 0.89 per cent. carbon than in the low carbon range 0.10 per cent. to 0.3 per cent. carbon.

In the hardened and tempered specimens, however, in which the carbide has been converted respectively either to hardenite or the emulsified variety of pearlite, it has been found that the corrodibility rises continuously from 0.10 per cent. to 0.96 per cent. carbon, no maximum being observed at the saturation point. The proportional increase of corrodibility in these steels with rise of carbon per cent. is very rapid up to about 0.25 per cent. carbon in the case of the hardened steels, and about 0.40 per cent. carbon in the tempered specimens. After these points the rate of increase of corrodibility with rise of carbon per cent. is small but regular up to 0.96 per cent. carbon, being in this respect the reverse of that found in the type first described.

The state of division of the carbide in the pearlite is found to exert very considerable influence on the rate of corrosion of iron-carbon alloys. In general, the annealed steels, in which the carbide exists entirely in the laminated condition, show a minimum corrodibility, while the tempered steels containing the carbide as the emulsified variety show a maximum corrodibility—except in the very low carbon steels. The normalised steels, moreover, in which the carbide is in an intermediate state of division, being mainly of the diffused variety, take up an intermediate position. This indicates that the finer the state of division of the carbide in the pearlite the greater is the liability to corrosion when immersed in seawater—a conclusion which is in complete accordance with the electrolytic theory advanced by Cushman and Walker. This is also supported by the fact that in the case of tempered steels a rise in the tempering temperature from 400° C. to 500° C. produces a marked decrease in the corrodibility, this no doubt being due to the slight decrease in the fineness of division of the pearlite which is produced by the rise in tempering temperature. The conversion of the pearlite into hardenite is accompanied by a very considerable rise in corrodibility, the hardened steels corroding more rapidly than any of the unhardened or tempered steels.

Careful examination of the deposits on the corroded bars on removing them from the seawater shows the rust deposit to be made up of two different types. These may be briefly described as

(*a*) Light brown deposit, flocculent and easily removed, forming an even coating over the whole of the exterior of the rust deposit.

(*b*) A deposit of a bluish black colour, somewhat greenish in some cases, underlying the previous mentioned deposit. This is mainly found at the lower end of the bars, to which it is usually somewhat firmly adherent. In the case of the hardened and tempered specimens a thin easily removed layer of a similar colour is found covering the whole of the bar underneath deposit (*a*), in addition to the firmly adherent deposit at the lower end. Whether this deposit is merely a form of deposit (*b*), or whether it is really a chemically different type of deposit of the same colour, is not known. A detailed examination of these respective deposits might probably throw considerable light on the phenomena involved in the corrosion of steel.

Determinations of the solution pressures of the steels after prolonged immersion in seawater have also been made with a view to ascertaining the influence of carbon on the electrochemical positions of the various steels under conditions of galvanic corrosion. The results up to the present, however, are not sufficiently conclusive to warrant any definite statements in this direction being made in this report. The influence of the condition of the carbide upon the relative electro-chemical positions of the steel is, however, more definitely shown. In the case of a saturated steel it is found that after three weeks' immersion in seawater the emulsified variety of pearlite is electropositive to the diffused and laminated varieties, while the conversion of the pearlite into hardenite renders it electronegative in this form to all the varieties of pearlite.

The solubilities of the various steels employed have been determined in 1 per cent. solutions of H_2SO_4 and HCl, in order to determine the influence of carbon on the solubility of iron-carbon alloys, and also to obtain an indication of the loss in weight per cent. sustained on immersion in acid solutions, as contrasted with corrosion in such solutions as seawater.

This was considered of importance in view of corrosion taking place under ordinary conditions, especially in large towns, where atmospheric acids contained in the rainwater play an important part. This section is also of interest in the case of corrosion taking place in such solutions as acid pit waters.

The solubility tests were carried out on polished cylindrical bars of the steels ($1\frac{1}{2}$ inch long by $\frac{3}{8}$ inch dia.), which were separately immersed for a period of forty-eight hours in

100 c.c. of the acid employed. The results obtained on immersion in 1 per cent. H_2SO_4 are remarkably similar to those obtained in 1 per cent. HCl, both as regards the actual values obtained with given specimens and in the type of influence exerted upon the solubility by the carbon per cent. and of treatment.

The influence of carbon on the solubility is found to vary considerably according to the treatment previously undergone by the steel.

In the normalised, rolled, and annealed specimens the solubility rises very rapidly from 0.10 per cent. up to 0.22 per cent., carbon approx., after which it falls abruptly, reaching a minimum at about 0.30 per cent. to 0.40 per cent. carbon. Further rise of carbon from 0.40 per cent. to 0.96 per cent. carbon produces a general, but somewhat irregular, rise in solubility in the normalised and rolled specimens, whilst in the annealed specimens a maximum solubility is reached at 0.60 per cent. carbon, after which the values gradually decrease again to 0.96 per cent. carbon.

The tempered steels show a rapid rise in solubility with rise of carbon from 0.10 per cent. to 0.30 per cent. This rise is followed by a range from 0.30 per cent. to 0.55 per cent. carbon, in which the solubility remains constant in the case of the specimens tempered at 500° C., and decreases in that of the specimens tempered at 400° C. After 0.55 per cent. carbon a very rapid and regular rise in solubility occurs with rise of carbon to 0.96 per cent., the values given in the latter half of this range being higher than those given by steels of any other composition or treatment.

In the case of the hardened steels, the carbon tends to exert a similar type of influence to that described in the steels tempered at 400° C., this fact being more evident in the 1 per cent. HCl results than in the 1 per cent. H_2SO_4 results. The variations with carbon percentage, however, are very much less pronounced, and the total rise in solubility from 0.10 per cent. to 0.96 per cent. carbon is very small. In connection with the influence exerted by the condition of the carbide it is found that the conversion of the pearlite to hardenite considerably decreases its solubility (in both acids) as compared with all the varieties of pearlite. Little decisive difference is observed between the steels containing the laminated and diffused varieties of pearlite, whilst the resolution of the normal pearlite into the emulsified variety results in a decreased solubility below 0.2 per cent. to 0.3 per cent. carbon and a greatly increased solubility in the upper part of the range above 0.7 per cent. carbon.

The solution pressures in 1 per cent. H_2SO_4 after twenty-four hours' immersion have also been determined, and these results again indicate the influence exerted by the carbon to be of two main types.

In the annealed, rolled, and normalised steels—taking E.M.F. in volts and carbon percentage as co-ordinates—two distinct maxima are observed at 0.22 per cent. carbon and saturation point respectively, whilst the values for E.M.F. reach a minimum at 0.45 per cent. carbon. The values given at the 0.22 per cent. carbon maximum are much higher than those at the saturation point.

In the case of the hardened and tempered steels, the values of E.M.F. fall directly from 0.10 per cent. carbon to a minimum at approximately 0.4 per cent. to 0.5 per cent. carbon, after which a rapid rise to a maximum at saturation point takes place, followed by a sharp fall to 0.96 per cent. carbon.

The relations between the values given by the various types of treatment are analogous to those noted in the case of the solubilities. The hardened steels are consistently electronegative to the other steels. The tempered steels are electronegative to the annealed, normalised, and rolled steels below 0.50 per cent. carbon, whilst the relative electrochemical positions are reversed in the range from 0.7 per cent. up to 0.95 per cent. carbon. Very little difference is produced in this direction by difference in the tempering temperature, as is shown by the close agreement of the results given by the two tempered series. The divergence between the annealed, normalised, and rolled steels becomes quite distinct above 0.3 per cent. carbon when the annealed steels become the most electropositive, whilst the normalised steels take up the most electronegative position in this group of steels when immersed in 1 per cent. H_2SO_4. Below 0.30 per cent. C. the relative electro-chemical positions become confused and inconclusive. There appears little doubt that the results obtained in this section of the research indicate substantially the relative electro-chemical positions which would be taken up by the various steels on immersion under galvanic conditions in 1 per cent. H_2SO_4 solution or in acid mineral waters of a similar type.

It will be observed that the resistance offered by carbon steels to disintegration when immersed in solutions varies considerably according as to whether the solution is of the seawater type or is acid in character, and also as to whether the conditions of immersion are simple or galvanic in nature. It is impossible, therefore, to specify any particular composition or treatment offering the best resistance to attack under all conditions, and each case must be considered according to the circumstances involved.

THE ARCHITECTURE OF LONDON HIGHWAYS.

By "Viator."

THE SILENT HIGHWAY OF THE THAMES.

We recall a quotation that was very rife a few years ago: "They little know of England, who only England know." It answered its purpose at the time; but of a surety with most of us the knowledge is even less; for not only do we not know England—we do not know London. In a general way we have some idea that it is a congeries of townships and that it embraces some one hundred and twenty square miles of area; but there the general knowledge of it in its broader aspects ends. Is not this wrong? Surely English people should see to it that they are in a position to speak intelligently, if not intimately, of their own Metropolis, before devoting their annual holiday to overrunning the Continent.

Suffice it that there can be no more potent magician for conveying to us a sense of the mere magnitude of London than the itinerary along Father Thames for the two-and-twenty miles, spanned by the Metropolis. Perhaps "spanned" is not quite the proper word to use, as this great extent of mileage is the result of an exaggeratedly serpentine course—but let it pass.

Twenty-two miles! Conceive what would be the sensation of pride in our bosom (a sensation, by-the-bye, quite unjustified), were we to conduct a foreigner along this watery route down from Hammersmith to Plumstead. "Ciel! est-ce que nous sommes encore à Londres?" would greet our tickled ears before we had reached even Vauxhall; and again—and yet again would the welcome interrogatory resound! Ah, well! is it not all vanity?

Instead, however, of descending, let us for this occasion ascend the river. And there is good reason for this from the artist's point of view; for, truth to tell, "below bridge" there is very little to engage the attention in regard to bricks and mortar. Yes! there is a plenitude of these materials, it may be granted; but rugged utility was the moving factor in the erection of the buildings that line the banks of old Thames from Plumstead to London Bridge; and to our mind it seems more fitting to work up the river to a climax than to work down-stream to an anti-climax.

But there are exceptions to the display of mere rugged utility, though amongst these we are not inclined to include Woolwich Arsenal, which dates from the reign of George IV. Over this and the dockyard we will not linger; but, as being the first London edifice worthy of notice, we will direct attention to Greenwich Hospital, that noble collection of buildings, where we are confronted by the designs of Inigo Jones, John Webb, Wren, Hawksmoor and others. There can be no wish to compare or to contrast or to discriminate, where it is all so fine and monumental and so filled with the best architectural qualities; the ⊓ treatment is probably the most effective architecturally. Where so many have contributed to the designs, criticism—laudatory or otherwise—may well be dispensed with; and our attention will be directed, therefore, to the statue of King George II. in the centre of the open space (we must not call it a quadrangle). That the monarch should be depicted in Roman garb is initially an error, but one for which Rysbrach, the sculptor, must not be held responsible; it was the current affectation. After saying this, we can frankly applaud the group, taking especial interest, however, in the carved north panel of the pedestal, displaying the Royal standard with its numerous quarterings showing the lions of England and Scotland, the harp of Ireland, the lilies of France, and the white horse of Hanover; the whole monument is sculptured out of a single block of marble. The interesting stone armillary spheres, eight feet in diameter, set atop the two gate-piers at the main entrance, cannot be seen from the river, nor can Inigo Jones's block, known as the Queen's House. Greenwich is, indeed, a building not to be seen merely from a passing boat; it needs detailed inspection. We must not linger over St. Alphege's Church at Greenwich, for this, too, is not properly seen along the river; nor, indeed, does the exterior of it demand prolonged inspection, saving the unusual and pleasing stone pedestals along the boundary, showing carved drums, such as we should like to see more frequently employed.

And after Greenwich, what is there to see? Wharves, endless wharves, "where the river Thames is pleasing and only the buildings vile," if we may thus far misquote Bishop Heber. In passing it may be noted that though nearly all the buildings are on a dead level of dulness, yet the owners of those along the right bank are much more prone than those along the left bank to record the dates of erection. The very few buildings that rise above the rest in the scale of architectural anæmia demand notice only by way of variety. But whilst still "below bridge" (we refer to London Bridge, of course) there are two other structures that demand our fixed attention; in fact, in the case of the Tower of London, it compels our attention; and it is the Hospital, the Tower and the Custom House that redeem the architectural vacuity of twelve miles of river.

But what a noble redemption! Either Greenwich or the Tower singly would accomplish this; together, and in company with the Custom House, all is well. The Tower of London has a charm that is possessed by no other building in the Metropolis, not even the church of St. Bartholomew-the-Great. In gazing upon this Norman pile, occupying an area of twelve acres, we become conscious of the impassable abyss between the Normans and us and our own times. Wren left his mark here, as he did in so many spots, for we are told that he altered the aspect of the Keep, part of the exterior being cased with flints, two of the towers being rebuilt and the openings altered into Italian windows. Tower Wharf is worthy of notice, being the work of Henry III.; it is nearly a quarter-mile in length and has a water-gate, known as the Traitors' Gate. Truly was it an instance of the luck of thirds, for the Royal builder failed twice before he succeeded; the wharf is built on land recovered from the river. The Tower is not beautiful in the ordinary acceptation of this term, but it possesses an undying charm and picturesqueness, enhanced (were enhancement needed or possible) by the neighbourhood of that apish neo-mediæval Art exhibited in the Tower Bridge. What possessed Sir Horace Jones so to degrade the Art, as to produce such an anachronism? Was it the result of collaborating with an engineer-son of Sir Charles Barry—the Barry whose Gothic failure at St. Stephen's we shall have to record anon? For Sir John Wolfe Barry's engineering there is nothing due but praise, and the easy-working bascules are a never-failing source of interest and admiration to gazers; but they should have been kept in countenance by the honest display of steel construction, undisguised though not of necessity indecorative.*

The Custom House is a quiet, reputable stone block with plain walling, showing a central colonnade and two flanking projections. The order of architecture employed is Ionic. The building is well proportioned, the raised central block (the work of Sir Robert Smirke) being supported by lower connecting blocks and wings. When all is said, however, the Custom House would not fix the attention, or even greatly attract it, were it not for the paucity of even noticeable buildings. As for Billingsgate Market, fewest words are best, except that in extenuation of Mr. J. B. Bunning's design it may be urged that official architects to public bodies are in a parlous position; officialdom in any profession—and more particularly in architecture and poetry—is apt to exercise an unhealthy influence; and so, in this case, we would prefer, Mr. Bunning being dead, to say nothing.

And London Bridge itself? Alas! for its vanished glories of picturesqueness and archæological value. When the City Corporation undertook a few years ago to widen the traffic-way, spending £100,000 in the process, they acted in the most modern spirit in effacing all picturesqueness.

Here and there we meet with an observant spectator who notices that the architectural interest of the Thames lies almost wholly on the left bank. In fact, it is comparatively but a small proportion of the whole extent of river frontage in the Metropolis—nearly forty miles, be it understood—that is architecturally bedecked. But we will linger for a brief spell opposite the building just "above bridge"—Fishmongers' Hall. It is a work of Wren's and a very pleasing one, showing a rusticated and arcaded ground storey, surmounted by a plain stone façade, decorated, however, with an Ionic Colossal Order of engaged columns. The superimposed shallow pediment, flanked on either side by balustrading, completes a very satisfactory river façade, whilst the entrance front in King William Street is also very good.

Of necessity, attention must be brief, during a river trip, respecting any object along the route; some, indeed, must be passed over without notice, bearing in mind the length of our serpentine course.

Hasten onwards, oh! boatman, and carry us west of Southwark and Blackfriars Bridges and the railway viaduct abortions; merely let it be noted, as we glide beneath Southwark Bridge, that it is destined for "improvement" shortly, and we wonder what changes the City Corporation will effect in its appearance—for the worse is an impossibility, we believe, and therefore we may live in hope.

And as we glide under Blackfriars Bridge, what do we find to be the most interesting features in connection with it? Not the bridge itself, though, indeed, this has been ignorantly described as "one of the handsomest (bridges) in London, its appearance marred, however, by the proximity of its neighbour, the Alexandra (L.C. and D.R.) bridge." Pity 'tis that Mr. Page (who designed the fine Westminster Bridge and who was selected in the first place for designing the one for Blackfriars) was thrown over for Mr. William Cubitt. After forty years it was destined to submit to the widening process, but nothing worthily monumental has resulted from the efforts of the City Corporation.

Glancing, however, below the bridge on the northern abutment at the period of low water, we perceive two elliptical openings, which are the outlet of the old river Fleet, now used merely as a sewer. And the second point of interest is that here commences the greatest continuous stretch of river frontage, displaying to our gaze objects of architectural interest. Many of the buildings that face the Embankment are not visible from the deck of a river boat; and where this invisibility is too pronounced such buildings will not be passed under review in this article; in other cases liberties may possibly be taken.

The Embankment itself, however, is an engineering work that undoubtedly demands notice. Sir Joseph Bazalgette, the engineer, has produced a piece of work which is a credit to the science of engineering, and which is by no means despicable as a work of art. True it is that the archways and the pedestals seem somewhat incongruous in the absence of statuary groups; but even here a healthy commencement has been made by the setting-up of that fine chariot group of Boudicca (known to us in our younger, though unregretted, days of youth as Boadicea, Queen of the Iceni) and her daughters on the pedestal next Westminster Bridge. The group is instinct with life and carries our thoughts back to very early days in the history of "this little isle of England, this dear, dear land." We are not concerned to dwell upon Cleopatra's Needle, an exotic that would be far better housed in the Victoria and Albert Museum; but a word of praise is due to the lamp standards along the parapet wall of the Embankment.

It is with deep regret that we feel compelled not to review York Gate, which at one time was washed by the Thames, but which is now concealed from a river-view, being sunk behind the Embankment in the Gardens.

And now to examine such of the buildings as may fitly be dealt with here. The City of London School is well worthy inspection, and Messrs. Davis & Emanuel, the architects, are to be congratulated upon the successful achievement of an architectural block. Here are congregated good massing and proportion, chiaroscuro, well-disposed ornament and dignity. The building is what Scriptural writers would describe as four-square; the angles are quietly emphasised on plan and suitably distinguished in elevation by pleasing lantern-finials. It is, in fine, a good Renaissance pile, with due regard paid to the superposition of Orders; and in its thirty years of existence its all-stone façades seem not to have deteriorated in the slightest.

Along the Embankment we find more modern Gothic buildings than it is customary to see nowadays along a thoroughfare, but of these only two will be noticed. Sion College, in foundation, dates back to the days of Charles I. It is of passing interest to notice these dates. In 1530 a priory for canons regular (which was situated against London Wall, near Cripplegate) was surrendered to King Henry VIII. A century later (A.D. 1631) this property was purchased for the use of the London clergy, who were incorporated by the name of the President and Fellows of Sion College. A century later again (A.D. 1731) appeared a little handbook on London, purporting to be written by a Portuguese merchant, Don Manoel Gonzales, and herein is an interesting description of the college as it existed at that time. But in process of years the site became unsuited for the purpose, and the present location adjoining the City of London School was obtained, Sir Arthur Blomfield being engaged to design the new building. We may suppose that this architect could not produce anything that was architecturally bad, but the college is not one possessed of outstanding merits; the best, and at the same time the most pronounced, feature is the massive porch; but it has the effect of dwarfing the rest of the building. And the pile seems to be all glass, which may look well enough from within doors in all its coloured glories; externally it is unsatisfactory. The other Gothic building to be noticed is one much further west, designed by John L. Pearson; the Astor Estate Office shows all-stone façades, in this respect differing from all the other and numerous Gothic buildings on the Embankment. Here is no one part dwarfing another; here we see orderly subordination, grouped masses, well-disposed windows and quiet ornament—a building quite free from the reproach of affectation. It is not tame, not insipid; it possesses the air of one who, though bred in the country, has received a University education; it is, so to say, Sir Roger de Coverley, not Colin Clout.

---

* The interesting account of the Tower Bridge at the date of its opening may be consulted with advantage; vide *The Architect*, July 6, 1894.

We will pass by the offices of the Port of London Authority, which are contiguous to Sion College, and will arrest our gaze at the offices of the Metropolitan Asylums Board. These are passable, but not admirable; there seems to be no distinct architectural *motif*, such as is apparent in the City of London School; and if we say that the most attractive feature is the top-story loggia, surely it is damning with faint praise. As a matter of fact, the building looks better *in petto* on paper than full size *in esse*.

If Sion College has a useful foil in the Port of London block, how much more pronounced is this the case respecting the Asylums Board buildings and the contiguous block, housing H.M. Exchequer and Audit Department? The latter, too, is passable—in the strictly derivative sense, and we will at once pass on. It might act, indeed, similarly as a foil for Telephone House, did the latter need a foil; but these head offices of the shortly-expiring National Telephone Company suffice to themselves, they and Hamilton House forming interesting pendants to each other. In many respects they possess features of similar nature, and altogether they balance each other admirably. Telephone House is, perhaps, the somewhat stronger work of art, but Hamilton House can point out, *en revanche*, some defects in its neighbour arising from this very merit of strength. Indeed, we consider that Hamilton House (the work of Sir William Emerson) harmonises in a manner which Telephone House misses. The boundary walls and railings are satisfactory in both cases; but here also Hamilton House rises superior by reason of the admirable treatment of the stone piers.

The London County Education Offices (erected for the London School Board, 1884-93) are too big and important to be overlooked entirely, but fortunately they are very much hidden from the river view, and for this we will thank the intervening Gardens. Messrs. Bodley & Garner have done good work—so, too, has Colonel Edis, C.B. (in any case, in this building the latter architect merely completed externally the design of the former architects, and is therefore not responsible). But not caring to linger over this frontage, we will pass on to the consideration of the *chef d'œuvre* of Sir William Chambers, a man whom we may not perhaps call a great architect, but who assuredly occupies a niche which many would wish hopelessly to rival.

Somerset House is certainly undeserving of the chastisement verbally inflicted by James Ferguson. Its positive architectural merit is conspicuous, its negative failures inconsiderable. Practically it met with the approval of the contemporary authorities immediately concerned, though it aroused a stormlet of contemporary journalistic invective; but some of this was possibly of a political colour. It should, of course, be judged from its own terrace, not from the Victoria Embankment or from the river; but it is patent, from the lower level of the Embankment, how correct were Chambers's ideas respecting basement and strand treatment (for it is necessary to remember that, a century and more ago, the river washed up against Somerset House). It is possible that a criticism of coldness of effect might be levelled against it; but, surely, the very character of the building would justify such an effect. The river façade exhibits the rather rare use of the Composite Order and—curiously, too—with unfluted shafts to the columns; we may suppose that even Chambers thought it permissible at times to set aside his texts, in practice. The colonnades *en l'air* (we can scarce designate them as "screens") are pleasing and may possibly have provided Mr. Norman Shaw with the *motif* in some of his work.

Hitherto the bridges that we have passed have not been of a nature to attract our admiring gaze, though our attention may have been perforce arrested. But now as we shoot Waterloo Bridge we are confronted by one that is worthy of all admiration. We have read of "critics" preferring Southwark Bridge as "being grander, if less ornate," but though this to us seems a most perverse view, yet we are quite prepared to admit that to such critics our own views would bear the same character. An obvious criticism that might be offered is as to the wasted effect of the Gargantuan granite columns; it may, indeed, be urged that such effect is more pronounced in this work of John Rennie's than in the case of Blackfriars Bridge; but who would cavil at a single blemish where the *tout-ensemble* is so noble?

We cannot linger over the edifices between Waterloo and Charing Cross Bridges; they are but mediocre, saving the admirable little building, erected by the London County Council from the designs of the superintending architect, Mr. W. E. Riley. This work shows a low Portland stone façade, surmounted by a green-slated steep roof, crowned with a lantern. The building is small but complete in appearance and is a delightful little bit of modern Renaissance.

Between Charing Cross and Westminster Bridges there are some buildings of merit and originality. The National Liberal Club, by Mr. Alfred Waterhouse, and Whitehall Court, by Messrs. Archer & Green, do not, it is true, show originality, but they are certainly meritorious. These two buildings form one architectural scheme to all appearance; not that their designs are similar, but because of their absolute harmony. Our personal tastes do not permit us to appreciate highly the general appearance of the clubhouse, and we can certainly not rate it at the same value as most of Mr. Waterhouse's work. The polygonal corner block is good, but not extraordinary.

As regards Whitehall Court, it is both good and pleasing, exhibiting a variegated symmetry, such as may be cordially approved. Except we are to believe that the original scheme of design included in its scope the club as well as the mansions, the odd disposition of the roof pavilions would be remarkable; as it is, the balance is quite satisfactory.

A thoroughly heart-satisfying building is New Scotland Yard, the headquarters of the Metropolitan Police, and one of Mr. Norman Shaw's many masterpieces. Criticism, as in the case of some other buildings noticed, would savour of impertinence; we prefer to thank the Genius of architecture that here there is, at any rate, a practitioner worthy of succeeding Wren.

We cannot doubt that, from the view-point of the general public, the building of buildings, situated on the banks of the Thames, from source to mouth, is the Palace of St. Stephen's at Westminster, otherwise known as the Houses of Parliament. This is the *opus magnum* of Sir Charles Barry, occupying the last twenty years of his life, which he laid down just before the completion of his great work. For whether one approves or disapproves the building from the standpoint of architectural merit, it is undoubtedly a great work. The pity is that an architect of Classic tendencies should have been called upon to erect a Gothic structure; is there not something eminently governmental—British governmental—in this fact, that a Classically-minded architect should have been selected for a Gothic building, and that a Gothic enthusiast like Sir Gilbert Scott should have been compelled to alter his Gothic design for Government offices in Whitehall into a Classic (or, at any rate, a Renaissance) design? But facts must be accepted, even if they cannot be condoned. As regards St. Stephen's, how often have we regarded it with the unprejudiced desire of agreeing its merits as a fine work of architecture? and each fresh inspection but served to strengthen the previous opinion. The building is neither good Classic nor good Gothic; as hinted above, it has the air of suggesting that the architect desired to erect a Classic building, but was forced by the powers to clothe it in Gothic vestments. St. Stephen's shows no sense of rest, and we may fitly quote Thomas Carlyle, who wrote of it in the year 1850: "What earnest soul passes that new St. Stephen's and its wilderness of stone pepperboxes with their tin flags atop, worth two millions I am told, without mentally exclaiming 'Apage' and cutting some pious cross in the air? If that be ideal beauty, except for sugarwork and the more elaborate kinds of gingerbread, what is real ugliness? To say merely (with an architectonic trumpet-blast that cost two millions), 'Good Christians, you observe well I am regardless of expense, and also of veracity, in every form?' Too truly these poor Fine Arts have fallen mad."

But there! let us, for a change, turn our gaze to the opposite bank, where are congregated some buildings that are worthy of notice. St. Stephen's Palace is confronted with St. Thomas's Hospital, and we do not hesitate to say that more credit by far attaches to Mr. H. Currey here than to Sir Charles Barry opposite. The warm red of the seven blocks of the Hospital with their communicating corridors and outlying buildings presents to the eye a very pleasing picture. Nor does the Hospital lose at all in interest by reason of its proximity to Lambeth Palace, archæologically important and architecturally valuable as the latter is. No one can pass the Lollards' Tower without being impressed by its massive dignity, nor the Palace library without glorying in it as an English possession. Lambeth Church is more interesting within than it is externally, but it groups well with the Palace.

Messrs. Doulton's factories form the first purely commercial block on the banks of the river calling for notice as an architectural composition. Here we see two buildings of brick and terra-cotta, with good substantial pavilion blocks at each angle, crowned by steeple roofs; the inharmonious feature in the group is the ungainly chimney-stack.

The National Gallery of British Art at Millbank is a building demanding appreciative recognition. A four-square pile, treated thoroughly symmetrically and properly insulated; here we see, for the first time since leaving Greenwich, such an entirely satisfactory work of art on an important scale as may worthily occupy a position facing the same river as Greenwich Hospital itself. For other satisfactory buildings that we have noticed cannot compare in artistic and civic importance combined with the Hospital and the Art Gallery. And in this case symmetry is not only justified but proper; the building and the Thames are mutually worthy of each other, and it is with a rare pleasure that we raise our hat to Mr. Sidney R. J. Smith, the architect, and mentally thank Sir Edwin Tate for his generous donation to the British public.

The church of Holy Trinity, in Bessborough Gardens, is one of the very few churches that confront the Thames. Mr. John L. Pearson was fortunate in having two of his architectural *chefs d'œuvre* so picturesquely situated. The Astor Estate Office has been already noticed; and here we see one of the many good churches that Mr. Pearson produced. The finely-proportioned tower and spire (the latter squinched and ribless) deserve close attention.

There will be other churches to mention later. Now, our eyes are turned to Chelsea Hospital, where Wren is again in evidence. Whether we regard the domesticity of the building, its proportions, or its harmoniousness, we are equally struck by its merits. What modern architect would be so venturesome as Sir Christopher in the design of such a very unadorned building? What modern architect, except, possibly, Mr. Norman Shaw? Here, as in Greenwich Hospital, we find the advanced wings, not that there is anything extraordinary in this treatment, but its effectiveness is indubitable.

Along Chelsea Embankment are congregated many specimens of domestic architecture—some worthy, others unworthy. With the latter we will not burthen this article; but who can fail to be pleased with the quaint and artistic "Queen Anne" façades erected some thirty years since, but so well harmonising with the original Chelsea as to form apparently an integral contemporary portion of it? And these façades carry us on to another interesting building, the old parish church, by no means a thing of beauty externally, though picturesque withal; but the appearance of it suggests an inspection of the interior, where a visitor is at once repaid for the tracing of his footsteps through the portal. Of a surety the curiously treated brick tower of the church, and the agglomeration of its parts do not suggest an architectural conception; but let it pass, absolved by the merits within doors.

From this church, as far west as the parish church of Putney, we draw blank, for the buildings seen *en route* do not call for detailed description, or even for passing notice. But now, as we reach Putney Bridge, we see on the right and left banks two old churches, respectively belonging to Putney and Fulham. In them there are many points of difference, but there is, all the same, the sensation of a bond of artistic sympathy in the treatment of the towers. To enlarge upon this is useless—the churches need to be seen for the sensation to be appreciated.

And then we skim over the waters for some distance in gloomy discontent, until, in fact, we pass under Hammersmith Bridge, when along this, the concluding stretch of river frontage we feel that whatever good work may have hitherto met our admiring gaze, there is at least no anticlimax here, for the many tit-bits of old domestic architecture are pleasantly varied with more modern but not less worthy work. Yes; we must admit that by the bridge itself there is a disfiguring stretch of frontage, but that once passed, and we drift along to the metropolitan limit at Chiswick in sweet content—in such content, indeed, that we are not concerned to describe to ourselves or to our readers any of the buildings in detail, preferring rather to regard this Hammersmith bank as a fitting crown to our lengthy journey.

VENTILATION IN CONFINED QUARTERS.

Introductory remarks by Leonard Hill, M.B., F.R.S., in a discussion at the British Association meeting, Portsmouth.

Carbonic acid up to three to four per cent. of an atmosphere has no noteworthy physiological effect excepting that it deepens the breathing. Smaller percentages of one to two per cent. are of no account. The breathing of six per cent. produces headache, palpitation of the heart, sweating, and the breathing becomes distressing. Higher percentages, eleven to twelve per cent., produce coma, but do not quickly destroy life. The partial pressure of CO_2 in the pulmonary alveoli and the concentration of acid (hydrogen ions) in the blood is kept constant by the automatic regulatory action of the acid in the blood on the respiratory centre of breathing.

An atmosphere containing one to two per cent. of CO_2 simply deepens the breathing to such a degree as to keep the acid concentration in the blood constant. Thus, apart from the extra breathing, carbonic acid has no effect on the body (Haldane). Diminution of the partial pressure of oxygen by one to two per cent., and even by three to four per cent., of an atmosphere, also has no effect, as we see by the fact that men live in health and vigour on high mountain plateaux where the partial pressure of oxygen is reduced by one-quarter or even one-third. The great affinity of hæmoglobin for oxygen enables man to wander through wide variations of barometric pressure, to quarry mines, and build railways, and execute some of his greatest works at a height of 15,000 feet in the Andes. Marten Flack and I have investigated the composition of the air in the sleeping-chamber of rats. If it is cold outside, the rats prefer to sleep in air containing as much as four to five per cent. CO_2 and only fourteen per cent. O_2. If the sleeping-chamber is hot and moist, the rats come outside. The discomfort and depressing effect of badly-ventilated dwelling rooms, workshops, schools, and meeting houses has, therefore, nothing to do with the chemical purity of the air, so far as concerns CO_2 and O_2, and Haldane has disproved by exact experiment the existence of any poisonous organic chemical matter in the exhaled breath. The ill-effects are mainly due to the effect of the close air on the temperature regulating mechanism and cutaneous nerves. The only reason for maintaining a high standard of chemical purity of the air of dwelling and working rooms is to prevent unpleasant smells arising from dirty clothes, sweat, and floors, and to keep down the mass influence of infecting bacteria.

Too much importance has been paid to the chemical purity of the air, and not enough to the temperature. It is most necessary to maintain the coolness and movement of the air, for this promotes the metabolism and activity of the body, and by stimulating the cutaneous nerves keeps up the tone of the body.

Our immunity to disease depends on the quality of the blood, and the supply of blood to, and of tissue lymph which transudes from the blood vessels into, each part of the body. The quality of the blood depends on the foodstuffs digested and absorbed into it, and on the mutual interaction of the organs which elaborate and purify the blood. The blood is circulated not only by the pumping action of the heart, but by each muscular movement and change of position, for the valves are set cunningly in the veins, so that each and every movement sends the blood swirling onward in its course. Above all, the breathing movements forward the flow of blood from the organs of the belly to the heart.

Now the activity of men engaged in sedentary indoor occupations depends very largely on the temperature and humidity of the air. If the air is over warm, windless and moist, we are slack, and losing less, we produce less heat. So we come to eating less and breathing less. The organs of the body then have a more restricted choice of building stones from which to elaborate the blood, and the blood moves in more sluggish streams through the outlying territories of our bodily world. Thus our first line of defence is weakened. If the air is cool and moving we are braced up and are active, eat more and breathe more. The blood is refined out of a large choice of foodstuffs, and the organs receive an ampler supply of the rarer and more precious of the chemical complexes—the building stones into which the digestive juices break down the foods. More oxygen is taken in, the daily turnover of the body factory is enlarged, and the blood which barters the rich merchandise of the organs one with another moves in ampler and quicker streams.

Our feelings of vigour and well-being depend, too, on the ceaseless in-flow of sensations from the sense organs. Taking a great part in the conscious term of these sensations are those from the skin. The cutaneous sense organs are influenced by the temperature, and by the relative humidity of the air, which controls the evaporation of moisture from the skin, and the passage of tissue lymph from the blood into the skin, and this influence has potent effect on our mental state. A warm, moist atmosphere brings much blood into the skin and depletes the viscera which perfect the blood, and robs the brain of an ample flow. The humidity and temperature of the air affect the mucous membrane of the nose and respiratory air-way, and the evaporation from and flow of tissue lymph through it, factors which must control largely both our comfort and varying immunity to catarrhal infections.

In battleships the great difficulty is to secure a good ventilation without excessive cooling of the individual. The space is confined, and the men next the ventilating orifices, feeling cold, shut them up. The conditions are such that a man with tubercle bacilli in his sputum is very liable to infect others whose natural immunity is deficient. The mass influence of the dose must tell heavily here. In small fishing boats the men shut up the cabin and sleep in air in which the lamp may finally go out from want of oxygen (less than 17 per cent.). Men with tubercle ought to be at once weeded out of battleships. The introduction of the electric fan in India has increased the power of the European to sleep and work beyond measure. I believe every employer and benefit society would find it pay both in increased output of work and lessened loss from ill-health, if every factory and workshop were brought below 60° F. and well swept with currents of air. We accustom ourselves to live in rooms that are too warm.

I visited recently the Leo Road London County Council school, where every room is swept with a gentle current of air at 57° to 60° F. by a plenum system. The courteous head-master told me the lost attendances from infectious diseases were fewer than 1,000 per year, while in other schools they reach 10,000 and more. The rooms felt cool and pleasant, and the children and masters appeared fresh at 4 p.m. The parents say the children eat more when they come to school.

Haldane has insisted on the necessity of paying attention to the wet-bulb temperature in factories and mines. This applies also to ships. The wet-bulb should not exceed 75° F., and must be kept below 70° F. For high wet-bulb temperatures a better current of air must be supplied. I have enclosed half-a-dozen students at a time in an airtight chamber containing about 3 c.m. of air. After about half-an-hour the CO$_2$ has risen to 3 or 4 per cent., and the temperature has reached about 85° F. wet-bulb. The men are then very greatly relieved by putting on electric fans on the roof, which whirl the stationary stale air in the chamber and cool their bodies.

I find that while raising the percentage of CO$_2$ suddenly from 1 to 2 per cent. has no appreciable effect in increasing the discomfort, putting the fans on or off makes a very great difference. The stationary air entangled between the bodies of the men becomes warmed to body temperature and saturated with moisture at body temperature. They cannot lose heat by radiation to each other. The skin becomes warm, flushed, and bathed in sweat. Putting on the fans whirls the air round and brings the cooler air (at 85° F.) in contact with the body, and so promotes loss of heat by evaporation of the sweat and convection. Benedict has kept men for twelve days in his calorimeter with a very deficient ventilation current. So long as the chamber was kept cool they kept in health and comfort, worked hard and had no sense of closeness.

Carrying out a series of work experiments in our chamber with Messrs. R. A. Rowlands and H. B. Walker, I find the pulse frequency is more accelerated during the work and takes longer to slow down again when the fans are off than when they are on. The pulse frequency depends on the wet-bulb temperature, and the CO$_2$ percentage makes relatively little difference to it. The breathing volume, on the other hand, depends chiefly on the CO$_2$ percentage.

Remarks by Professor N. Zuntz.

Dr. Leonard Hill in his introductory remarks refutes the idea of the harmful action of carbonic acid up to three or even four per cent. of the atmosphere, and he also attributes no importance to any substances exhaled by the organism together with the carbonic acid. I can agree with this view in so far as the great number of positive data on the poisonous action of the exhaled products of living animals is opposed by excellent experiments in which no sort of noxious effect could be demonstrated. This innocuity seems well proved for man by the experiments of Benedict in Atwater's respiration calorimeter. On the other side, noxious effects have been stated in guinea-pigs—that means in animals whose bowels are the seat of intense fermentations. The idea that the products of those fermentations may be poisonous in some cases is supported by the fact that there exist diseases in man which are considered as caused by poisonous substances absorbed from the intestines. Why may not one or another of those poisons be volatile, as SH$_2$ is? Moreover, one may object against the conclusiveness of Benedict's experiments, that he circulates the air of his chamber through great vessels containing concentrated SO$_4$H$_2$. This acid may destroy the volatile toxins of the air and so keep their quantity on a low innocuous level.

For some years I have considered in my lectures on the hygiene of domestic animals the prevention of excessive moisture of the air in stables as the most important aim of ventilation. But I have not only had in mind that special point, the importance of which Dr. Hill has explained so clearly—that is, the prevention of a sufficient cooling of the body when the evaporation from the skin is interfered with by the saturation of the air with vapour. As soon as the air is saturated there begins a condensation of water at the cooler parts of the walls. This condensation obstructs the capillary pores of the walls and diminishes the ventilation through them. So the removal of moisture is interfered with more and more, and a vegetation of bacteria and mould sets up in the walls and produces noxious gases and vapours. The same thing often happens in newly-built houses, when they are inhabited before the hydrate of lime has been changed into carbonate.

If we ask, now, how to provide for the ventilation of a room to prevent the condensation of vapour, we may make the following calculation. A man excretes in twenty-four hours *in minimo* 800 gr. CO$_2$ and 1,000 gr. H$_2$O vapour, that means at a pressure of 760 mm. = 400 litres CO$_2$ and 1,600 litres H$_2$O. If the ventilation would keep the content of CO$_2$ in the confined air as low as 0.25 per cent., the quantity of vapour added to the moisture of the entering fresh air would be 1 per cent., that is 7.6 mm. tension of the vapour. This added to that of normal outside air of medium temperature would bring its humidity near the point of saturation. So we understand that the limit of CO$_2$ content, which Pettenkofer empirically found to be consistent with the feeling of euphoria of the inhabitants of a room, is really that limit at which the danger of condensation of water at the walls begins.

Now we easily understand that a much larger quantity of CO$_2$, up to 2 per cent., produced no inconvenience in Atwater's respiration chamber, where the moisture was continually condensed by the heat absorbers, which keep the temperature of the chamber on a constant level. In the result we cannot agree totally with Dr. Hill's conclusion that movement of the inside air by fans, which cools down the temperature of the skin, may replace normal ventilation with fresh air. Such action of fans will certainly elevate the efficiency of the included working men to normal height for some hours. But if we wish to keep the room in a sanitary state, we must either increase the fresh-air ventilation to the standard prescribed by Pettenkofer, or we must condense and eliminate the overplus of moisture by cold surface, as it is done in the apparatus of Atwater.

A PREHISTORIC SITE AT BISHOP-STORTFORD.

Report to the British Association of the Committee, consisting of Professor W. Ridgeway (Chairman), Rev. Dr. A. Irving (Secretary), Dr. A. C. Haddon, and Dr. H. W. Marett Tims, appointed to co-operate with a Local Committee in the excavation thereof. (Drawn up by the Secretary.)

The early facts which suggested the prehistoric interest of this site were brought to light in the excavation of a boggy patch of ground in the high flank of the Stort Valley at nearly 300′ O.D., the idea being the formation of a "lily-pond" to improve the ground above Maple Avenue as a building-site. In this way, by the care of the experienced workman, F. Curtis, the complete horse skeleton (on which a Paper was read last year to Section H by myself, the cogent geological facts being treated in a Paper read before Section C) was uncovered, in the exact position indicated in the photographs. The "finds" on the actual site, taken altogether, suggest its occasional and repeated occupation by nomadic peoples (attracted by the high-level spring, to which

MODERN EUROPEAN ARCHITECTURE.

[From *La Construction Moderne*.

THE OCEANOGRAPHIC INSTITUTE, PARIS.—Mons. NENOT, Architect.

the physiographic details of the locality are due) after the fashion of a gipsy-camp.

In 1910 the following gentlemen formed themselves into a Local Committee for the further exploration of the site where the horse skeleton was unearthed: Rev. A. Irving, D.Sc., B.A. (Chairman and Secretary); J. Dockray, Esq., M.D., B.Sc.; W. Hartigan, Esq., M.D.; Rev. H. Hollingworth, M.A.; A. W. Nash, Esq., M.A.; F. S. Young, Esq., M.A.; Mr H. G. Featherby, C.E.; Mr. Joseph Day (the proprietor). In response to the appeal made at the time subscriptions to the amount of £7 2*s.* were received. Of this sum £6 2*s.* was expended for skilled labour and contingent expenses. Subsequent subscriptions have brought the amount (paid and promised) up to £11 18*s.* The total expenditure up to the end of July 1911 has been £7 2*s.*, leaving a balance of £4 16*s.* in the hands of the Secretary for further work.

In the autumn of 1909 the geological structure of the hill was more fully determined by two borings on Mr. Day's land and two on Sir John Barker's land above. The facts thus ascertained confirm generally those previously known from the two well-sections at the waterworks 350 yards distant. (See *Mem. Geol. Survey*, vol. iv. p. 449.) In May 1910 the pond was drained and the bottom of it thoroughly explored. The mud was first scraped off the bottom and passed by two workmen through a screen under the supervision of Mr. H. G. Featherby and myself. It was then dug all over to the full depth of a shovel without finding the slightest trace of anything that could be associated with a modern horse. A considerable addition was made, however, to previous prehistoric "finds," and a Holocene molluscan fauna was discovered in the bog silt. The silt was in places strewn with shelly débris, and it was only with the greatest care that complete specimens could be secured for identification. Of these the following have been identified by Mr. B. B. Woodward, F.G.S., of the British Museum (Nat. Hist.): Helix nemoralis, Hygromia (Helix) hispida, Vitraea nitidula, Succinea putris, Pyramidula rotundata, Helix arbustorum. Clausilia was, I think, also found, but unfortunately got crushed at the Museum before it was identified. A small bivalve was fairly frequently met with, which I have identified at the Jermyn Street Museum as Pisidium.

Of the fossil shells mentioned above it may be pointed out that six at least of them have been noted in the Holocene deposits at Staines, six have been described from the Barnwell Gravels, and three are described by Von Hauer as characteristic of the diluvial loess of the Rhine and the Danube.

Reasoning from the geological data, the writer of this Report was led at an early stage of the investigation to conclude that the formation of this bog must have taken place in early post-glacial times; that inference seems to be confirmed by the palæontological evidence.

In the Paper read last year before Section C palæolithic and neolithic flint implements and "cores," fragments of baking-tiles, fragments of pottery (neolithic and bronze periods), primitive bricks moulded with human hands, an ingot of crude bronze, fragments of charcoal, and a variety of erratic boulders are enumerated. These were recovered by turning over the materials which had been wheeled out of the pond-basin, together with several missing small bones of the skeleton. The tile-fragments and mammalian bone-fragments are numerous; a caudal vertebra of Bos, and a few molars of Bos and Equus were also found; and the vegetable contents of the beast's paunch, reduced to a state of peat (one cake of it strongly stained with phosphate of iron), partly within, partly without, the trunk of the skeleton, the skeleton having as a whole been deformed and the vertebral column thrown into a curve by the invasion of the bog by a later landslide on the side where the feet lay.

Owing to the adverse weather of the early spring and the indifferent health of the Secretary nothing further was attempted; and when the fine weather set in time was lost through the difficulty of obtaining the services of the specially experienced workman who excavated the pond-basin. Little progress, therefore, has been made, but the results obtained have added to our knowledge, and go to confirm the inferences which had been drawn from the facts previously known.

Method of procedure:—

(i.) A trench 4 feet deep was driven to the right, and a similar trench to the left, from the line of the present streamlet below the pond well into the undoubted London clay *in situ* behind the "rubble-drift";

(ii.) A trench has been dug below the pond up the line of the ancient gully, which was found completely choked with *remanié* clay of the character of blackish bog-silt. At a depth of four feet below the present surface of the hill-slope a fine angular flinty shingle with several erratics was dug into, clearly marking the line of the ancient gully, which the stream had cut into the flank of the hill in post-glacial times. This was observed to be in a line with similar indications of the ancient line of the stream, across which the trunk of the horse was seen to have lain when it was removed in 1909. It may be said that no one who has had extensive observation of the Eocenes could recognise these phenomena as having anything to do with the London clay, which constitutes the solid geology of the hill behind, as it had been proved in the trial-borings of the autumn of 1909, and exposed in recent excavations for building along the same contour of the hill slope. Of the "finds" from this trench on the arterial line of the ancient gully the following list is given:—

A. Mammalian remains:—

Four very rotten fragments of split marrow-bone, one lower premolar of Equus (broken).

B. Human artefacts:—

Fragment of a gritstone hand-mill, two fragments of extremely primitive half-baked tiles; one clinker; five or six (apparently) "pot boilers"; about a dozen flints, possibly recognisable as "cores" or "scrapers," two of them "patinated."

The erratics from the three trenches include:—

Two good-sized boulders of volcanic ash, small boulder of weathered dolorite, a sub-angular fragment of jasper, four moderate-sized pebbles of vein-quartz, two rolled fragments of coarse white gritstone, a rolled fragment of Röthlschiefer (Permian?), a slab of red ferruginous sandstone (Jurassic?) two inches thick, a slab of white fine-grained sandstone (Keuper?) one inch thick.

To these must be added flints without number, nearly all in a highly weathered condition, some extremely so, several showing the etching action of organic (humus) acids, while others bear unmistakably the marks of long surface-exposure (possibly during the great Miocene elevation) before they were picked up by the early ice, which deposited the glacial drift which caps the hill, and from which these erratics must have been brought down, since the deposit is at a higher level than the true chalky boulder-clay of the district. Eight at least of these highly altered flints have been not only bleached but *scaled,* after the fashion of those brought years ago by Captain H. G. Lyons, F.R.S., from the Egyptian desert. Scarcely a fresh flint was found in the course of the excavations, and it may be inferred that these extremely altered flints have been transported in many cases by ice-agency from Mercian regions far beyond the present chalk escarpment to the basin of the Thames.

The Committee ask to be re-appointed. A grant of £5 is asked for to supplement the local fund, for the purpose of continuing the work of excavation above the pond, and (with the proprietor's permission) extending the operations into the adjoining land.

Note.—This year (1911) extensive excavations connected with public works have been made in the peaty alluvium and the underlying glacial shingle of the Stort Valley. Most valuable "finds" have come to hand from these, including pleistocene mammalian remains, as well as bones of Equus and Bos longifrons, the former tallying remarkably with the bones of the Maple Avenue skeleton. But as these excavations do not fall under the purview of your Committee, they are dealt with in a separate paper communicated to Section H.

COMPETITION NEWS.

Whitley Bay.—The Whitley and Monkseaton Urban District Council recently invited architects practising in Northumberland and the city of Newcastle-on-Tyne to submit competitive designs for the chapels, house and cemetery wall in connection with the new burial ground. Mr. A. W. S. Cross, the assessor nominated by the President of the R.I.B.A., has given his award as follows:—Mr. Ed. Cratney, of Wallsend, first; Messrs. Oliver & Leeson, Newcastle, second; and Mr. Scaife, Whitley Bay, third. The plan of Mr. Cratney has been adopted by the authorities, who have decided to make application to the Local Government Board for sanction to borrow £5,000 for carrying out the scheme.

Mr. G. T. Brown, F.R.I.B.A., architect, Sunderland, has been called in by the Sunderland Education Committee to advise them as to the requirements of the Board of Education in connection with the proposed alterations to the Bede Collegiate School.

The Glasgow Corporation have accepted the tender of Messrs. John Train & Taylor, Dalmarnock Bridge, amounting to £24,592, for the reconstruction of the Corporation art galleries in Sauchiehall Street and Renfrew Street. At the meeting of the Corporation last week a communication was read from the Glasgow and West of Scotland Building Trades Employers' Council with reference to the giving of the whole contract to one firm, who sub-contracted with the different classes of tradesmen. In the subsequent discussion it was explained that the City Finance Committee were in favour of the system of contract suggested in the communication, but as the work would have to be carried out in a small area, and if they did not get the job done in time they ran the risk of losing twelve months' occupancy of the premises, they considered it necessary to have the work in the hands of one contractor, so that they could have closer supervision over him. A Bailie said it was a vicious system. He thought in future all classes of tradesmen ought to have an opportunity of tendering separately for such work. It was pointed out that in such cases the committee were supplied with a list of the sub-contractors by the contractor. The minutes were approved after discussion.

A PAIR OF COTTAGES AT ASHTON

HOLIDAY HOMES.

In the supplement which appears for the first time in the present issue of *The Architect* are a number of designs for small houses which are suitable for use as holiday homes, whether for week-ends or for longer vacations, and we may, therefore, consider in what directions a holiday home should differ from any other.

The idea of a holiday seems to connote a change from one's ordinary method of living, an absence of formality and strict routine, location amidst country or seaside surroundings, and a larger proportion of outdoor existence. It is not necessary or desirable, therefore, that a week-end cottage should be planned on the same lines as a town house or even a suburban villa. Reception rooms are not wanted, but a large and roomy living-room, which will serve not only as a general sitting-room, but also for meals. It makes for picturesqueness and piquancy in such a living-room if there are plenty of bays, recesses, alcoves, or nooks, one of which may be devoted to the dining-table, so that the remainder of the room may afford plenty of clear space for easy chairs and lounges. There should be a corner for the piano, shelves for books, cupboards and other places for putting things.

Besides the general living-room, another, but smaller, one is required where one can be quiet and write letters or have a confidential chat. This may be called a study or a boudoir or, as the Americans style it, a den. Thus our modern week-end cottage will have very much of the character of a mediæval manor-house, with its hall for the general life of the household and its solar for privacy.

A PAIR OF COTTAGES AT ASHTON.

Indeed, an enlarged entrance-hall, with fireplace and sufficient space and cosiness to serve as a sitting-room, is by no means a bad feature in a week-end cottage. But a mere enlargement of the corridor-hall, all passages and doors, will not serve the purpose of the sitting-room hall.

Another fairly satisfactory method of planning the day-rooms is to arrange them en suite, with wide openings or arches between them, so that they become practically a development of the one main living-room, to which the lesser rooms form alcoves, which can be screened off, when occasion requires, by curtains, folding or sliding doors.

The culinary and service departments of a week-end cottage would not greatly differ from that of an ordinary house, save that special care should be given to reduce to a minimum the expenditure of labour. Gas cooking apparatus should always be installed. Even where there is no supply from the mains of a company or local authority, gas cooking can still be employed by the use of a petrol air-gas plant. A hot-water heating apparatus with radiators is also a desirable adjunct to a holiday home, lessening the number of fires that have to be supplied, with their attendant cleaning.

It is not wise to attempt to do without means of warming living-rooms and bedrooms, as such an economy would seriously limit the use of the week-end cottage, and even in summer-time we occasionally get cold nights that make a fire or other heating apparatus rather a necessity than a luxury.

In selecting a site for a holiday home particular attention should be given to the possibilities of water supply and drainage, and the man who intends to build should consult his architect before he buys or rents his land, instead of after. The question of aspect and prospect also demands attention, for although a clever architect can be trusted to make the best of a bad situation, it is far more satisfactory to choose a good one, so that the pleasures of an enchanting view may be combined with the comfort and healthiness of a right aspect for the living-rooms and bedrooms. For the latter it is essential that they should receive sunshine at some portion of the day, and it is desirable that there should be a possibility of variation of aspect. Children's bedrooms, for example, should never face west, although this is quite a desirable aspect for some individuals. In connection with the questions of aspect and prospect comes that of the distribution of windows. Whilst it is desirable to have in a holiday home bright and cheerful interiors, with, where possible, cross lighting, caution is necessary to avoid the house being over-windowed, particularly in the bedrooms.

A holiday home ought certainly to be given a cottagey or farmhouse style of treatment, both internally and externally. The rooms should be comparatively low, which also makes for economy and allows greater area of floor space for the expenditure of any given sum of money. Wood beams or rafters exposed in the ceilings and simple panelling also help the desired effect in internal appearance. Externally, the wall and roof treatment should be regulated by the prevalent local materials; tile and thatch, brick and stone, plaster and half timber, all have their proper place and appear in harmony with their surrounding scenery when they conform to the genius loci and are not imported exotics. As examples of such suitable treatment we illustrate on these pages some characteristic architecture in the Northamptonshire village of Ashton, the rebuilding of which has just been completed by the Hon. N. Rothschild. The cottages are built in pairs around the village green and are fitted with baths, water closets, hot and cold water laid on, and ample space for garden and drying ground. The cottages are occupied by the employés on Mr. Rothschild's Ashton Wold estate at the low rent of thirteen-pence a week, and can therefore scarcely be considered a commercial proposition. Much can often be done by a judicious mingling of material as distinct from the simplicity of these Ashton examples.

PETROL AIR GAS.

EXPERIENCE is now beginning to make itself felt in the possibility of estimating the value of the many different systems and types of apparatus which have been evolved by the ingenuity of inventors or placed upon the market by the enterprise of men of business.

Amongst the various systems described by Professor C. A. M. Smith in the series of articles which appeared in *The Architect* last year was Cox's Air-gas plant. This we have recently had an opportunity of inspecting in actual work. The essential point of the system is that an exceedingly weak mixture, theoretically perfect for complete combustion, is produced by the plant, pro-

THE VILLAGE INN AT ASHTON.

pelled through the pipes, and supplied to the burners, the proportion being 1.4 of hydro-carbon vapour to 98.6 per cent. of air. The truth of this assertion, as far as we are concerned, rests upon the authority of Mr. Charles E. Cassal, F.I.C., public analyst for the City of Westminster, the Royal Borough of Kensington, the Metropolitan Borough of Battersea, and the County of Lincoln; and of Mr. J. Kear Colwell, F.I.C., public analyst for the Metropolitan Boroughs of Finsbury and Holborn, and the Borough of Bedford, Gas Examiner to the London County Council.

It is obvious that a plant which employs a weak mixture such as this must provide motive power for a larger body of air than one which propels a six per cent. or richer mixture. Now if this motive power is to be provided by a weight-driven plant, this means an expenditure of labour in winding up the weights which would be considerably greater in the case of the system using a weak mixture than in that of the richer. Therefore we are not surprised to find that the motive power in the Cox plant is supplied by a hot-air engine driven by the air gas made by the plant itself. Some of our readers may ask what drives the engine before the plant has made its first cubic foot of air gas. Well, at first the air-engine has to be worked by hand, just as a motor-car is started, except that the effort is not so great, though a little longer continued. As Professor Smith pointed out, a hot-air engine scores in that it at once provides a source of heat enabling low-grade or high-density spirits to be used. Thus Cox's plant can use spirit of .720 density, and Shell motor spirit is perfectly well suited for it. Of course some of the petrol, or more properly hydro-carbon spirit, is used to drive the engine; it is not all available for light, but it appears that the positive efficiency in candle-power obtained from the plant is very near the theoretical efficiency of the petrol used.

Then we may consider the relative advantages of a weak mixture and a rich mixture as regards safety. It seems to be fairly well established that a mixture of petrol vapour and air is explosive between the limits of two per cent. and five per cent. of petrol vapour. Hence safety is obtained by the use of either a richer or weaker mixture. The richer mixture may become explosive by the addition of air after escape, just as coal gas becomes dangerous, but in well-constructed plants there is not much risk. The weaker mixture can never become dangerous and hence the product of a Cox plant is absolutely safe and non-explosive.

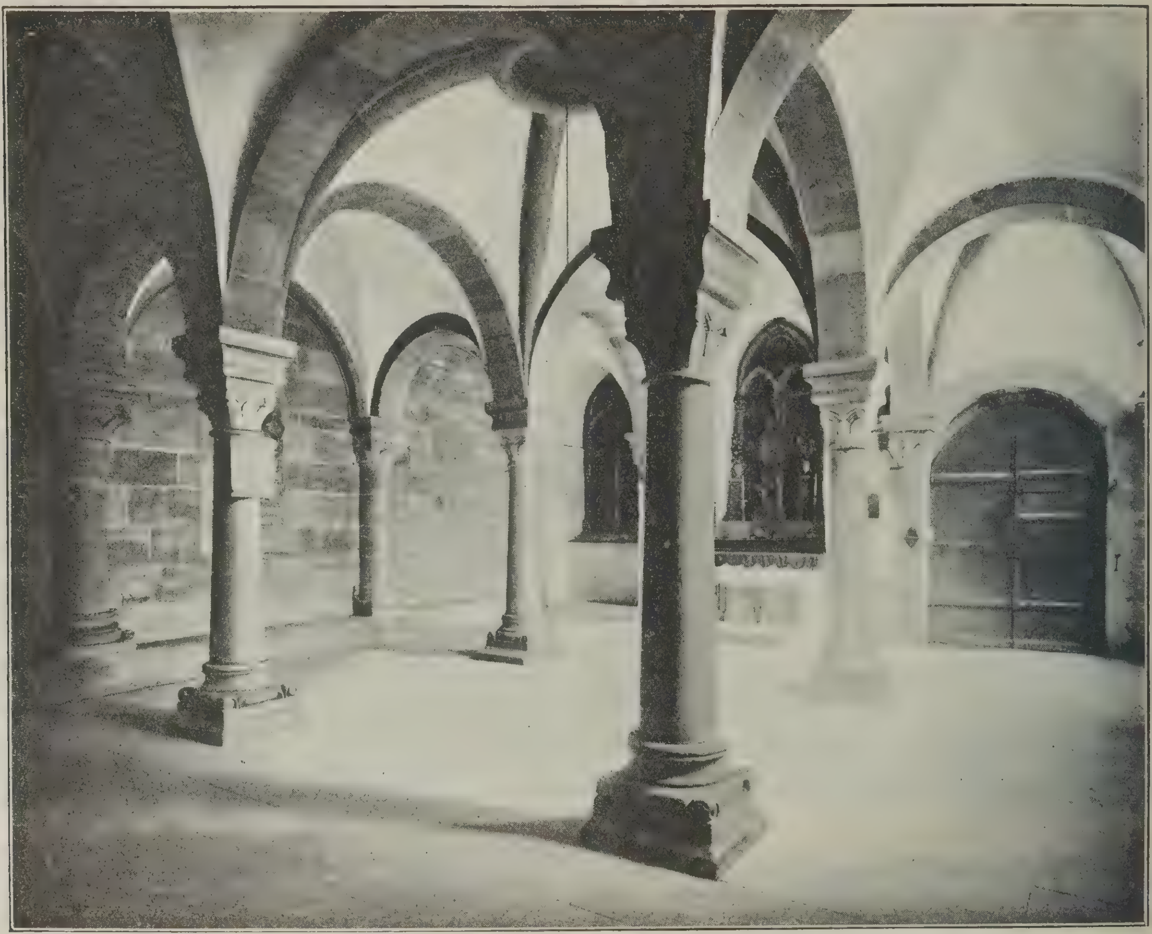
The theoretically perfect mixture supplied by this plant ensures complete combustion of the petrol without any demand upon the air of a room, and it has been proved that a light can be maintained in an apparently air-tight glass case.

As a mechanical apparatus the essential points of the Cox plant are the carburettor, which delivers a dry and perfect mixture of petrol gas and air, and the diaphragm valve which automatically adjusts the supply of petrol and the speed of the hot-air engine to the amount of work required, that is, in other words, to the number of lights that are burning.

The weakness and dryness of the mixture probably furnish the reason for one good point in the Cox system, the absence of condensation in the supply pipes, a fact which appears to have been abundantly proved by severe experiment.

Testimonials are not always of unimpeachable value, but Cox's Air-gas system seems to have stood the test of time, and users of the plant have, after trial, given orders for further installations, in several instances displacing coal gas. Following their experience at Lydd Camp in 1909, the War Office have found the system suitable for the needs of Fort George, Inverness, and have given orders for installations there in 1910, in January 1911, and in the present month.

All petrol air-gas systems of modern type produce light by the use of incandescent burners, the petrol itself being burnt to produce heat only by more or less perfect combustion. Petrol air gas, indeed, effects so considerable a saving on the cost of coal gas or electric current that in many cases, though not in all, the cost of scrapping coal-gas fittings and installing petrol air-gas plant is covered by the saving in a short time. Therefore they can be used for heating and cooking, and for the latter have a great advantage in cleanliness, in which respect they rival the use of electric current. A weak and theoretically perfect mixture such as that produced by Cox's plant is obviously in a particularly good position as regards its adaptability for heating and cooking purposes.



STRASSBURG CATHEDRAL.—CHAPEL OF ST. ANDREW.

STRASSBURG CATHEDRAL.

(*See Illustrations.*)

AMONG the great mediæval churches of Europe the most famous of the French cathedrals are generally, and perhaps deservedly, awarded the foremost place as masterpieces of Gothic architecture; but there are others which, perhaps owing to unfavourable circumstances, have not acquired the celebrity they deserve. And of such is the great cathedral of St. Mary at Strassburg, a building peculiarly rich both in architectural and historical interest, and, indeed, one of the most wonderful monuments of mediæval art now existing.

The present cathedral is the third, if not the fourth, that has occupied the site, its predecessors having replaced a Roman temple since the close of the fourth century. It is remarkable not only as an epitome of the progress of Romanesque and Gothic architecture, but also as distinguishing certain stages of their development by unique departures from contemporary types. In comparing its dimensions with those of other great cathedrals, it is at a great disadvantage in being devoid of a Gothic choir and transepts; but the proportions of the nave, as will appear later, are so ample that, had the church been completed in the Gothic style, it would doubtless have ranked among the greatest cathedrals of the Middle Ages. As it is, the extreme internal length of the church is 328 feet, and the breadth across transepts 182 feet. Its plan may be compared with a number of others drawn to the same scale, which are exhibited in the chapter-house at Westminster Abbey.

The present cathedral dates from 1176, when the earlier church upon whose foundations it stands was destroyed. The work of rebuilding it apparently began at the north transept and continued southwards until, when the walls of the south transept had reached about half their intended height, the style and proportions of the architecture, hitherto Romanesque, abruptly assumed the early Gothic character in which that part of the building was completed.

The plan of the east end is rather remarkable in the length and arrangement of the transepts, and in some other respects, but the choir and apse follow the German plan, and are raised, as in the church of St. Gereon, at Cologne, upon a large undercroft, whose eastern portion is all that remains of the previous cathedral, and probably dates from 1015. The crypt has groined vaulting without ribs, and contains some excellent early Romanesque capitals carved with an interlacing design of the Byzantine type.

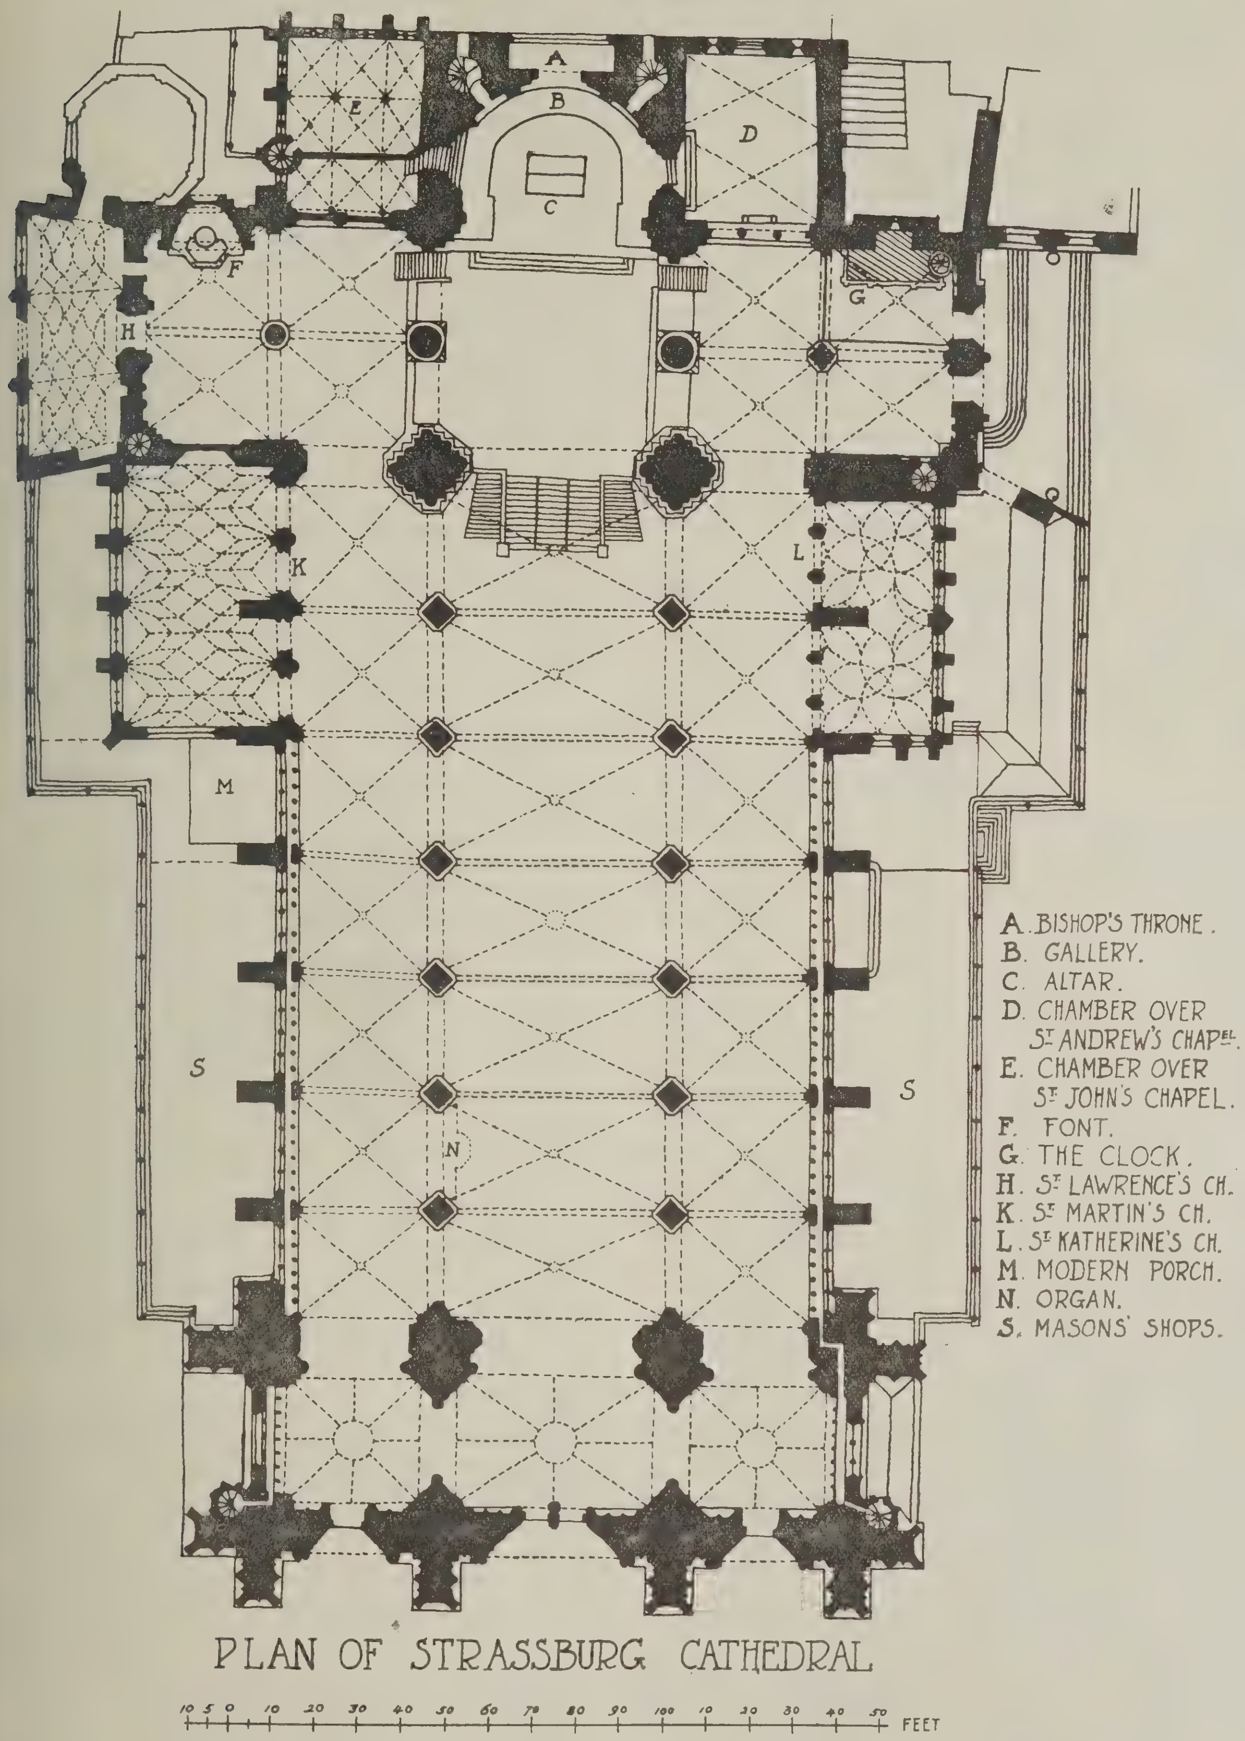
An advance in this style is seen in the chapel of St. Andrew on the south side of the crypt, where a few bays of the vaulting have groin ribs, and the capitals and bases of the pillars exhibit features found in the choir. Interesting examples of early but complete Gothic tracery are seen in the two windows in the east wall. In the chapel of St. John, on the north side of the crypt, the Romanesque vaulting and pillars have been replaced by pure early French work, the latter having the familiar crocket capitals. All the features of this chapel are reproduced in the chamber above, which serves as the chapter-house.

The vast proportions of the choir and transepts give them a singularly majestic and imposing effect. The choir, which is approximately 58 feet square, is raised 7 feet above the floor of the nave, and is covered by an octagonal brick dome reaching a height of 126 feet above the same level, but concealed externally by the modern lantern.

Looking from one transept towards the other, the huge cylindrical columns, 64 feet high and about 7 feet in diameter, together with the massive and spacious proportions and simple architecture, render this Romanesque interior extraordinarily impressive.

The north transept is vaulted in four highly domical quadripartite bays, each having an eye at its apex, which is 88 feet above the pavement. The central vaulting shaft is of very uncommon proportions, being a simple cylinder about 4½ feet in diameter and 64 feet high. Its base is a plain disc, and the capital is carved with primitive foliage.

The illustration of St. Lawrence's chapel shows portions of the two circular windows in the north wall of this transept, which contain an interesting prototype of tracery formed, like examples at Bourges, Peterborough, and elsewhere, of small pillars with capitals and bases, radiating from a central ring, and receiving the feet of sub-arches, which in this case, however, form a kind of cusping, having all the sinuosity, though not the spirit, of Flamboyant tracery. Such features, and the general excellence of the workmanship of this Romanesque building, prove that the



PLAN OF STRASSBURG CATHEDRAL

masons of the twelfth century had by this time attained considerable skill.

The south transept possesses a very good specimen of rich late Romanesque work in the double doorway shown in our illustration. The arch-mouldings are merely receding orders, alternately round and square, but the tympana of the arches and the deep lintels beneath them are filled with excellent and delicate sculpture in high relief, representing the death, burial, resurrection and coronation of the Virgin Mary. Two very good statues of somewhat later date stand upon early Gothic pedestals flanking the doorways, and represent Judaism defeated and Christianity triumphant; the figure of Solomon in the centre is modern.

The vaulting of the south transept, which reaches a height of 82 feet, is supported by a curious Gothic pillar formed of eight shafts attached to an octagonal core, and called the "Angel Column," from the circumstance that figures of saints and angels in three tiers replace portions of four of the shafts. Several of these statues, which are about life-size, are inferior compared with those of the south doorway, and injure, rather than enhance, the slender elegance of the column. They are, however, cleverly designed to subserve the architectural purpose without losing their individual and statuesque character.

It is somewhat remarkable that the Romanesque choir and transepts, vast and majestic as they are, have never given place to more extensive Gothic buildings, but the church was from the beginning a "secular" cathedral, and apparently possessing no relic or shrine of such sanctity as to attract many pilgrims, probably had not sufficient need of extension or improvement to warrant the expenditure involved, the building funds being raised largely by means of special efforts. When, however, these eastern portions were completed the Gothic style had already made its entry, and was fully established when the nave began to be built.

Of the date when this took place nothing more is known than can be gathered from the architecture: the only documentary evidence concerning the matter is that which records the completion of the nave in 1276. The name of the architect is likewise lost, but the design so strongly resembles that of St. Denis, in France, that it is thought to have been borrowed from that church (which was built about 1240), and possibly to have been the work of the same master. The scheme is generally uniform, but the detail of the two eastern and earliest bays is, curiously enough, richer and more elaborate than that of the others.

The great building epoch in France was at that time at its height, and Strassburg, from its geographical position, was very accessible to French influence. In some important points, however, this was without effect, the proportions of the nave being so uncommon that it will be of interest to compare them with others by means of the subjoined table, giving the leading dimensions, in feet, of several typical Gothic naves:—

		Length of Nave.	Width across Nave & Aisles.	Width of Nave.	Width of Aisle.	Height of Nave Vault.	Height of Aisle Vault.	No. of Bays.
Single aisles. No chapels included.	Strassburg	236	121	54	30	104	47	8
	Amiens	175	100	45	27	140	—	7½
	Westminster ...	240	75	33	14	101	49	12
	York	207	106	47	22	—	—	8
Double aisles. No chapels included.	Paris	183	120	42	37	109	37	10
	Cologne	210	146	42	48	147	62	8

(*Note.*—The space beneath the west towers or front is included in the nave, and in the cases of Paris and Cologne contributes two bays to the total length, which is measured to the piers at the crossing. In both these cases the aisles are double, and are, therefore, naturally wider than any others on the list. Most of the measurements have been obtained from small-scale plans, and may not be strictly accurate.)

The extraordinary width and length of this nave, and the fact of its subdivision into only three longitudinal and eight transverse divisions, sufficiently account for the unusually spacious effect and vastness of scale which it possesses. The French influence, so apparent in its architecture, is absent in these proportions, and arrived too early to give to the nave such a towering vault as, by the rule of Amiens and Beauvais, its proportions would have merited, and which exists in the neighbouring cathedral at Metz; though the great span of 54 feet would, perhaps, have prevented this from being attempted at any period.*

It is worthy of note that the apex of the vaulting coincides with that of an equilateral triangle based upon the transverse diameter of the church at the floor level, and this circumstance, whether due to accident or design, gives it a height rather below the normal in French cathedrals, but so much so in relation to its span as materially to aid the large proportions of the building in freeing it from the narrower and more confined aspect of a French interior.

The nave well exemplifies the full Gothic principle of construction, showing the least possible expanse of wall surface and a very scientific disposition and economy of material. Considering the great span and consequent weight of the vault, the buttresses seem remarkably unobtrusive, but here the architect has shown his skill in avoiding an error prevalent among his contemporaries, and instead of seeking to minimise the thrust of his vault by limiting its span, saw in the unusual conditions a factor which actually facilitated the accomplishment of his purpose; for the larger the vault the lower is the line of its thrust, and the shorter the buttresses required to resist it; while the shorter the buttress the less massive need it be. In this way, no doubt, it happens that the buttresses at Strassburg, which support a nave vault of 54 feet and aisle vaults of 30 feet span, are no stouter and much shorter than those of Westminster Abbey, where the width of the nave is but 33 feet and of the aisles 14 feet, while the Strassburg vault is a little the higher of the two. This effect is also partly due to the fact that, owing to the great width of the aisles, the buttresses stand twice as far from the nave as at Westminster, but is slightly discounted by the more obtuse pitch of the Strassburg vault. The same tenuity prevails throughout the nave; the piers are only 6 feet square, though placed on the average 28 feet apart, while the flying buttresses are not more than 15 inches thick.

The great glory of the nave is in its unique display of stained glass, which, though dating from various periods and much restored, is mostly ancient, and of the richest and most harmonious colouring. The clerestory windows, 20 feet wide and nearly 40 feet in height, reach from pier to pier and from the triforium to the vaulting, and are repeated, though with less height, in the aisles; while the back of the triforium, which is a mere passage in the wall, is pierced and glazed, the whole expanse of painted glass forming a truly wonderful spectacle. The slender tracery is of the usual type of the period, and is simply but boldly moulded. That of the triforium is of a more primitive type, and is merely chamfered, while the triforium windows are formed of "plate tracery." The French hand is clearly visible in all these forms, but, excepting in two crocket capitals, it does not appear in the ornamental detail of the piers and vaulting shafts, most of which is of a vigorous and vegetable form, recalling no French work of the period.

The most remarkable fixtures in the cathedral are the celebrated astronomical clock, the organ case, the pulpit, and the font, of which the two last are fine specimens of the richest fifteenth century work.

The clock, which stands in the south transept, is one of the most elaborate of its kind, and is perfectly modern; but it replaces a series of celebrated timepieces, the first of which was made in 1354, and is housed within the case of another, dating from 1574. The case is a ponderous piece of architecture, and is chiefly remarkable in being partly of Gothic and partly of Renaissance design. A small open spiral staircase affords access to its upper parts, and is a fine piece of mason's work.

Hanging on the north wall of the nave, where it takes the place of the second clerestory window, and partly shown in the view of the interior, is one of the few Gothic organ-cases, and the best example of the pendent type, still existing. This unique case, which dates from 1489, is of immense size, nearly reaching the apex of the vaulting, and is richly ornamented with carving and tracery, and brilliantly decorated in polychrome. A full account of the organ was published in the *Musical Times* of September 1910.

The cathedral contains much exquisite workmanship of late style, which well repays a careful inspection, and of which a specimen is seen in the illustration of St. Lawrence's Chapel, built in 1495-1505; a work in which all the eccentricities which characterise German architecture of that period are combined with the consummate workmanship and marvellous intricacy of design which no less belong to the style, and to which, unfortunately, constructive truth was largely sacrificed.

Built of red sandstone from the Vosges, the exterior of the cathedral has a picturesque aspect, but it lacks the chief characteristics of a French cathedral, and owes its imposing appearance chiefly to the mighty west front and tower which form its distinguishing feature, and dominate the landscape for miles around the town. It is with this part of the church that the name of Erwin von Steinbach, incorrectly designated and immortalised by Longfellow as "architect of the cathedral," is associated. He was the first "*Werkmeister*," or "Master of the Works," of whom there is any record, and was probably the author of a design for the west front which is still preserved among other drawings made by his successors; but, although the lower part of the façade was in the main built to this design, Erwin himself only carried out half of it between the time of his appointment in 1277 and of his death in 1318, after which variations were made by his successors, who in 1365 had raised the twin towers to the height of the present platform (217 feet). The upper or octagon tower was begun in 1399, the completion of the spire in 1439 concluding the whole work. No project for completing the south tower in a similar manner appears to have been entertained at any time.

The west front is of extraordinary interest, not only as a work of astonishing elaboration and delicacy, but also as an extreme development of the Gothic principle of piercing spandrels introduced half a century earlier in the windows of the nave, constituting thereby a departure from the course of French Gothic art, and giving the clearest possible expression to the logical and elaborative character of the German mind.

---

* In Spain, however, Seville Cathedral has a nave vault of 55 feet span, and 130 feet high

That the architect had been trained in France seems almost certain, but the presence of the three typically French sculptured doorways must have been due to his deliberate choice.

Beyond these he took a new path, and drew over the massive masonry, as it were, a veil of mullions and tracery of the most refined design and wire-drawn slenderness, standing out sufficiently to allow several galleries to pass behind it, and supplemented by a profusion of pinnacles and canopies rising from and adjacent to the gables over the porches, in various planes. The canopies formerly contained statues, most of which were thrown down during the French Revolution.

The somewhat exaggerated delicacy of the composition was not achieved without some sacrifice of stability, and the tall and slender canopies and pinnacles resist the elements chiefly by the help of metal supports.

The great rose window, 40 feet in diameter, strongly resembles in design that of Westminster Abbey, which is second to it in dimensions. It has a unique feature in the outer circle of delicate crested tracery, 46 feet in diameter, to which it forms the background. The belfry over this window, which does not harmonise in style with the surrounding architecture, did not form part of any design for the west front, nor is the date or purpose of its erection accurately known. It is thought, however, to have been added between 1364 and 1399, possibly in order to buttress the north tower, upon which, at the latter date, the upper structure began to rise.

This tower, which is not part of Erwin's design, consists of eight piers forming the angles of an octagon and surrounded by four slender stair turrets, no two of which are alike, and which, though 140 feet high, are nowhere more than 9 feet in external diameter, and are unconnected with the octagon tower save by footways at the top. The detail and workmanship are very elaborate; the north-east turret contains two distinct staircases, and the octagon tower has a complex stellar vault hidden externally by the spire.

This marvellous structure consists essentially of eight stone rafters springing from the angles of the octagon, and carrying at their juncture an octagonal shaft encircled by a rich gallery, and surmounted by a lantern and cross reaching a height of 466 feet. Upon the backs of the rafters are built six tiers of intersecting hexagonal canopies formed of hexagonal shafts, two of which are common to each pair of canopies, and containing eight staircases, which wind upwards from one into the other. Viollet-le-Duc, in his "Dictionnaire," suggests that the canopies were designed to receive small open spires, and his sketch of the arrangement also shows a statue upon the top of each shaft; but this theory rests solely upon conjecture, and cannot be inferred from any record or from the original drawing of the spire. The addition of over fifty spirelets and more than 200 statues would, indeed, have been a formidable undertaking.

In originality, daring, and intricacy this work is unique in the whole range of Gothic architecture, but the astonishing workmanship contributes little to its general effect at such an altitude, and is almost lost upon the casual spectator. As a monument to the skill of the builders of those days, and as an indication of the course which Gothic architecture was at that time running among the peoples of the German race, this work is, however, of the highest significance and value.

In this short survey of Strassburg Cathedral, much that would have been of interest, both of illustration and of description, has necessarily been omitted, but enough, perhaps, has been given to substantiate the impression received when for the first time the edifice meets the view, the towering front turned to bronze by the setting sun, that of the great monuments of the Gothic era, this, indeed, is among the greatest; and, easily accessible as it is, will amply reward the architectural pilgrim for the trouble of turning his steps towards the ancient and romantic city of Strassburg.

(The author is indebted to Herr J. Knauth, architect to the cathedral, for much valuable information and help in studying the building; to Professor G. Dehio, of Strassburg University, for the plan; and to Herr E. Hartmann, of Strassburg, for kind permission to reproduce his photographs. The historical information is taken from works by Professor G. Dehio, F. X. Kraus, and others.)

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting of the session 1911-12 of the School of Architecture was held on Monday evening last at Tufton Street, Westminster, Mr. Gerald C. Horsley, president, in the chair. Professor Beresford Pite gave the following address on

Architectural Education.

The history of architecture, he said, is that of building construction, the means being involved in the consideration of the end attained. The two elements of architecture, the purport of the building, which involves the civilisation of the race, and the æsthetic ideal and traditions of the builders both finding embodied expression in construction. A genuine architecture has neither of these two elements singly, as it cannot be without purpose or beauty; but it involves their combination under the conditions of the science of building, and, despite the tendency of books of modern architectural history to concentrate attention on religious, civic, or domestic habit, or upon a commerce in traditional architectural forms, the building construction of man in different countries and ages is the field of the true study of architectural history.

The elements of architecture are not really capable of a practical dissociation, though possibly of separate analysis. It would be difficult in any historical review of buildings to eliminate architectural from non-architectural examples, and this is the problem of separating the study of architecture from that of construction. In different eras, and with races in varying measure, the æsthetic or the constructive faculty has predominated. The great era of Grecian art stands for the former, as that of Roman ascendancy does for the latter; but to some extent both are always present, being interdependent, and they act and react as stimulants to the production of fresh architectural developments.

Many instances might be cited to illustrate the necessity of allowing that good building and good art are the same, a quality properly common to both, admirable construction having beauty in building as well as in other workmanships. Construction as an art in entablatures, domes, vaultings, arcades, roofs, staircases, and joinery offers abundant examples which do not permit the disintegration of artistic effect from constructive skill; both elements are practically in operation, and we can only describe the result as beautiful building construction.

Architecture as a constructive art offers a healthy sphere for a new enthusiasm. Ancient buildings will awaken it in those to whom the glamour of antiquity is golden, while others, to whom the practical aspects of modern life appeal more strongly, will find an incentive in the constant development of new requirements of plan and the adjustment by invention and experiment of materials and workmanship.

We shall perceive in the practical application of a definition of architectural beauty based upon beautiful construction that ancient and modern builders alike, when working with devotion, produced results which are satisfying. We shall then enter into a sympathetic union of aspiration (which perhaps may be a new experience), in finding that buildings are the expression of earnest life, and in the revelation of a fresh harmony of thought we shall discover one of the secrets of the mystery of art.

Intelligent antiquarianism and a sympathetic practicality of mind are each valuable as a standpoint for the architectural student, and both are necessary to a helpful consideration of the many branches of study included in building construction. The pursuit of the most prosaic and apparently unattractive of the building crafts is not successfully carried to the point at which the student becomes first a master and then a creator, by merely picking up the latest threads of practice, contented to learn just how the thing is now done in order only to employ a process to attain a result. Building art is not such tame science as this. In every work which issues into real architecture there is scope for earnest investigation of the motives of derivation, and in the pursuit of such studies lie the incentives to further new development or design.

It will be evident, if material and workmanship may be assumed in any view of the art of architecture and that form only is to be considered, that the scenic make-up in stucco of an architectural order or style is a result equivalent to the original construction as an expression of art. The study of form and proportion in an academic classic method, or by the so-called historic periods, which ignore the constructive craftsmanship of building art, is delusive and harmful. Transliterated forms in any rearrangement "freshly designed" may be, are as empty and vague of meaning as the decorative inscriptions composed of disjointed sentences from the Koran employed in Mahommedan building. Unhappily, a knowledge of the forms of architecture and a knowledge of modern building construction, each separately studied, are to a great extent the staple of present-day studies, examination, and practice, and to this imperfect method of education much of the superficiality of design and construction in modern architecture may be justly imputed.

The sense that the architect of a particular building was emphatically the master of his work, rather than the unwilling slave of intractable materials and awkward conditions is so rarely conveyed to the mind by a modern erection other than a simple work of engineering, that the conclusion is enforced that many architects have no genuine enjoyment in their handling of the building crafts, and are unable from want of properly-directed study to express any appreciation of the means they employ to attain their ends in their works.

To the architectural student the remedy for this weakness does not lie in devotion to a new style of architecture, but in a new style of building; not in a fresh revulsion from licence in form to austerity, or in a craze for individualistic ornament. "In quietness and confidence shall be your strength—but ye would not." The remedy is a complete recognition of the artistic value of thorough knowledge and direct purpose in building construction. Genuine interest will be found in the quality of each craft or trade, and the unaffected employment of each for its native or innate beauty, and interest will replace superficiality, and a sense of texture in material and suitability in form will follow. Brickwork can be beautiful both as material and workmanship, stonework in adaptability and freedom of treatment, slating in pattern and quality, carpentry framings and joinery in direct expression of construction.

Full acquaintance with the nature and uses of the materials for which he has to prepare designs, or more exactly in which he designs, is of fundamental importance to an architect. A slight general acquaintance will not be sufficient to ensure the technical sympathy which is recognisable so seldom, but is of such value. A certain knowledge, that does not mistake the quality and peculiar beauty of each material is needed, so that the problem of the design may ally itself directly with the medium of its construction. This harmony, having very much to do with architectural beauty, sound and ingenious construction, will be quite readily seen to have intimate connexion with a right and sympathetic use of material. Constructive skill in unsuitable and unlovely material is as inharmonious as beautiful form badly constructed in a fine material. The art which employs materials successfully in building is as real as that which constructs with permanence and economy. Without construction, building is impossible; but unless exercised in suitable materials, with a proper sense of their nature and serviceableness, fine architecture is equally unattainable.

(To be concluded.)

SUCTION-GAS ENGINES AND PRODUCERS.

A COMMUNICATION presented to the British Association at the Portsmouth meeting, 1911. By W. A. Tookey.

NOTWITHSTANDING that during the last ten years or so a very large number of suction-gas plants have been installed in all quarters of the globe, with satisfaction to purchasers, as is evidenced by the increasing demand for these simple and economical apparatus, it is a fact that figures recording the actual performances with regard to fuel consumption, cost of maintenance, cost of repair, &c., are difficult to obtain. Yet in order properly to appreciate the claims advanced by the makers of gas engines and gas producers it is very necessary that such records should be available, so that comparisons may be made with competing types of motive-power generators, and more particularly those which, according to test figures, would appear to compete very keenly, if not, indeed, to surpass, gas power-plants in reliable and economical working.

The author has collected from his own tests and those available from various sources, representative performances of suction-gas plants of various sizes when under test, not only when the power can be determined by means of some form of brake dynamometer, but when generating electric current—so taking into account the efficiency of the combined gas-electric set—and also when raising water under different "heads," indicating the comparison between fuel consumed and foot-pounds of work performed in such circumstances.

However, inasmuch as "test" figures are usually obtained under what must be admitted to be abnormal conditions—no account being taken of standby losses, wastage of coal in charging, in removal of ashes, &c., the engine and producer being worked at a constant and regular output for but a limited number of hours—further figures were presented which enable the average performances of suction-gas plants of moderate power to be noted. These figures have been compiled from the statements of factory owners in Great Britain and in European countries. They take into account the variations of consumption due to the different grades of fuel used; they reflect the influence of variations of output, of load fluctuation, of length of standby periods, as well as the effect of the variation in the human element in maintaining or otherwise those conditions which make for the best gas-making and lowest consumption of fuel per unit of power delivered.

Mention was made of the recorded performances of suction-gas engines and plants with regard to non-stop runs, as in information of this character it is possible to realise how reliable are these installations and what little attention is really needed, provided always that the engine is properly correlated to the producer and the latter to the quality of the fuel and rate of combustion. Figures representing the consumption of lubricating oil were also given, as being of special interest in view of the criticisms that have sometimes been made in this respect. The experiences of users with regard to the cost of maintenance and repairs were also referred to.

The question of capital outlay was next considered for engines and producers fixed complete upon foundations, with piping and all accessories. No figures were quoted for buildings or space occupied, as, after all, these items, though of importance, vary so much in value that no useful purpose would be served by any assumption.

Having thus dealt with the more important considerations that come under survey in the application of gas power, some attention was given to the comparative costs of operation of liquid-fuel engines of the Diesel type, which, although more efficient as regards utilisation of heat units available in the fuel for conversion to power, yet require several conditions to be fulfilled before the higher economy becomes apparent in the pocket of the manufacturer. Similarly, some points were suggested with regard to the relative performances of steam engines of the high-pressure, superheated, compound, condensing, semi-stationary type, to direct attention to the fact that, although according to test results it would appear that suction-gas plants are threatened by a competitor which offers equal economy of operation, there are claims of a negative kind which must incline the balance of advantages in the favour of the gas power-plant, at all events for moderate powers.

ILLUSTRATIONS.

STRASSBURG CATHEDRAL.—DETAIL OF WEST FRONT.

THIS photograph shows the double plane or veil of tracery which is characteristic of German architecture of the date of the west front of Strassburg, 1276 to 1365. The statues in the jambs of the doorways are ancient, but the carvings in the tympana and arch-rings are modern. The statues of the twelve apostles above the rose window are modern reproductions of the original design.

STRASSBURG CATHEDRAL.—WEST FRONT.

OUR general view of the west front includes the completed tower and spire, which was in progress from 1399 to 1439. The view also shows some typical Strassburg roofs.

STRASSBURG CATHEDRAL.—PORCH OF S. LAURENCE'S CHAPEL.

THE date of this work is 1495 to 1505, which is characterised in German architecture by exuberance of detail and extraordinary skill in craftsmanship. The scene in high relief under the canopy represents the martyrdom of S. Laurence.

STRASSBURG CATHEDRAL.—VIEW OF SOUTH-EAST ANGLE.

THIS shows the change of style in the south transept, the thirteenth century work in nave and aisle, the fourteenth century S. Katherine's Chapel (1331 to 1349) and the modern lantern.

STRASSBURG CATHEDRAL.—INTERIOR OF NAVE.

THE choir and apse seen in this view date from the end of the twelfth century, the nave was finished in 1275, the date of the organ case is 1489, and that of the pulpit 1487. Gobelins tapestry, which is occasionally displayed, is shown in the photograph under the nave arcade.

The photographs from which our illustrations are taken are by E. Hartmann, of Strassburg.

[From *The Architecture of the Renaissance in France.*

FONTAINEBLEAU: PORTE DAUPHINE OR BAPTISTERE DE LOUIS XIII. (C. 1600).

HE ARCHITECTURE OF THE RENAISSANCE IN FRANCE.

LTHOUGH it is true that throughout the whole
period during which the architecture of the Renais-
ice was the prevalent method of design in France
lian influence and precedent were of ever-renewed im-
tance, there is throughout a distinctive difference
ween the work of the two countries sufficient to justify
term French Renaissance architecture. It is there-
e a matter of some surprise that up to the present
ere has not appeared any work in the English language
aling exclusively and fully with the Renaissance archi-
ture of France as a whole. Partly, no doubt, this has
en due to the immensity of the field, partly to the
stence of excellent monographs dealing with some por-
n of the subject or some selected group of buildings.
e omission has, however, now been rectified by the
plication of Mr. Ward's new book,* in which are
hered together the fruits of indefatigable research and
e selection of examples.

As the title page informs us, Mr. Ward's work is a
tory, and he therefore deals with the subject of the
ench Renaissance historically. In so doing he recog-
es various phases in the development of French Renais-
ice architecture and classifies these as "styles" asso-
ted with the names of the several monarchs whose
gns happened to coincide with the manifestation or
mination of the various tendencies connected with
h particular phase of development. Thus we have the
le of Louis XII., in which there was an attempted fusion between Lombard Renaissance and Flamboyant Gothic; the style of Francis I., in which the fusion between the native style and Lombard Renaissance was completed; the style of Henry II., wherein is shown the influence of Roman Renaissance; the styles of Henry IV. and Louis XIII., which Mr. Ward considers to be marked by utilitarian architecture and rival tendencies of Netherlands-Barocco and Roman classicism; the style of Louis XIV., showing Barocco-Palladian compromise and "The Grand Manner"; the style of Louis XV., characterised by Rococo-Palladian compromise; the style of Louis XVI., which saw a puristic reaction and the beginnings of archæological tendency; and finally the style of the Empire, with its dominant archæological classicism.

We are inclined to think that Mr. Ward's epitome of the tendencies of the various styles is open to criticism. For example, we cannot agree with him in his ascription of the influence of Netherlands-Barocco on the styles of Henry IV. and Louis XIII., but we find sufficient evidence in such work as that of Il Rosso at Fontainebleau for the Italian origin of the characteristic detail of this period. Even in the style of Henry II. there are indications of the influence of the decadence which had commenced in Italian Renaissance, an influence to which Mr. Ward himself alludes.

In dealing with each successive style the author treats of the political and social activities of the time, the relative influence of the foreign and native artists employed, the principal buildings showing work of the period under review, both secular and ecclesiastical, and the characteristic treatment of the various elements, features and details of the buildings of the time. We are struck with the cautious manner in which Mr. Ward deals with the authorship of the design of various buildings, though it is evident that he has devoted much time to the research of documentary evidence wherever it has

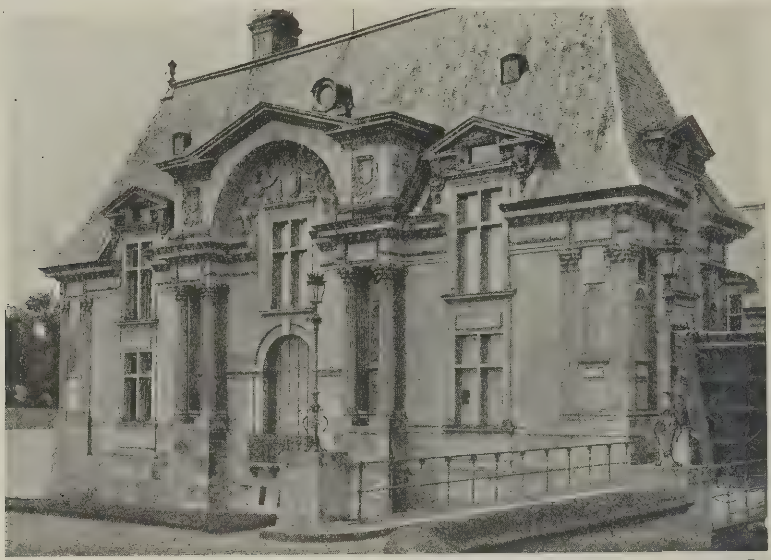
* *The Architecture of the Renaissance in France.* A History of
Evolution of the Arts of Building, Decoration and Garden
ign under Classical influence from 1495 to 1830. By W. H.
rd, M.A., architect, Associate of the Royal Institute of British
hitects. Author of "French Châteaux and Gardens in Six-
nth Century." In two volumes. (London: B. T. Batsford.
net.)



[From *The Architecture of the Renaissance in France.*

CHANTILLY: "THE CHATELET" BY JEAN BULLANT.—ENTRANCE FRONT.

been available. His attitude may be gathered from the passage "Systematic research is now putting the facts in clearer light, and if the extent of each man's work is still uncertain, it can at least be determined what it is possible he may have done."

As a fruit of Mr. Ward's research we have brought before us some interesting episodes in the architectural life of France during the Renaissance period. Thus we are shown the competition designs for the east front of the Louvre by Le Mercier, J. Marot and Bernini, as well as Perrault's original scheme. We see also the south front of the Louvre as completed by Le Vau before its alteration by Perrault.

It is, indeed, a feature of Mr. Ward's two volumes that whilst they are profusely illustrated by excellent photographic views of existing buildings, in whole or in detail, we have reproductions of original drawings and engravings of buildings that have been demolished or altered, and also designs that have not been executed, but which are of high value as illustrations of the trend of thought in architectural design, and sometimes perhaps of what architects would have wished to do if they had had the opportunity.

Thus we have in these two volumes a clear and comprehensive account of the architecture of the Renaissance in France as a whole, scholarly and complete, admirably and fully illustrated.

By the courtesy of the publisher we are able to reproduce some of the illustrations in Mr. Ward's book.

NOTES AND COMMENTS.

We are pleased to learn that a lectureship in civic design and town-planning has been established at the Birmingham University. The cost will be defrayed by the Bournville Village Trust, which was founded by Mr. George Cadbury to encourage schemes of betterment and improved housing generally. Mr. Raymond Unwin, F.R.I.B.A., has accepted the lectureship for the first year, and will begin his course during the present session. The lectures to be given at the University are at first to be associated with the Department of Civil Engineering, wherein are students training for civic and municipal service; but it is hoped that students in other faculties, especially those working for diplomas in Social Study, as well as persons interested in architecture and in civic improvement generally, will take advantage of them. Mr. Raymond Unwin and Professor Adshead, of Liverpool University, represent two distinct schools of thought in town-planning, and therefore it is very satisfactory that the choice of a lecturer for Birmingham University should fall upon Mr. Unwin, who has shown that he is well equipped
with a knowledge of wide extent in what has been d
in town-planning, even if his personal predilections
opposed to those of his colleague at Liverpool.

It is a pity that there are not more public spirited l
associations interested keenly and watchfully in the
servation of our ancient monuments like the Trustee
the Bath Municipal Charities, who undertake to rec
and wisely expend money entrusted to them. At
last monthly meeting of the Trustees it was reported
the Master had received the sum of £40 10*s*. to be
pended upon the restoration of artistic features of bu
ings. £20 of this sum had been specially allocated
the restoration of the doorway of Beau Nash's ho
The remainder was for the restoration of Bishop Butl
house.

Electricity is a good servant but a bad master, an
cannot be too widely known that installations of ele
lighting require periodical inspection as well as car
and conscientious workmanship in order to ensur
reasonable degree of safety. Sutton Hall, Thirsk, wl
contains some magnificent specimens of antique furni
and a large collection of Morland prints, probably
finest in the North of England, narrowly escape
destructive fire last week from the fusing of electric l
wires in the dining room, which is panelled with wo

Mr. S. E. Burgess, the Borough Engineer and
veyor for Middlesbrough, has submitted to the Midd
brough Streets Committee the draft of a town-plan
scheme for the borough. In this scheme the area t
laid out was 810 acres, or 1¼ square miles, and
divided into the following districts:—Longlands, B
Vue, Grove Hill, Parkside, North Acklam, and S
Acklam. From Acklam Road to Marton Road he
gested a new 60 feet road in three sections to be na
the Mill Walk, Tollesby Road, and South Bar. This
would form the Boulevard or Ring Road. Along
course of Marton Beck he suggested that the land sh
be laid out for plantations and public walks, and par
with the plantations and Marton Beck roads shoul
made. With regard to building sites, no back streets
proposed. The number of houses to be erected to
acre was suggested at eight or less for the better c
houses, and not to exceed eighteen or twenty for the o
kinds of dwelling-houses. Open spaces were to be
at various places, particularly on the main roads.
residential roads were to be laid out in the form
crescents and rectangles to suit the conditions of
land.

ENTRANCE OF DUCAL CASTLE, NANCY (1501-12).

Despite a certain amount of opposition the Corporation f Glasgow has wisely adopted the following resolution :— That it be remitted to a special committee to consider nd report on the necessity and expediency of the Corpora- on, in view of the provisions of the Housing, Town- 'lanning, &c., Act, acquiring the available ground on ach side of all the main roads leading into the city for uch distances from the boundaries of the city as may be etermined, with the view of enabling the Corporation to 'iden such roads and carry out the spirit of the said ct.'' The mover of the resolution, in making his pro- osition, pointed out that if the motion had been passed even or eight years ago the Corporation would have had ll the available ground leading into the city at a very uch cheaper price than they could get it to-day. Before ne cars went beyond the outskirts of the city ground was eing feued at £12 per acre, but whenever the cars went ut the cost rose £60, £70, and £80 per acre, and even igher in some cases. What he suggested would ulti- ately have to be done by the city. It had been done n Berlin, where they had received more in profit than ne ground originally cost the community. Foresight is ne essence of success in town-planning and the wider ne view taken by local authorities to-day the greater will e the benefits obtained in the future.

Sir James Crichton-Browne, in an address at the opening of the Tuberculosis Exhibition at Glasgow, expressed the view that tuberculosis was really with them a house disease, and it was by amending the housing of our people that they might best combat it. It was fresh air in the surroundings that was the pressing necessity in relation to tuberculosis. Commercially in Great Britain we were the consistent advocates of the open door, but there seemed to be still a national prejudice against the open window. Warmth before oxygen had been the motto, and there was still a widespread ignorance of the virtues of ventilation and of the invigorating effects of cool, dry air, even when charged with a larger percentage of carbonic acid than had hitherto been thought desirable. The windows and the chimney were the ordinary means of ventilation, but there are many of the older houses in Scotland in which the sashes of the windows were unhung, and were therefore difficult to open, and many containing rooms without a fireplace. In the interest of the abolition of tuberculosis all corporations should henceforth exercise the powers they possessed in approving the plans of new houses to disallow rooms without a fireplace or ventilating shaft; and one of the beneficial results of this exhibition would be, it was to be hoped, to rouse the people to make adequate use of such means of ventilation as they commanded.

ROUEN: FONTAINE DE LA GROSSE HORLOGE.

The Incorporated Church Building Society has collected and issued in pamphlet form some warning notes on cheap churches which should be in the hands of every promoter of church building. In this is pointed out clearly the falsity of the view that it is possible to build a "cheap" church which shall be worthy or sufficient for its purpose.

A daring scheme is proposed for Hove in the shape of a pier 1,300 feet long with a large building at the seaward end to contain a theatre, a kursaal, and a hotel, with bedroom accommodation for 464 visitors. If this is carried out as suggested there will be a fine opportunity for enjoying sea breezes, but south-westerly gales raise a heavy sea at Hove and nervous persons will be likely to suffer considerable apprehension from the inevitable vibration, to say nothing of the noise of breaking waves.

THE VICTORIA AND ALBERT MUSEUM.*

THE opening of the new buildings marks a new era in the development of the Museum; in order to realise what is the precise significance of the changed conditions it will be well briefly to review the past history of the institution.

The Victoria and Albert Museum owes its origin to the Museum of Ornamental Art established at Marlborough House in 1852. This comprised a series of casts of ornamental art of all periods, specimens of manufactures, &c., which had been purchased since 1837 and stored in Somerset House, and a selection of objects purchased in 1851 from the Great Exhibition of that year, together with loans from Her Majesty Queen Victoria and other contributors.

HISTORY OF THE BUILDINGS.

In 1857 the Marlborough House institution, together with the Department of Science and Art, was transferred to South Kensington, and from this time became known as the South Kensington Museum.

As time went on the primary purpose of the Museum—the encouragement of design and ornamental art—became somewhat obscured, partly from the close association with science and the more commercial side of manufacture; and partly from the gradual extension of scope which had taken place in the acquisition of objects.

Between the years 1865 and 1884 various portions of the collection other than those relating to art were gradually removed, some to Bethnal Green and some to the galleries on the west side of Exhibition Road, until in 1887 the art collections were left in sole occupation of the buildings on the east of Exhibition Road. In spite, however, of the relief thus afforded, the congestion caused by the insuffic ency of exhibition room presented an ever-increasing dif culty.

In 1890, after prolonged consideration, a scheme for ne and enlarged premises for the Art Museum was complete Various architects were asked to submit plans for the pr posed new buildings, and in 1891 Mr. (now Sir) Asto Webb's designs were selected.

It was not, however, found possible to proceed with th scheme until 1898, by which time a modification of t original plans had become necessary in consequence of t decision of the Government to transfer to Whitehall t administrative staff of the Science and Art Departmen offices for which, at South Kensington, had formed a co siderable part in the original scheme. The modified pla for the new buildings for the art collections were consider and settled by a committee in consultation with Sir Ast Webb, and upon May 17, 1899, the foundation stone was la by Queen Victoria of the institution which, by Her Majesty directions, was in future to be styled "The Victoria a Albert Museum." In January 1909 the new galleries we completed. The transfer of the collections began at onc and sufficient advance was made with the rearrangement admit of the building being formally opened by Ki Edward VII. on June 26.

COMPARISON WITH SIMILAR MUSEUMS.

The Victoria and Albert Museum, as it now stands, in point of size, the largest existing institution of its ki in Europe or America. Some idea of the actual spa covered may be gathered from the fact that in the n building alone the galleries have a total length of just o mile, beside the top-lighted courts, which cover nearly acres. With the exception possibly of the Louvre no oth museum approaches these dimensions. Moreover, in a comparison of this and Continental museums it must a be borne in mind that there is hardly any other muse which aims at precisely the same scope or function as th

The primary scope of the Museum, as has be already stated, was that of providing instruction in desi and ornamental art, of stimulating and improving "su manufactures and crafts as require and admit of decorati design." Broadly speaking, this purpose has been kept view throughout, but in some directions, partly in con quence of a certain vagueness in the original definition purpose, and partly from a fear of losing important objec the limits originally indicated have become more extende

On the other hand, the larger museums on the Contine and in America are, for the most part, general museums art, intended for the enlightenment of the public; they affo opportunities for the study of art and its history, but a not, as a rule, designed to meet the special requirements students of industrial and decorative art. Thus, the Louv in some degree combines the functions of the Briti Museum, the National Gallery, and this Museum; t Kaiser-Friedrich Museum at Berlin has the collection pictures combined with a collection illustrating the a of the Renaissance. Indeed, practically the only Contine tal museum of importance covering the same ground as th does is the Austrian Museum for Art and Industry Vienna. This museum, originally erected in 1868 to conta collections which had been founded on the plan of the Sou Kensington Museum, and since greatly enlarged, prese on a smaller scale much the same scheme both of scope a arrangement as this Museum; it has its own library technical works and its lecture room, and connected with by a covered passage is the School of Arts and Crafts (Kun gewerbe-Schule), a building of nearly the same size.* T Kunstgewerbe Museum at Berlin has a similar provision students in an adjoining building; it has many points similarity with this Museum (though the principle of rangement is different). It includes very little sculpture architecture, and no paintings. That museum, again, is a much smaller scale.

ARRANGEMENT OF THE COLLECTIONS.

The question has been much debated whether the ma basis of arrangement of a museum of this character shou be that of material or of period. There is undoubte much to be said for both principles, and it can hardly asserted that any unanimity of opinion on the point has been reached. On the Continent generally the histori method is preferred, Vienna and Stuttgart being nota xceptions in favour of the "material" system; but even n the principal "historical" museums, as at Berlin and Iunich, it is found in practice necessary to adopt a subidiary arrangement—usually in a separate part of the uilding—of exhibits grouped by material. As a general ule these museums are intended to afford opportunity for tudy to the student of art and history, but do not take into onsideration the special requirements of students of industrial and decorative art. The decision of the Board in 1908 o arrange the Victoria and Albert collections according to aterial, and the correlated decision to establish eight eparate departments were in accord with the avowed rimary aim of the Museum, that of providing facilities for raftsmen and students.

---

* Extracts from the report by Sir Cecil H. Smith, director and secretary of the Victoria and Albert Museum, for the years 1909 and 1910.

* The heads of the different departments of the museum sent round to lecture at local specialised exhibitions, partly w the definite object of keeping the central institution in touch w the manufacturers.

The work of transferring and rearranging the exhibits egan as soon as the first portion of the new galleries became vailable. It was carried out generally on the lines laid own by the Committee of Rearrangement, 1908, as regards e principle of arrangement by material; but one or two odifications of the committee's recommendations in regard the allocation of rooms to departments were found to be ecessary as the work progressed.

A further considerable rearrangement of some parts of e collections was involved in 1910 by the acquisition of the alting Bequest. Under the terms of Mr. Salting's will was necessary that the whole collection should "not be stributed over the various sections, but kept all together ccording to the various specialities of my exhibits."

Utilisation of the Additional Space.

The amount of exhibition space available in the old uildings of the Victoria and Albert Museum (exclusive of e Oriental Galleries in Imperial Institute Road and the ibrary) was approximately 135,000 square feet. The additional space provided by the new buildings is approximately 0,000 square feet, or nearly 1½ times as much again. his great increase of area might seem to indicate that the useum is now provided with more than sufficient room to eet the natural expansion of the collections for many ears, but, as a matter of fact, it will be found that when l the collections requiring exhibition have been finally set t there will even now be very little, if any, space to spare. is true that in some places, as, for instance, in the east d west halls, while the walls are almost completely vered, the floor is at present but little occupied with hibits—greatly, it may be said, to the gain of the great chitectural monuments, which can be seen and studied in eir most instructive and artistic point of view as indi- dual units; but this open spacing can only be regarded as luxury of the moment, as a number of objects (mostly quisitions of long standing) are now being prepared for hibition, for which this floor space will be required. oreover, it must be remembered that before the move into e new buildings the collections were one and all exceedingly ngested. In order to estimate what this congestion was, is only necessary to compare the space occupied by some the collections in the old building with that which they l to-day.

Casts.

One of the problems arising out of the rearrangement of e collections which still remains to be settled is that of e disposal of the large and important collection of casts, ainly from architectural originals, which are housed for e most part in the Square Court, and, indeed, the whole estion of including casts in a museum of this type.

The regulations of 1863 directed that "where original ork could not be procured, the system hitherto pursued of presenting the finest known examples by electrotypes, sts, and drawings will be followed, it being always kept in ind that the aim of the Museum is to make the historical d geographical series of all decorative art complete, and lly to illustrate human taste and ingenuity." It is not together surprising that with so generous a programme the useum authorities soon began to find themselves pinched r space; and a reduction of the cast collection speedily llowed: in 1866 the Council of the Architectural Museum Tufton Street were requested to remove those casts which ere not required for the Museum; the Council, however, eferred to take away the whole of their collection. The llecting of casts, however, went on apace; in 1874 the eat Architectural (now "Square") Court was completed, d one-half of it was at once nearly filled with the cast of rajan's Column. In 1881, at Mr. Walter Perry's sugges- on, it was decided to form a collection of casts of Classic ulpture illustrating the history of Greek art "though some- hat outside the scope and object of the Museum." In 1907 this large collection (then occupying the entire South Corridor) was transferred to the British Museum.

In a museum of this character, which aims at representing the continuous development of various crafts and artistic processes from an educational standpoint, it is obviously difficult to effect this purpose by means of original specimens alone. In some cases, at least, gaps will occur, and in order to fill these recourse must be had to casts, electrotypes and photographs. As regards photographs and electrotypes, space for this purpose can usually be found without much difficulty. Casts, on the other hand, being as a rule of some bulk, have to be specially considered. Given the necessary space, it is probable that the most satisfactory result would be obtained by acquiring just so many as are needed to fill gaps, and arranging them in their places among the originals. The objection to this course is that either the cast must be coloured to look like an original, in which case a mistaken impression may be conveyed, or the cast is left in its natural colour and an unpleasant, staring effect is produced. In Paris, Berlin, and Munich the practice has long been followed of installing as complete as possible a gallery of casts in a separate building in reasonable proximity to the collections of originals. But if the whole body of casts is treated as a separate and supplementary collection, the question at once arises, how far this segregation of casts is to be carried.

Purchases.

The great increase in the prices realised by all works of art within recent years makes the problem of acquisition by purchase one of serious moment. As regards the collections of this Museum it may be said that, taken all in all, they represent a series which will bear comparison with those of any other existing institution. The English authorities had the advantage of being early in the field, and bought at prices which often appear almost ludicrously small in the light of present-day experience. Assuming that the limits of what has been done by designers and craftsmen in the past were known, it might be supposed that a collection so formed would by this time have attained a standard of at least approximate completeness. But even on this assumption the contention is not justified. The rearrangement of the collections in precise classification and with a more adequate spacing has thrown into clearer relief the more obvious gaps which exist in every department; and these gaps alone, in the increasing competition of to-day, must take many years to fill. On the other hand, if the Museum is to serve its purpose not only as a great central repository of industrial and ornamental art, but also that of an organising centre for affiliated institutions of a similar nature throughout the Kingdom, it is obvious that the demands on the purchase grant will in any case not diminish.

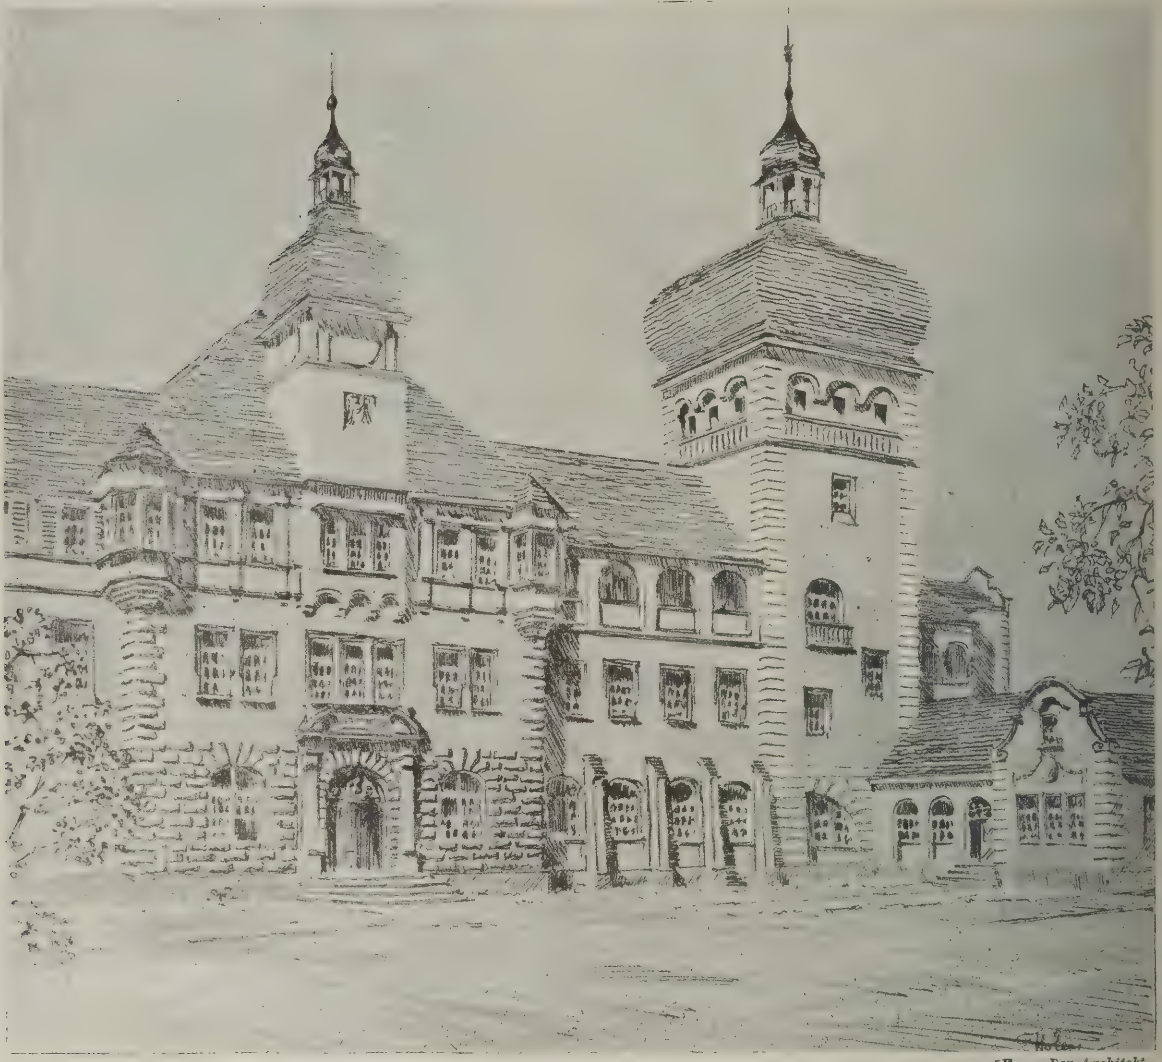
And, as against this, we are faced with the increasing difficulty of cost. The inflation of auction-room prices, to whatever cause it is due, has practically left public institutions, with their strictly limited means, deprived of any chance of success in open competition. The day for bargains is past when every corner of Europe is being ransacked by dealers and when the transactions of the auction room and the prices paid are the common subject of conversation. Nor is it only with the famous masterpieces that the difficulty is making itself felt; the inflation has affected more or less every range of art collection, partly from contagion and partly because of the multitude of speculators who have sprung up in consequence of it.

Loans.

The principle of accepting objects on loan for various periods has from the first been followed in the Museum, and from 1862 onwards special loan exhibitions of particular branches of art have from time to time been organised. This principle has on the whole been found advantageous; in many instances objects at first deposited on loan have become the property of the Museum; gaps in the permanent collections have been temporarily filled; and the authorities have been brought into touch with specimens which might otherwise have escaped their notice. It is interesting to note that the French authorities have recently adopted a similar principle; it is understood that they base their action on the ground that by this means the public are permitted to enjoy fine things which would otherwise be unknown to them, and that the relations between the museums and the amateurs are thus drawn closer. A condition is strictly observed that no object is admitted which is of mediocre quality or even suggests any connection with commercial advertisement.

MODERN EUROPEAN ARCHITECTURE.

AUSTRIA.



[From *Der Architekt*.

DESIGN FOR A MUSEUM AT INNSBRUCK.—By Dr. Karl Holey, of Vienna.

Until 1909 the practice had been followed of exhibiting loans among the main collections. On the other hand, there is much to be said for an isolated exhibition of objects on loan.

The large Octagon Court adjoining the Exhibition Road entrance was finally selected for the purpose of a loan court, chiefly because from its structural character and position it seemed to offer most suitably the space required and to be most easily detachable as a unit from the main scheme of arrangement. On the other hand it offers only a limited amount of wall space, and it possesses no windows on the lower level. It has therefore been found necessary to overflow in two instances; the fine series of stained glass windows lent by Mr. Pierpont Morgan has been erected in front of the adjoining windows of the South Corridor, and the series of four tapestries from Hardwick lent by the Duke and Duchess of Devonshire are exhibited in the Central Court.

Decoration and Reconstruction.

The decoration of the walls, &c., of the new building, with the object of providing an appropriate setting to the various groups of objects comprised in the collections, is a problem recognised as one requiring careful consideration. As the structure is not yet in a condition suitable for permanent decorative treatment, colour has as yet been applied only in a temporary manner where it was considered necessary, and the greater part of the wall space has for the present been left uncoloured. In August 1909 a suggestion for the decoration of the walls of the Octagon Court, accompanied by the generous offer to paint one of the large lunettes for the cost of the materials and scaffolding, was received from Mr. Frank Brangwyn, A.R.A. After careful consideration his offer was declined. It was held strongly that the chief decoration of a museum such as this should be the exhibits themselves, and that the decoration of the wa should assist the lighting where necessary, but should r otherwise challenge attention. It is intended to apply t principle throughout the new buildings when the final de rative scheme is taken in hand.

During the year 1910 considerable progress was made replacing the heating and lighting arrangements in the ol part of the building by a more modern system, and in t provision in the picture galleries of new fireproof roofs. T new roofs are so constructed as to admit a north light on

UNIVERSITY OF LONDON LECTURES O ARCHITECTURE.

MR. BANISTER FLETCHER, F.R.I.B.A., will comme a course of twenty-four University Extension lectu on "Ancient Architecture" at the British Museum (by p mission of the trustees) on Tuesday, October 3, at 4.30 P. Also a course of twenty-four lectures on "Renaissa Architecture" at the Victoria and Albert Museum (by p mission of the Board of Education) on Monday, October at 5 P.M. These courses are to be fully illustrated by lant slides, photographs, diagrams, and models. They will peal not only to architects, but to all lovers of art and public in general, to whom a knowledge of architect enhances a hundredfold the pleasures of travel. T Museums, which seem the natural home for a series of su lectures, abound in ancient and Renaissance examples, whi will be visited and explained by the lecturer during the cl held at the end of each discourse. Attendance at the fi lecture at each Centre is invited, free of charge. Full p ticulars can be obtained from Miss Gaudet, 120 Chey Walk, Chelsea, S.W.

HAUS AST" IN THE HOHE WARTE, VIENNA.—Professor Josef Hoffmann, Architect.

MEMORIALS OF PREHISTORIC MAN IN HAMPSHIRE.

A communication presented to the British Association at the Portsmouth meeting, 1911. By W. Dale, F.S.A.

THE memorials of prehistoric man in Hampshire are connected, firstly, with the great beds of gravel which occur by the sides of its rivers and principally near their mouths. The gravel beds of the Avon from Milford Hill in Wiltshire down to Christchurch in Hants, and the cliff sections at Barton and Milford, at Hillhead, not far from Portsmouth, and at a point in the Isle of Wight nearly opposite, have all yielded Palæolithic implements in great variety. No district is, however, more prolific than the Valleys of the Itchen and the Test. In the gravel pits of the Southampton delta, which is covered with deposits from the rivers, we can see a mass of material from fourteen to twenty feet thick resting upon Bagshot or Bracklesham beds of Eocene Age. The material is nearly all sub-angular flints, with here and there a piece of sarsen or a hardened mass of Bracklesham fossils.

The great age claimed for these gravel beds and for the associated implements is confirmed by the existence near Southampton of several streams which have cut for themselves secondary valleys of great depth right through the gravel since it was deposited and through the underlying beds. One of these valleys, at right angles to the Itchen near St. Denys, attains a depth of about fifty feet. When the Roman station of Clausentum was placed on a bend of the Itchen at the bottom of the valley the physical conditions of the neighbourhood were the same as they are to-day.

The implements gathered from these gravels are of great variety and are representatives of all the various forms into which palæoliths can be classed. At the same time it is not possible to pick out certain forms and allocate them to distinct horizons as is now done by many on the Continent. There are also many rough and intermediate forms which would be called Eoliths by some.

Passing to the Neolithic period, Hampshire gives no evidence of any intermediate stages or anything to bridge over the great physical and palæontological gap which separates the two periods. As might be expected in a country where flint is abundant Neolithic implements are plentiful and specimens of almost all the types known elsewhere in Britain have been found. The most common implement, apart from the simple form, is the roughly chipped celt. Celts, very finely chipped, and also those partly or wholly polished, are also found. True arrow-heads, either barbed or leaf-shaped, are not common. Along the coast several small celts of green stone have been found which look like imports from the Continent. Apart from the implements, undoubted relics of Neolithic man are few in Hampshire. A few long barrows exist in remote parts. One destroyed on Stockbridge Down some years ago contained an unburnt burial in a crouched form. Most of the conspicuous hills are crowned by defensive earthworks, and some of these probably date from Neolithic times. One of the finest is Danebury, near Stockbridge. The inner, or principal, vallum rises thirty-two feet above the ditch, and there is an elaborate system of banks defending the openings. A better known earthwork is that on St. Catherine's Hill, Winchester, which may belong to the Bronze Age. Many of the sides of the downs have "lynchets" or terraces of cultivation which are of uncertain age. The only megalithic monument in the county is on the western side of the Isle of Wight and is called the "Longstone." It was evidently originally a dolmen. One stone remains upright, and the companion stone lies by its side. Barrows of the Bronze Age are very abundant. This is particularly the case in the New Forest, where one may look over vast tracts of country unaltered since prehistoric times, save for the existence of the Scotch fir. Many hoards of bronze implements have been found in the county, and single specimens are not scarce. Some of these are of an early type. One is an early dagger of the type from which the spear-head was evolved. A very early flat celt, belonging to

Period 2 of Professor Montelius, was also found near Southampton. This is of a type now commonly found in Ireland. A short square socketed celt and a lance-head with loops, cruciform in section, both also have Irish affinities and may be regarded as relics of that time in the Bronze Age when there was commerce between Ireland and Scandinavia, and Southampton was a convenient port of call.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) contains an illustrated article on the Exposition Buildings in Rome. The principal plates are devoted to four houses designed by Mr. George O. Totten, jun., for the Hon. J. B. Henderson, and erected in Upper Sixteenth Street, Washington. These houses are intended for Embassy buildings, and two are now occupied by the Swedish and Danish Legations.

Berliner Architekturwelt (Berlin) is this month almost entirely devoted to domestic architecture, country houses, suburban and town, single family houses and flats. There is also an interesting illustrated article on the architecture of Old Berlin, as represented by painters.

Construction (Toronto) has for its best features this month illustrated descriptions of two recently completed works in Great Britain, the Queen Victoria Memorial and the Chapel of the Knights of the Thistle. There is also a fully-illustrated paper read by Mr. Philip J. Turner, F.R.I.B.A., before the Quebec Association of Architects on the mason's art of the Middle Ages. Three houses in Toronto are illustrated, but they are not overwhelmingly beautiful.

Deutsche Bauzeitung (Berlin) gives further illustrations of the town hospital at Rixdorf, and an account, with view and plan, of the new Rathaus at Wittenau, near Berlin. Specimen pages and illustrations are included of a forthcoming book published by our contemporary, "Das Deutsche Bürgerhaus," which will be in five volumes containing 390 plates.

Stone (New York) issues a full-plate view of the monument of Beato Pacifico (died in 1437) in the church of Santa Maria Gloriosa dei Frari, Venice. An illustration of a well-head of Carrara marble in a Venetian palace courtyard, which is Byzantine work of the tenth century, is interesting.

Engineering Record (New York) has an article on "The effect of hydrated lime on Portland cement mortar," by Mr. Harry Gardner, Assistant Professor of Sanitary Engineering, University of Kansas, in which the author gives the results of his research and tests on the subject.

La Construction Moderne (Paris) illustrates the church of Sainte Barbe at Pont-de-Buis, Finistère, of which Mons. Chaussepied is the architect, and also a monument at Mar-

OBITUARY.

ON the 22nd of this month there passed away at "Glendower," Teddington, at the age of eighty-one, Mr. James Pigott Pritchett, architect, of Darlington. He was born in York on May 14, 1830, and was educated at St. Peter's School there. After serving his time with his father, the late J. P. Pritchett, of York (who practised on his own account in York for fifty-five years), he joined him in partnership in 1853, and in 1854 he succeeded to the practice in Darlington of his brother-in-law, the late John Middleton, who removed to Cheltenham. From 1854 to about 1910 he was engaged in an active general practice, though perhaps he was best known for his ecclesiastical work in the North of England. His son, Mr. H. D. Pritchett, was associated with him in the practice from about 1880, and in 1900 was taken into partnership, and is now carrying on the same. Mr. J. P. Pritchett's health became very bad about 1905, and he had to undergo a serious operation, after which he was never the same, and he gradually withdrew more and more from active work, leaving it principally to his son. In May of last year it was deemed advisable to send him south, and as he was needing a great deal of care and medical attention he was placed in the Nursing Home of "Glendower," Teddington, where he received every attention, and where he breathed his last without any pain, but being quite worn out. His works comprise seventeen cemeteries, chapels, &c., in various parts of the country, twenty-five new churches, twenty restorations and additions to churches, twenty-eight Nonconformist chapels, sixteen parsonages, eighteen schools and Sunday Schools, four banks, one large training college at Darlington, twelve offices, hotels and shops, restorations to two castles, over forty mansions, houses and cottages, and, in addition, sundry monuments, parish halls, &c., and houses on the Cleveland estate at Darlington. He was surveyor this estate under the late Duke of Cleveland, then unde the present Lord Barnard, and he and the firm are respo sible for a large amount of laying-out and development. H was connected with two or three archæological societies, an frequently lectured and gave papers on archæological subject His surviving family consists of two sons and three daughter one of the former and two of the latter being in New Zea land. He was for a good number of years a Fellow of th Royal Institute of British Architects, but resigned, an applied for and obtained re-admission in 1907. He had good deal to do with the establishment of the Norther Architectural Society.

Correspondence

[The Editor will not be responsible for the opinion expressed by Correspondents.]

The Land Taxes.

Sir,—So many cases of extraordinary low valuation a being brought to the notice of the Land Union that we thin it necessary to again draw the attention of owners, the solicitors, and agents to Section 2 (3) of the Finance Ac 1909-1910, by which owners of leaseholds, as well as fre holds, are entitled to make application (within three month after the original site value has been settled under the Act for a substituted higher site value as a protection again increment value duty, in all cases where the figures of provisional valuation disclose a site value less than the sit value at the date when the owner purchased it, if such pu chase was within twenty years of April 30, 1909, or durin his lifetime. Many holders of leaseholds are under the im pression that as they did not purchase and never were th owners of the site itself they cannot obtain a higher or substituted site value. This is not so. Anyone with a ta able interest in the land in question can apply for an obtain "substituted site value" within three months of th settlement of the "original site value."

A substituted (or increased) site value on quite a sma property which was brought to our notice recently has, o the application of the owner, been increased by about 50 pe cent. above the original site value fixed by the provisiona valuation. Inasmuch as the increment tax has to be ascer tained by comparing the value of the site when an occasio arises, with a substituted site value (if applied for and ob tained), owners will see the enormous importance of apply ing for and insisting on these substituted site values whic are to be based upon the prices they paid for their propert in better times, before threatened legislation and the subse quent depression caused by the land taxes.

In the case referred to, on a leasehold property value at about £700 only, the substituted (or increased) site valu was applied for and obtained, and it will probably save th owner about £25 increment duty, which otherwise he woul have been obliged to pay on realisation, even if he had sol at a loss.

Your readers will understand what this may mean in case where the value of the property runs into thousands o pounds.

The Land Union is dealing with the matter more ex haustively in a pamphlet now in the Press, which ca be shortly obtained on application to any branch of th Land Union, or to me at this address.—Yours truly,

C. H. Kenderdine.

Secretary, The Land Union, St. Stephen's
House, Westminster.

COMPETITION NEWS.

Skegness.—In the competition for a new cottage hospital for Skegness and District, the following plans have been placed by the assessor, Mr. Ernest R. Sutton, F.R.I.B.A:—1, F. J. Parkinson, Richmond Terrace, Blackburn; 2, Moore & Archibald, Albert Road, Middlesbrough; 3, J. Auty, A.R.I.B.A., Peel Street, Morley; 4, Barrowcliff & Allcock, Town Hall Chambers, Loughborough. Fifty-six sets of drawings were sent in response to the committee's invitation.

FORTHCOMING EVENTS.

Saturday, October 7.

Institution of Municipal Engineers : Joint Meeting of Yorkshire and Northern Districts at Leeds.

Northern Architectural Association : Visit to South Shields.

Monday, October 9.

Institute of Sanitary Engineers : Opening Sessional Meeting at Caxton Hall, Westminster.

Tuesday, October 10.

Guild of Architects' Assistants : Visit to New Polytechnic Building (Mr. G. A. Mitchell, A.R.I.B.A., architect).

Wednesday, October 11.

Manchester Society of Architects : Special Meeting; Exhibition of Drawings; Presidential Address by Mr. Edgar Wood, F.R.I.B.A., and Social Evening.

Thursday, October 12.

University College, London : First of a course of eight public lectures on "English Mediæval Architecture," by Mr. E. S. Prior, F.R.I.B.A.

Friday, October 13.

London Salon of Photography : Lantern Lecture, entitled, "With a Camera in Holland," by Mr. Arthur Marshall, A.R.I.B.A.

Glasgow Technical College Architectural Craftsmen's Society : Mr. J. S. Glen Primrose on "The Microscopical Examination of Architectural Materials."

MATERIALS OF THE PAINTER'S CRAFT.

If there were no other reason for a critical study and careful research into the nature of the materials that have been used by painters in the past, the durability that has been a striking characteristic is sufficient to raise such study and research from the level of antiquarianism and archæology to that of a practical science. Dr. Laurie, in his recently published book* on the subject, says: "The perfect freshness of a Van Eyck, as compared with the desperate condition of many a picture painted only a few years ago, is very difficult to understand, and at the end of all the light that modern science can throw upon the question we have to admit that the secret of Van Eyck has perished with him, and that he had a mastery of certain technical processes which has resulted in a durability of workmanship which to-day we cannot imitate."

Nor is the technical perfection of material peculiar to Van Eyck alone. We cannot feel proud of our modern skill in fresco painting when we contrast the fate of that at Westminster with the durability of the recently discovered frescoes of Knossos, dating back probably to about 1500 B.C. Even palæolithic artists have proved, as at Altamira, their ability to use effectively a palette limited to durable colours. In fact, one might almost say that as a general rule it is only within quite recent times that durability has been otherwise than general amongst the materials used in the painter's craft.

Dr. Laurie attributes the superiority in durability of the painting of Van Eyck and his contemporaries, his forerunners and his successors, to the fact that the artist of earlier times was also a craftsman. As an apprentice he learnt how to prepare the ground, whether panel, canvas, or wall, on which his master was to work. He also learnt how to prepare and even to make the pigments, to purify and grind them, and to mix them for use with suitable mediums and varnishes. Hence was built up a tradition in which what was faulty was rejected and only what was reliable retained. It was the painter's ambition not only to paint a beautiful picture, but one that by its permanence should be a credit to his craftsmanship. He therefore did not grudge the time, the labour or the patience required to attain his end, nor did he rely upon others as does the modern painter for his material.

The trade of the artists' colourman as a separate craft did not exist. Each artist was his own colourman, and his reputation was therefore as much at stake on the permanence of his productions as on their æsthetic quality. There is, besides, another consideration which we are too apt to forget when we recognise and admire the great works of the past in any art, in architecture as well as in painting. The artist-craftsman of the past doubtless made his experiments, and tried new materials, new processes and new combinations. The law of survival of the fittest has dealt with these. His successes have endured. His failures have vanished.

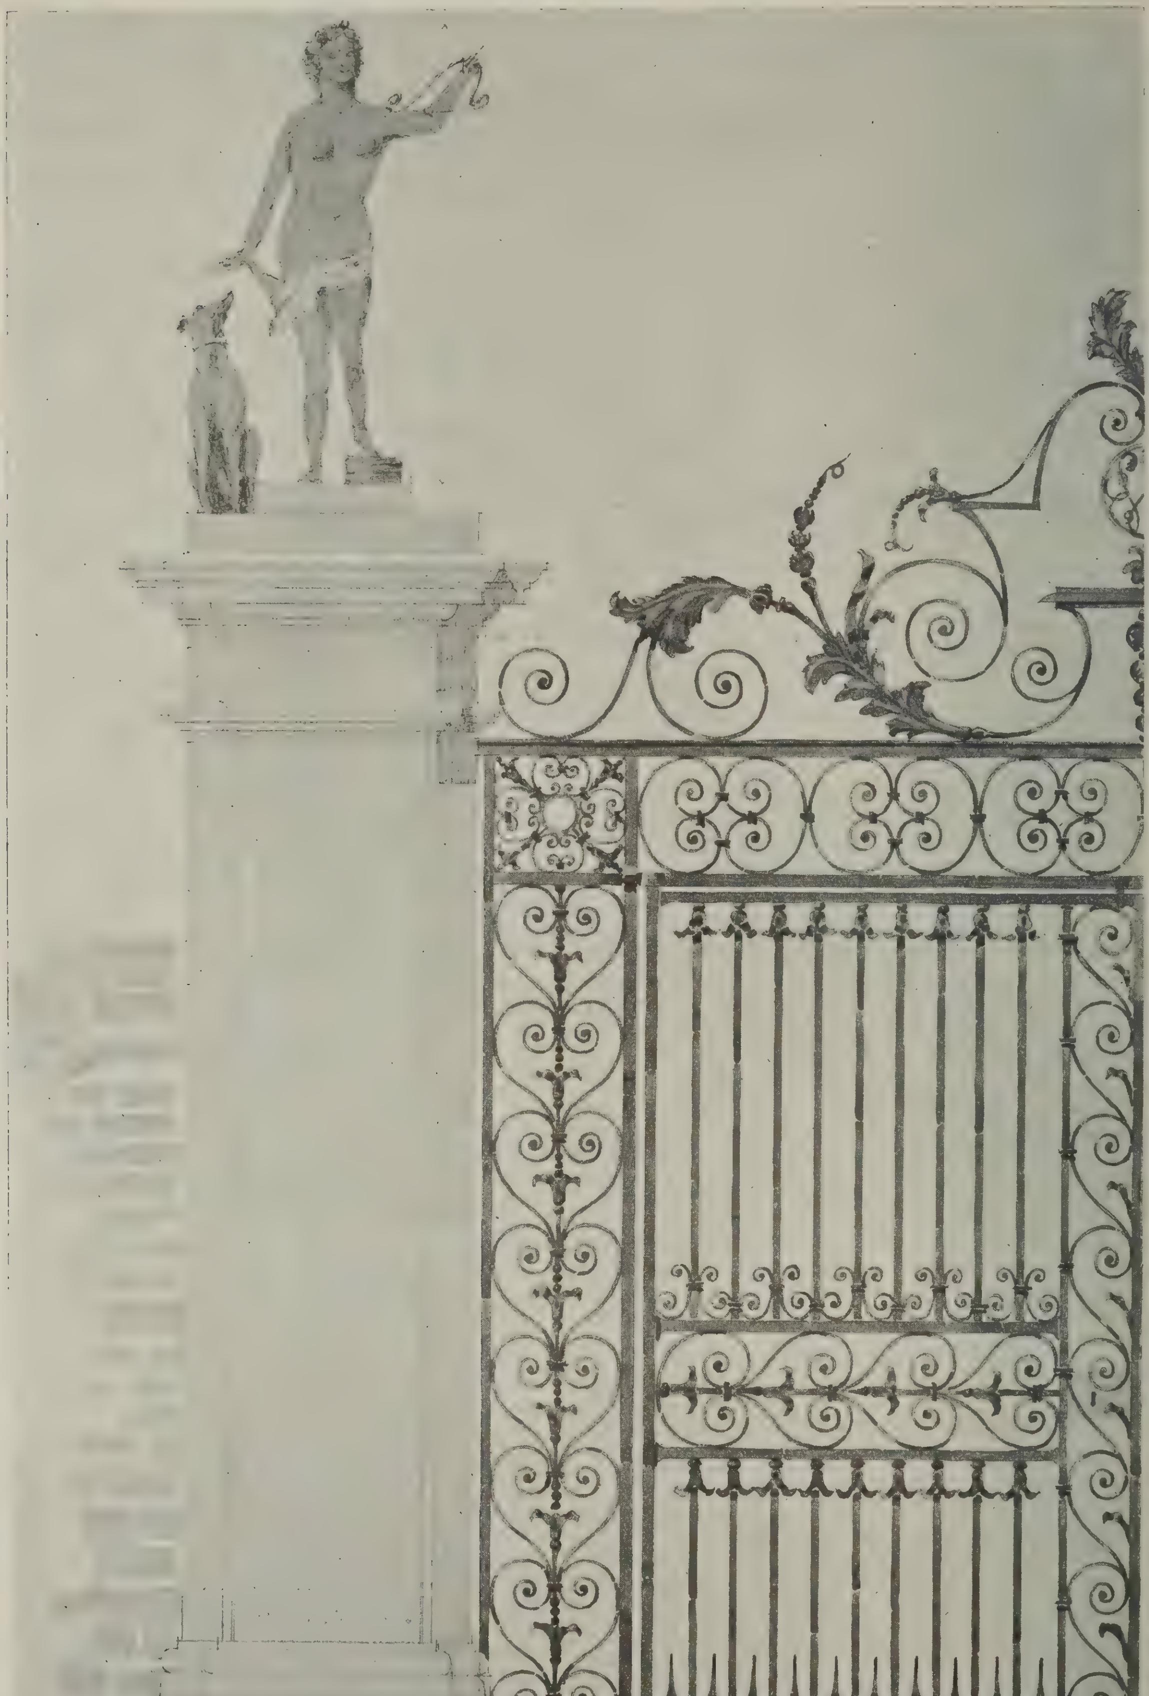
Whilst for the most part the teaching of master to apprentice was oral and traditional, there remain to us some few written collections of recipes and descriptions of materials and methods that throw light on much of the practice of the past, notwithstanding that the language being often colloquial rather than classical, difficulties of interpretation have tended to obscure the precise meaning of some of the information the writers desired to impart. From Vitruvius, Pliny, Theophrastus, and Dioscorides, but especially the two former, we learn something of the practice and processes of the Greeks and Romans. As in modern times there appear to have been two schools of painters, with different points of outlook corresponding to our Impressionists and Realists. So also there was a distinction in vehicle, one group of painters using beeswax, and others some medium of a different character, but of which there is no definite information to be obtained anywhere, we are told by Dr. Laurie. Our author is, however inclined to favour the view that an egg-medium was employed by the Greeks, just as it was in mediæval and fifteenth-century pictures, and that the reason why Pliny never mentions the medium is that it does not occur to him to refer to something so obvious, and which is a matter of common experience and practice.

From the writings of Cennino Cennini, early in the fifteenth century, Dr. Laurie quotes largely, and gives us much information as to the mediæval practice in fresco painting, to which something is added by Vasari in his introduction on technique to his *Lives of the Painters*. Knowledge of ancient pigments and mediums is obtained from Cennini and from the manuscript of a still earlier writer, the unknown monk Theophilus, whose *Diversarum Artium Schedula* contains sound advice as well as curious instruction, not only on painting of panels and illuminated manuscripts, but also on glass painting, and gives us a vivid picture of the artistic technique of the latter half of the eleventh century. From Cennini, too, we learn the

---

* *The Materials of the Painter's Craft in Europe and Egypt from Earliest Times to the End of the Seventeenth Century*, with some account of their preparation and use. By A. P. Laurie, M.A., D.Sc., formerly Fellow of King's College, Cambridge, Principal of the Heriot-Watt College, Edinburgh. Author of "Greek and Roman Methods of Painting." (London and Edinburgh: T. N. Foulis. 6*s.* net.)

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



WROUGHT-IRON GATES TO BERRYSTEAD HOUSE, OUNDLE, NORTHANTS.—Measured and Drawn by Mr. F. J. Lenton.

mediæval practice in gesso work and in gilding, in tempera fully, and, to a limited extent, in oil painting.

An interesting subject fully treated by Dr. Laurie is the preparation of the lakes used by the old masters. Many of the recipes given by the old manuscripts which he quotes he has himself tested. Our author then goes on to discuss the nature and history of varnishes, and the history of the oil medium, with special reference to the position of the brothers Van Eyck and the medium in which they painted. He especially points out the use of balsams, such as Venice turpentine, and comes to the conclusion that the older varnishes consisted of sandarac and pine resin, and later, mastic dissolved in linseed oil, the proportion of resin to oil being in many cases very high; that these thick varnishes were rubbed on hot with the hand; that amber varnish was also known, but must have been very dark in colour, and also varnishes in which the amber was dissolved in pine resin; that the use of oil of turpentine, spike oil, petroleum and alcohol in preparing varnishes is not mentioned till the sixteenth century, and it is only then that the use of pine balsams is frequently mentioned, and it is only at the beginning of the seventeenth century that recipes for preparing lake with, and dissolving verdigris in, pine balsam are given. Dr. Laurie's suggestion is that, notwithstanding the absence of confirmatory documentary evidence, the medium used by Van Eyck and his immediate followers was a balsam with a little admixture of oil. By experiment he has demonstrated the preservative value of such a medium for colours otherwise fugitive. To overcome the stickiness of the resinous medium it is suggested that it was emulsified with white of egg, and, further, that the earlier part of the picture might be painted with pure egg, or tempera, the emulsified medium used above this, and, possibly, finished with pure varnish.

The author concludes his careful and interesting analysis of the materials used by painters in the past with a prescription based on ancient practice and modern experiment for the painting of a picture which would last for ever.

WROUGHT-IRON GATES TO BERRYSTEAD HOUSE.

THESE gates and lead figures date from the seventeenth century. They were moved to their present position from Stoke Doyle Manor early in the nineteenth century. The piers probably were built then as they are not original, but may be copies of their predecessors. The lead figure represents Diana, and there is another on the opposite pier representing Apollo with his harp. They are both in excellent preservation. The gates are now very much damaged, most of the leaves being missing, but enough remains to effect the restoration shown.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE have received a fair number of drawings for the subject set for September—a porch or portico to an ecclesiastical building erected in England or Scotland prior to A.D. 1800. It is remarkable that a considerable proportion of these show Norman work, and whilst we would not go so far as to suggest the entire avoidance of the study of this period, it is not one on which the student should be encouraged to spend much time in preference to later and more fully developed forms of mediæval architecture. Just as in the study of Renaissance work, the productions of Elizabethan and Jacobean are best left alone by the young student, so Norman work should not be preferred to that of the thirteenth and early fourteenth centuries.

"Doric" has very carefully measured and drawn the north porch of Bridlington Priory Church, an excellent specimen of Early English work, with capital mouldings and carving. The drawings are executed in pencil, to half-inch scale, with details one-third full size.

"Avec beaucoup de Peur" sends a complete set of measured drawings of the north porch of Wells Cathedral, drawn to half-inch scale, with details full size and one-quarter full size. Whilst it is wise to use a wash of colour to fix the pencil work, our contributor should avoid endeavouring to impart a false prettiness by using fanciful tints. In measured drawings, the aim should be to make them workmanlike, and not pretty pictures.

"Alpha" also uses colour of rather too pretty tones in his drawings of the south porch of the chancel to St. Andrew's Church, Newcastle-upon-Tyne, a simple and unpretentious little structure, of which the chief interest lies in its roof of stone slabs, carried on three transverse arches. The general drawings are to quarter-inch scale, which is rather small for anything worth careful study; details half full size are a mistake, they should be either full size or not more than one-third full size to avoid misunderstanding. "Alpha" is on the right lines with his technique of water-colour and pencil drawing, but wants more practice.

"Seleth" has measured a porch added in 1503 to a church of about 1150, the Norman doorway of which is included in the drawings. Although so late in date, the carving shows Celtic tradition in the ornament. The general drawings are to half-inch scale, with details one-quarter full size, and are wisely given permanence by inking in and monotint. If a thing is worth measuring, the drawing should be worth keeping.

Mr. E. H. Gibson sends a sheet of drawings to the large scale of inch and a half to the foot of the porch of Askham Bryan Church, Yorkshire, which has a good Late Norman doorway showing signs of the Transitional period. Although to a large scale, Mr. Gibson's drawing would be better for some details to a still larger size.

"Jock" has selected for his subject the south porch of St. Michael's Church, Linlithgow, and has drawn same to half-inch scale, with one-quarter full size details of mouldings. These latter do not give us the impression of being quite accurate. "Jock" should avoid in measured drawings the use of occasional thick lines and solid black shadows, with the idea of getting sparkle. As we have said above, measured drawings should be workmanlike, and not pretty.

"Caer Ebrauc" contributes a well-executed drawing of the porch of Skelton Church, Yorkshire, drawn to half-inch scale, with details of mouldings, some one-sixth, and others one-half full size, neither of which scales is desirable, the former being too small, and the latter misleading. A better idea of the architectural relation of arch mould and jamb is obtained by drawing them one over the other in different colours, but to do this effectively and clearly, the scale must be larger than one-sixth full size for mouldings so intricate as in this case. It is a pity our contributor did not draw these mouldings full size; they are well worth it, being full of subtlety and skill.

We have decided to award this month a prize of one guinea each to "Doric" and "Avec beaucoup de Peur."

NOTES AND COMMENTS.

The National Trust has been blamed for not seizing the opportunity of purchasing Tattershall Castle for £2,000, less a donation of £100 from the proposed vendor, Mr. Albert Ball, but from the statement of Sir Francis Trippel to the *Times*, it is quite clear that the Executive Committee of the Trust were acting wisely in refusing to be made catspaws in a regular "old-master" transaction.

From Sir Francis Trippel's statement we learn that Mr. Hooley in the early part of last year had contracted to purchase from Earl Fortescue the Tattershall estate of 4,749 acres, and had agreed to sell the Castle, including chimney-pieces, to Mr. Ball for £1,125. Mr. Ball never completed his purchase, but, failing to get £2,000 for it from the National Trust, or even £1,500, cash down, agreed to the cancellation of his contract to buy. Very kind of him! We suppose he did not know where to look for another customer from whom he could get fifty per cent. profit on his unpaid-for purchase.

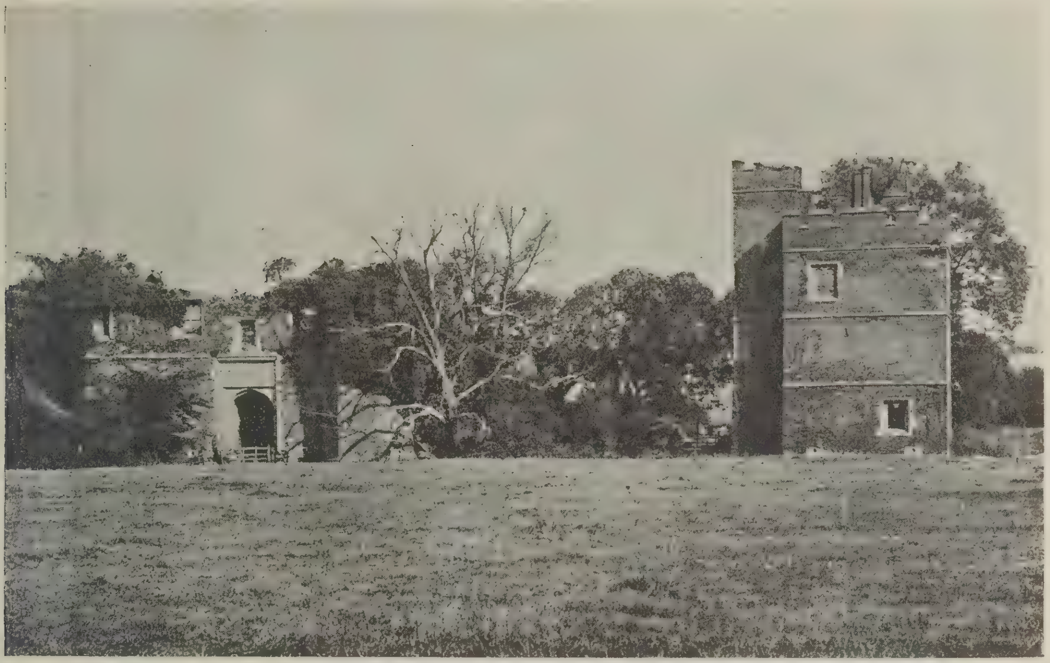
Then an "unknown American" buys the Castle for £2,250 and refuses Sir Francis Trippel's offer of £2,500, cash down, but is willing to accept £10,000, the sort of bargain that speculators in "old masters" are wont to make. Next day the price is reduced to £7,500, but Sir Francis did not snap the bargain. The next stage seems to have been the sale of the mantelpieces at a satisfactory price, and the Castle, without the mantelpieces, is offered to the National Trust for £2,000, but the deal has not come off and is not likely to do so. As Sir Robert Hunter truly said in his letter to the *Times*, "a body like the Trust has a double duty to the public—to lose no opportunity of putting such buildings beyond danger of destruction, and at the same time to avoid raising their price by ill-considered appeals for their purchase."

In our view the Trust has deserved the respect and confidence of the public for declining to make use of Sir Francis Trippel's offer of a loan of £5,000, which, with their assistance, might have been extracted from the pockets of a generous public and transferred to the owners of a property whose market value, before the "old-master" game was initiated, was £1,125. It is high time that statutory protection of our ancient monuments from the "old-master" market was provided, and if the unsavoury history of Tattershall Castle hastens that provision we need not regret the loss of the mantelpieces.

The news that the Society of Antiquaries has been able to make satisfactory arrangements with the owner, Lord Barnard, for commencing the excavation next spring of Uriconium or Wroxeter is very satisfactory and awakens hopes of important discoveries. At the annual meeting of the Shropshire Archæological Society, Mr. C. R. Peers, Secretary of the Society of Antiquaries and Government Inspector of Ancient Monuments, said in the last twenty-three or twenty-four years the Society had thoroughly investigated the whole site of the Roman city of Silchester, and at present they were engaged in investigating the site of Old Sarum. Now they proposed to come to Shrewsbury and undertake the excavations at Wroxeter, which was a far more important area than any they had undertaken—than any, he thought he might say, which had been undertaken in Britain, because they must remember that Silchester was a comparatively small country town, and probably at no time could boast any great architectural splendour or wealth. Wroxeter, on the other hand, was nearly twice as big; it had no written history, but it must have been of very considerable importance. It was destroyed all at once in 584 or somewhere about the end of the sixth century, and probably what was there then was to a large extent there still. No serious excavation—with the exception of that very good work done on the basilica and the bath in 1861—had been done at Wroxeter, and the city might not have been disturbed since 600. At any rate, the fact remained that it was a magnificent field. This was the most important piece of systematic Roman excavation ever done in Britain, and it was worth their while to do everything they could to make it a success at the beginning. If it started well, and there were valuable finds, he had no doubt sufficient income would be assured.

The erection of roods or screens has usually been unfavourably regarded by Consistory Courts, and the judgment of Chancellor Prescott at the Carlisle Consistory Court on an application for a faculty to erect a rood in Urswick Church fairly sets out the view that is commonly taken. The Chancellor, in giving judgment, said: This is the first time, so far as I am aware, that application has been made to this Court to erect a so-called rood in a parish church of this diocese; and the particular point on which emphasis has been laid is that it is not liable now in the views of the parishioners to "superstitious reverence." I therefore think it is necessary to make some remark on the subject. This matter was argued and elaborate judgments given in the Arches Court and by the Lord Chancellor and the Court of Appeal in the case of Ridsdale *v.* Clifton. I am not going to quote those judgments in full, but will only refer to one point. It is important to note that this judgment was given after the case of Phillpotts *v.* Boyd, when the erection of the Exeter reredos, which contained sculptured images, was allowed on the ground that it was for the purpose of decoration only and not in danger of being abused, nor was any superstitious reverence likely to be paid to any of the figures on it. Notwithstanding this, their Lordships refused to grant a faculty for a crucifix placed on a screen separating the chancel from the church. They concurred in these words of the learned Judge in the Court below:—"It is no doubt easy to say, what proof is there of danger of idolatry now? What facts are there to point to a probability of abuse? But when the Court is dealing with a well-known sacred object—an object enjoined and put up by authority in all the churches of England before the Reformation, in a particular part of the church and for the particular purpose of adoration, when the Court finds that the same object, both in the Church and out of it, is still worshipped by those who adhere to the unreformed Romish faith, and when it is told that now, after a lapse of three hundred years, it is suddenly proposed to set up again the same object, in the same part of the church, as an architectural ornament only, it is hard not to distrust the uses to which it may come to be put, or escape the apprehension that what begins in decoration may end in idolatry. If this apprehension is a just and reasonable one, then there existed that likelihood and danger of 'superstitious reverence.' Is it really so absurd to imagine that in the present day the worship of lifeless images and figures, not as idols, perhaps, but as aids to devotion, should again prevail as in old times? What I am here discussing, I must again repeat, is not the belief in an idol of wood and stone, but the practice of involving in devotional exercises outward and visible forms as inculcated in the devotional books of the Roman Catholic creed." So much for the learned Judge. It may, I think, be assumed that the danger, if any, has not diminished during the years since that judgment was pronounced. In mediæval days, the chancel screen was the distinct division between the clergy and the worshippers. This division has now been done away with, and the people now look to the East end and the Holy Table for sacred emblems rather than the top of the chancel screen. I think that is the argument against putting any of these emblems in that position. Often when objects are brought before this Court which are illegal, or which sail very near the wind, I am told that they are gifts. I know the difficulty in which the incumbent and the parishioners are often put when gifts are offered by those who have been benefactors in other respects, and it is well that there is a Court to which an appeal can be made. I am quite aware, whatever may be the case with regard to the parishioners of Urswick, that there are parishioners in many parish churches who would consider the putting up of such objects as appear in these plans to be most offensive, and would in some cases drive them away from their parish church. I have, therefore, come to the conclusion that the faculty for putting up this rood beam and these figures cannot be granted and will not be granted.

The managers of the Sheffield Technical School of Art appear to have come to a wise decision in their proposal to arrange at the school classes dealing with decorative design, with instruction in architecture of a kind essential for all students other than architects—that is, in style, proportion, and moulding, which classes they considered would "meet a pressing need in connection with the advanced curriculum of the school without in any way trenching upon the work carried on at the University." The general instruction of the educated public in architecture to the extent of comprehension of its meaning, its purpose, and its achievements, is highly desirable, but the extent of this instruction falls far short of that necessary for the professional architect. Some intelligent appreciation of architecture is necessary for a liberal education,



KIRBY CASTLE.—VIEW FROM THE FRONT.

and this can be very well imparted by schools of art and polytechnics, but the adequate training of architects is beyond the powers of such institutions.

An extraordinary general meeting of the Manchester Royal Exchange, Ltd., has resolved: "That the directors are hereby requested to proceed with the elaboration of a scheme for the extension of the Royal Exchange on the side of Bank Street, at an estimated cost of £500,000, and with that object to prepare a Bill to be promoted in Parliament in the session of 1912." Thus the subscribers have determined not to fall in with the views of some members of the Corporation, who wished the Exchange removed to the old Infirmary site at Piccadilly.

BRICK-BUILT CASTLES OF LEICESTERSHIRE.

KIRBY CASTLE.

According to Throsby the historian, Kirby Castle was built by William Hastings, a descendant of Sir Ralph Hastings. Members of the Hastings family filled prominent positions in our history from very early times after the Conquest. At a Parliament held at Nottingham permission was given by Edward IV. to Lord Hastings to build the castle and enclose and empark 2,000 acres of land and wood with the appurtenance of their demesne lands, there and elsewhere in the county of Leicester.

This castle is one of the first fortified buildings in the county of brick, and in its time must have been a very handsome structure. It was not completed to Lord Hastings' plans, his sudden and tragic death a few years later preventing this. Lord Hastings was beheaded in 1483 by order of Richard Duke of Gloucester, owing to his fidelity to the claim and right of the sons of Edward IV. to the throne, and because he would not further Richard's treacherous designs. Lord Hastings by his will devised the manor and park of Kirby to his wife, Katharine, and also directed one thousand priests to have sixpence each to say a thousand Placebos and Diriges, and a thousand masses for his soul.

Jane Shore lived for a time here, having left her husband for the king, and after his death the Lord Chamberlain took her back to London, where she remained for the rest of her life.

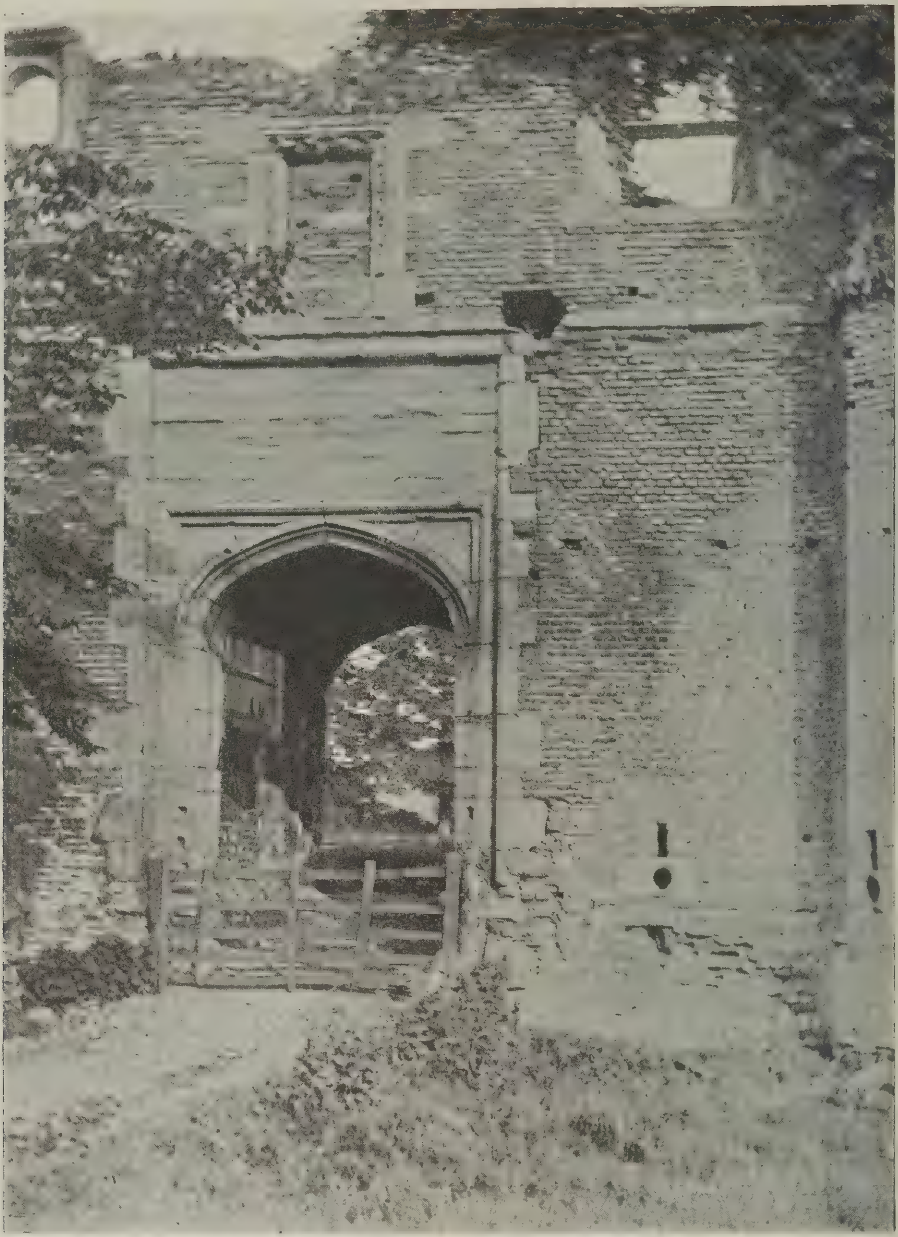
The remains of this castle are brick cemented with strong lime mortar (some of which remains undecayed, where the bricks have entirely perished). The gateways, front and back, doorways and window frames are of a fine, soft, but durable white limestone, procured from the Dane Hills, about two miles distant from the castle.

Two noble towers remain tolerably perfect in spite of wind and weather; one on each side of the principal entrance, which is under an obtuse arch, composed of massive voussoirs with their joints going right through to the brickwork. The mouldings are clear cut, with sharp arrisses, dying away upon the outer face. Within the gateway, under the outermost arch, there is an open space or perforation up the wall, probably to admit the descent of a portcullis. This entrance was secured formerly by two pairs of double gates—one pair external and one pair internal; the hooks upon which they turned are nearly 10 inches in circumference. There is only one pair of gates left, and they are in a very broken condition; the framework only remaining, revealing large bolts and framing three inches thick. One man's whole strength is required to move one of these crude and ponderous gates, the weight of which must have been enormous at the time when the castle was inhabited and the gates had their full number of iron bars and struts.

The entrance hall is not very large, but is impressive notwithstanding, with smaller doorways on each side which admitted the men-at-arms to their quarters; these apartments were surrounded by loop-holes where men were no doubt stationed to keep watch and to discharge their arrows. These loopholes widen internally the whole thickness of the wall, and are bordered with the aforementioned white stone; some of the circular ones are very near the edge of the water in the moat, so that, in the case of anyone trying to swim the same he would soon be seen and transfixed by an arrow from one of the watchers.

The guard-rooms, of which there are two, one on each side of the gateway, are about 15 feet high and roofed with a waggon vault in solid brickwork. From both the guard-rooms there is a very low arched doorway to each tower, and from there another door even lower than the last, with a flight of steps to the dungeons, which are small square chambers about five feet square, lighted by narrow slits in the brickwork. The walls are five feet thick, of solid brickwork, with a hole in each to the moat; this being the only method of getting rid of refuse and sewage matter. No vestige of plaster or wall coverings is perceptible, but bare walls and floor of brick, and vaulted ceilings of the same material, eight feet high. Each tower contains dungeons, with a guard chamber allotted to each. Arches are used everywhere; even below the ground the builders preferred to make the foundations more than four times the thickness of the wall in brickwork, with arches at intervals of every two feet rather than employ concrete to distribute the weight.

On returning from the dungeons to the guard-room and back to the entrance hall, the ceiling of which has crumbled away, the visitor can view from the ground floor the banqueting hall above him, to which access may be gained by mounting one of the spiral staircases at the back of the castle. The photograph shows the entrance to one of these staircases; the arched doorway is constructed in stone with the same type of arch and mouldings as the main or entrance



KIRBY CASTLE.—MAIN GATEWAY.

gateway. The smaller doorways are not in such good preservation as the main gateway, owing to the wind and weather being fiercer and stronger on the back than the front. It will be observed from the photograph that there is an arched recess under the stairs which might have been used as a store of some kind. The stairs are much worn and very dark owing to the insufficient light through the small windows, which are about six inches wide and set in very deep reveals.

There are no stone dressings or sills to the smaller windows, nor is it probable that glass was used, as there is no indication or indentation for bars or supports. The brickwork over the stairway was constructed with neatness and skill, and with good regard for bonding, each brick being cut to form the winding or corkscrew form, which winds round and round until the top is reached.

After ascending about fifteen feet of stairs the entrance to the banqueting hall is reached; the brickwork here shows signs of better workmanship than the exterior, having thinner joints and bricks of finer texture, with less burrs and lumps in them. All the bricks at that time were hand-made and were longer and thinner than the bricks in use to-day. The hall had two fireplaces, one at each end, spanned by elliptical arches of six feet span. The flues do not decrease in length and breadth till the battlements are reached, where they terminate in octagonal chimneys of slender proportions. There is no doubt that the hall was vaulted by a segmental or waggon vault. Vestiges of plaster still exist about one inch in thickness, made of very coarse material. The floor was of brick, most likely strewed with straw or reeds from the moat, to take away the cold damp look which is always perceptible or felt on a plain brick floor.

There are four entrances to the hall, all spanned by somewhat low arches, two of which lead to the towers, where guards were placed to keep watch. On entering one of these towers there is another doorway facing you, with a flight of four steps terminating in a landing. After ascending these the sleeping apartments are to be seen, but there is no sufficient evidence of their number. The doors were very heavy, as the hooks upon which they swung were made of stout iron, bedded into the stone dressings and run or caulked with lead.

The isolated tower at the west angle formerly consisted of three storeys, surrounded by a flat roof and embattled parapet, with two square towers.

The courtyard was not altogether paved, but the earth was rammed to a hard surface, except to the left tower, where stables and outhouses existed; there brick paving or remains of such can be seen.

Signs of scalding lead are to be seen on the walls, so that possibly some fighting took place there. The walls are ornamented with blue brick diaper work, in crosses, and an effect of solidity is given to the structure by a deep plinth course of stone running round the whole.

There is an underground passage from the castle to St. Bartholomew's Church, which has been bricked up owing to the falling of some masonry and brickwork, thereby entombing two youths who were exploring it. Only one cottage stood when the castle was built, and this is still in good preservation and inhabited.

KIRBY CASTLE.-VIEW FROM BACK.

STAINED-GLASS WINDOW BY MR. R. ANNING BELL.

MR. ROBERT ANNING BELL, R.W.S., is a man of many parts. According to "Who's Who," he is a painter, modeller, designer of stained glass and other decorative work, an occasional contributor to the leading periodicals, and a well-known illustrator of books. A few weeks ago he was appointed Professor of Design and Decorative Art at he Glasgow School of Art.

An opportunity of seeing an interesting example of Mr. Bell's skill in stained glass was afforded us this week at the studio of Mr. A. J. Dix in Gower Street, W. Here was displayed a three-light memorial window to be erected at Abbotsbury Church, Dorset, by the widow of the fifth Earl of Ilchester. The lighting conditions were obviously quite unfair to a work of the kind, and the effect will no doubt be coniderably enhanced when seen *in situ*. Each light is 16 inches wide by 5 feet 6 inches high, and is principally filled by a ingle figure of a saint. The saints are St. Nicholas, St. Catherine, and St. Andrew. One noticeable feature is he absence of architectural accessories as a background. As might be expected, the colouring is conspicuous for its richness. It has been said by some that Mr. Anning Bell is too generous with his colour for stained glass. In this case a pirit of restraint is manifest, although there is only a very mall amount of plain surface. White glass (so-called) is introduced fairly freely to mark the break from one colour to another. It is along each narrow border and above and below the figures that the artist has exercised an almost playful fancy by the introduction of a multiplicity of small pieces each of different broken design, and generally showing a symbol connected with the saint. The possibility of conusion is prevented by the insertion of occasional small pieces of coloured glass without any pattern. The effect is extremely rich, without in any way interfering with the arge figures. Another charming feature is the cherubs supporting the label above each saint.

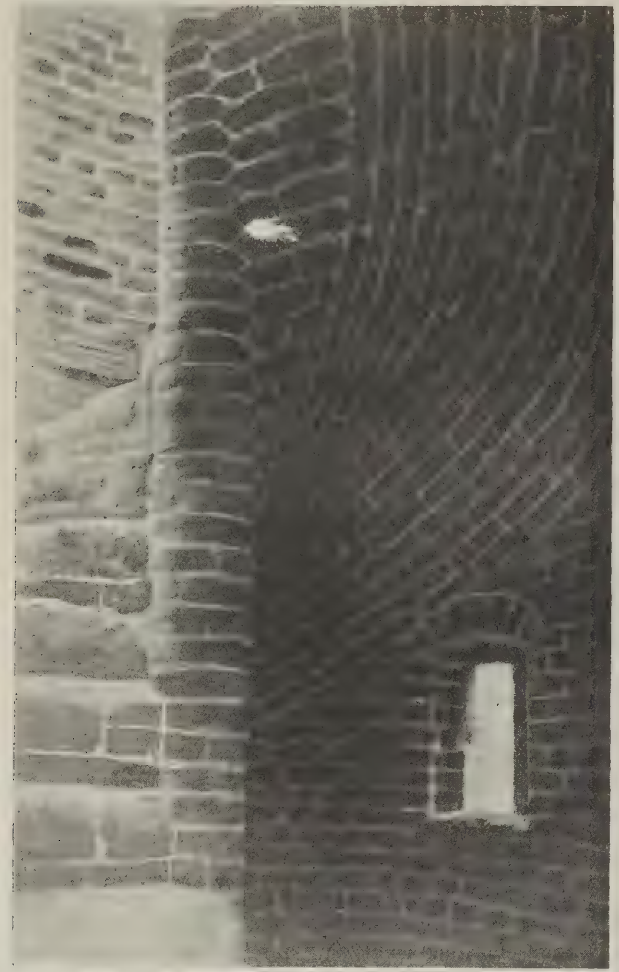
The window head will be filled in by a number of maller pieces showing cherubs' heads and conventional designs.

OLD MASTERS AT THE GRAFTON GALLERIES

IT may seem superfluous to commend, even more to introduce, the National Art-Collections Fund to anyone connected with art in any of its forms. Ever since 1903, when it was founded, this Society has constantly proved its enormous usefulness and consistently demonstrated its worth. Its object is to secure pictures and other works of art for the national collections in London and the provinces, in the same way as has been for many years done or France and Germany by the Société des Amis du Louvre and the Kaiser Friedrich-Museums-Verein. Although the annual subscription is no more than a guinea, the membership is so far only between twelve and thirteen hundred, or less than one-half that of the French society. The resulting income would by itself obviously be of tantalisingly small use in competition with the purses of millionaires and other wealthy public or private buyers. Fortunately the Fund has some very good friends who dip their hands deeply and quickly into their pockets when special appeals for contributions are made for the acquisition of objects of unusual importance when such come into the market. It may easily be understood that owners of important works who are about to part with their possessions often offer them in the first instance to the Fund for the Nation at prices lower than they would accept from any other purchasers. Too often these offers have to be declined through lack of ready money. Nevertheless, in its eight years of activity, the Fund can point to such triumphs as the purchase of the "Rokeby" Venus, by Velasquez, and Holbein's "Duchess of Milan"; a "Nocturne in Blue and Silver," by Whistler, as well as many other examples of modern work. The scope of such a fund must necessarily be almost boundless, more especially in a country like ours where the money at the disposal of the national museums is quite inadequate for successful competition with foreign rivals.

A most excellent method of putting money into the deserving coffers of the Fund was inaugurated last year when an exhibition of Old Masters was held at the Grafton Galleries, Grafton Street, W. The success was immediate. This year a similar exhibition-in-aid has been arranged. Though it can scarcely create the stir which was made by its predecessor, the exhibition is none the less of very high value and certainly deserving of a visit on its own merit quite apart from the worthiness of the cause. The Galleries are in themselves a worthy setting to any gathering of pictures. For the present occasion the hanging has been carried out by Mr. Roger Fry, the secretary. There is in each of the rooms, with the single exception of the End Gallery, a splendid feeling of spaciousness due both to the size of the apartments and to the well-balanced arrangement of the exhibits. One comment may perhaps be permitted concerning the arrangement of the Large Gallery. Here we find, side by side, pictures by Gainsborough, Guardi, Nicholas Poussin, and Romney; Watts, Titian, Tintoretto, Reynolds, XVI. Century Italian School, Romney, XVII. Century Italian School, Rembrandt, and Goya, while the other part of the room is occupied by works of the Venetian and Florentine schools. The curious medley comes as a surprise after the careful grouping of most of the other pictures.

The present exhibition is so catholic in its selection that it is by no means easy to know what works to mention and what to omit. It must certainly contain something for every taste to admire between the two small wood panels by Duccio di Buoninsegna (1255-1319), and the magnificent example of Watts painted in 1857. The Octagonal



KIRBY CASTLE.—CIRCULAR BRICK STAIR.

Gallery is the first entered, and its interest will keep the visitor for some time. It includes two fine and curiously similar representations of the Madonna and Child, one ascribed to Massaccio and the other by Benozzo Gozzoli, both of fifteenth century Florentine school. How different is the "St. Michael overcoming Satan, with the figure of a kneeling donor," by a Spanish painter of the same century called Bartolommeo Vermejo, whose name has only within the past few years been brought out of obscurity! Here the painter allowed himself full liberty in his colour and action. The detail and the vigour are amazing for so large a work. The "Madonna and Child," by Mantegna, has been described as perhaps the freshest and most charming, as well as the earliest of all his existing works. It is wonderful to think that the delicate polyptych by Bernardo Daddi, dealing with the "Crucifixion," could have been painted nearly six hundred years ago. Its pale flat tints are in extraordinary preservation.

In the next room is a delightful "Holy Family," by Fra Bartolommeo, which is pervaded by a spirit of reverent tenderness, most particularly in the dignified figure of the aged St. Joseph, who sits gazing with loving solicitude on the Infant Christ in Mary's lap as He gives a small red cross to the Infant St. John. Altogether different is the "Portrait of a Lady as Mary Magdalene," which depicts a fascinating lady of Milan of about 1500. It seems curious to skip three and a half centuries in order to next refer to the masterpiece by George F. Watts entitled "Portrait of Mrs. George Cavendish Bentinck and her three children." The life-size figures are grouped with happy skill, and the whole group suggests perfect English motherhood and childhood. Strikingly different is the arrangement adopted by Romney for "The Bosanquet Family," in which the four figures fill a straight line from side to side of the picture. There is all the customary refinement and distinction in Sir Joshua Reynolds's portrait of "Mrs. Bouverie and Mrs. Crewe." Rembrandt is credited with more pictures in this collection than any one other artist, the total number being five. A typical portrait is that supposed to show his father.

There are only two works by Rubens, one a landscape, and the other is of doubtful authorship; the latter shows a forcible portrait of a young ecclesiastic.

ARCHITECTURAL ASSOCIATION ANNUAL EXCURSION.

We give this week illustrations from photographs taken during the visit of the Architectural Association to Loches and the Château du Moulin.

SOUTHWARK FREE LIBRARY.

This branch library which stands upon a site at the corner of Old and New Kent Roads, presented to the borough of Southwark by Lord Llangattock and his son, was erected by Messrs. F. & H. F. Higgs from the designs and under the supervision of Mr. Claude Batley, A.R.I.B.A. The design is substantially that which was placed first in the open competition assessed by Mr. A. W. S. Cross, F.R.I.B.A.; the tower and mosaic panels, however, were the outcome of subsequent modifications desired by the Borough Council. The ground floor is devoted to the general reading public, and the first floor to the loan and reference departments. An endeavour has been made to reflect in the building itself the history of the district, which is very rich in incident. The style chosen lends itself very readily to this purpose. Thus the Viking ship weather-vane is in allusion to the siege of London by Cnut when he brought ships up a canal dug in a crescent skirting the south side of Old London Bridge; the staircase bay window is filled with leaded lights commemorating the Chaucer Pilgrims on their way to Canterbury, while the mosaic panels below depict, the one, their start, and the other the feast given to the pilgrim who was judged to have told the best tale; these panels, which, although not suggested in the original design, certainly lend an interesting touch of colour to a corner strikingly lacking in that or any other interest whatever, were designed and executed by Mr. Thomas A. Cook before the erection of the building. Other leaded windows mark the connection of Sir John Fastolf, Gower, Goldsmith, Dickens, Eliza Cook, Coventry Patmore, Ruskin, Harvard, and Mr. Andrew Carnegie (the donor of the library) with the borough, while the Llangattock and Borough arms afford motifs for some of the carvings and, internally, for the moulded plaster cornices, &c. The whole of the joinery, fittings and furnishings were designed specially and executed by the general contractors. The oak is left oiled. On the screens are carved the names of some famous men who in some way or other have come into touch with the borough. Many other references to local interest are embodied in the design. The staircase, balustrade, electric light fittings and other metal work were executed by Messrs. George Wragge, Ltd.

THE ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Association was held at 18 Tufton Street, Westminster, S.W., on Monday, October 2, Mr. Gerald C. Horsley, F.R.I.B.A., President, in the chair. Round the walls was hung an exhibition of students' work, prize and other drawings.

Mr. Herbert A. Hall, Hon. Secretary, read the names of thirty-six candidates nominated for membership. The President announced the election of Mr. W. L. Clark and Mr. W. A. Whitewright, and the reinstatement of Messrs. A. MacConnell, M. J. Dawson, V. S. Whitaker, and W. S. George. Notice was given of a vacancy on the Council caused by the resignation of Mr. P. W. Lovell, B.A.; the Council will, at the next meeting, suggest a candidate, and under by-law 37 any member may nominate any other candidate.

Prize List.

Mr. Gerald C. Horsley then distributed the prizes and medals gained during session 1910-11 by the following students:—Mr. G. W. Home, A.A. silver medal; Mr. C. F. Butt, Architectural Union Company's prize; Mr. V. J. Durnford, Banister Fletcher Bursar, 1909; Mr. T. F. H. White, Banister Fletcher Bursary and drainage and water supply; Mr. A. G. Shoosmith, Class of Design prize; Mr. H. J. H. Dicksee, history, construction, geometry, physics, and studio prize, first year; Mr. E. C. Davies, freehand drawing, first year; Mr. D. J. Gordon, travelling studentship, second year—end of session test, second year, prize offered by H. P. G. Maule; Mr. E. Kennedy Smith, scholarship, preparatory courses; Mr. J. B. M. Walch, preparatory course, geometry, and European mediæval architecture; Mr. J. A. Hale, master's prize, preparatory course; Mr. A. B. L. Roberts, scholarship, third year; Mr. G. W. Stuart, book prize, third year; Mr. T. F. Ford, master's prize, third year; Mr. H. V. C. Curtis, travelling studentship, fourth year, and master's prize, fourth year; Mr. F. A. Crouch, fourth year book prize; Mr. C. W. Marles, preparatory physics; Mr. C. J. McCausland, preparatory physics; Mr. A. B. Peermahomed, intermediate physics; Mr. G. Fildes, Renaissance architecture, Greek and Roman; Mr. P. H. Bagenal, English architecture; Mr. C. M. Cooper, advanced physics; Mr. G. A. Fortescue, ventilation, lighting and heating, and professional practice; Mr. H. Gresswell, materials.

The following students have been recommended by the External Examiner, Mr. Paul Waterhouse, for the Board of Architectural Education Certificate, which entitles them to exemption from the R.I.B.A. intermediate examination:—Messrs. A. S. G. Butler, F. A. Crouch, G. A. Fortescue, B. P. Gaymer, J. O. B. Hitch, L. D. Martyn, and C. W. Rogers.

The following students have been awarded the Association Two-Years' Course Certificate:—Messrs. H. D. Archer, S. A. Bennett, D. E. Cruickshank, F. G. Detmold, T. W. Dowsett, G. Fildes, D. J. Gordon, W. Harkess, E. J. T. Lutyens, and A. B. Peermahomed.

Mr. Gerald C. Horsley then delivered

The President's Address.

Fellow Members of the Architectural Association,—Before I begin what I may call the more serious part of my address, I would like first of all, as your President for this session, to have a word with you about our Association. The Architectural Association has already travelled far upon the road towards fulfilment of the ideal of its founders. I like to think that that ideal was to inspire in its members a true love of art, rather than a mere desire to be successful business men. This was the aim of a band of young architects, the founders of our Association sixty-four years ago.

As the first President of our Society, the late Professor Robert Kerr, said a few years ago, when speaking of its origin, and the conditions of architectural training at that time, "the time had come for a stirring of dry bones. It was not the seniors, but the juniors themselves who made the demand—that there should be supplied to the inquisitiveness of youth something more up-to-date than all this" (referring to the architectural training of that time). "Why not take the matter in hand for themselves? said young Charles Gray and others. Why not, indeed? said Donaldson and Godwin. So they did it; and the upshot of it has been that, not in London alone, but in other centres of English energy, it has become a first principle in our professional training that the young men shall put their own shoulders to the wheel as an organised body. And well, thoroughly well, has it answered."

So will it ever be. Enthusiasm is with the young.

Here are a few figures in proof of the steady growth of the Association. The present number of members is 1,611. This time last year it was 1,589. Thirty-five years ago it was 668, showing a growth since that time of about 1,000.

The number of students also in the classes from the foundation in 1847 up to some ten years ago, when the schools were placed upon their present basis, was a varying number in proportion to the number of members at the time.

Since 1901, when the present schools were formed, the number of students who have passed through them is about 1,500.

These numbers surely speak well of the work done in furthering the aim and ideal of our Society.

The "Brown Book" states the objects of the Association to be as follows:—"To promote and afford facilities for the study of architecture, and to serve as a medium of friendly communication between the members and others interested in the progress of architecture." It goes on to say that the objects shall, as far as practicable, be carried out by means of papers and discussions, a library, lectures and classes, a school of architecture, prizes and scholarships, visits to works and buildings, periodical publications, and by such other methods as the Council may determine from time to time. A goodly list. The communication between the members fostered by these methods has led to the formation of many valuable friendships, and will lead to a good many more, for the different societies within this Association which encourage informal, but useful, meetings among our members, are all doing as well as we could wish.

The Camera, Sketch and Debate Club, for instance, has thoroughly justified its existence. Last session it held an excellent exhibition of very good sketches and first-rate photographs, and it has had some good debates. I believe to-day it has just returned from a week-end visit to Cambridge. I hope we shall soon see the result of their sketching and photography in another exhibition. I would commend to its members a consideration of the advantages of joining the Architectural Association annual excursion, in lieu of holding a separate outing of their own in the same month.

Owing to the papers which are read and the discussions which follow them at our ordinary meetings, these are social gatherings as well as opportunities for hearing about something we probably knew nothing about before; we have gained greatly by the departure made last year in combining the alternate meetings with the Camera, Sketch and Debate Club. We have had good meetings and animated discussions. I would like to remind you that the papers which are read at our meetings are usually of a most interesting description; they help to widen a man's general knowledge of art, and we hope to see our younger members coming forward and taking part in the discussions.

The library and periodical publications have made great progress in the last few years. A comparison between our present Journal and the old Architectural Association Notes must be very satisfactory to the Editors of the former, and emphasises their admirable work.

The "Association Sketch Book" has, I rejoice to say—as an old past member of its committee and an old contributor I regard it with particular affection—a new lease of life. Undoubtedly the most useful and best book of its kind, it has at last been discovered by many who previously have closed their eyes to its merits. In consequence of this, it is becoming valued, as it ought to be. I hope, as members of the Association, you will support it by lending your best drawings of old work for publication, and by subscribing the small sum necessary to have the volumes supplied to you.

We have had good competitions for the prizes and scholarships. I am glad to tell you of an alteration which has been made in the conditions of the Travelling Studentship. Formerly this was reserved for those members only who had passed through the School of Design; now it is open to the competition of any member who is under twenty-six years of age. Page 110 of the "Brown Book" will show you that this prize is now more than ever well worth your notice.

With much pleasure I wish to call your attention to the exceedingly good provision which has been made for the athletic side of the Association. Thanks to the untiring efforts of Mr. Alan Potter and other members of the committee, a very good ground has been secured and prepared for football, cricket, and hockey.

On a memorably fine and perfect afternoon last summer the ground was opened with much graciousness by Lady Webb, to the great satisfaction of all present. Now, I need not say much more about the Athletic Club. It can take good care of itself; but I will say this—we ought all to support it. We have all to put in much intellectual work nowadays, and to keep fit intellectually we must keep fit bodily, and the Athletic Club will help us in a particularly delightful way. Do not overlook in your "Brown Book" the page which gives you information concerning the well-known 28th Battalion of the London Regiment, the "Artists." Fortunately, for the good of us all as citizens of this Empire, it is no longer necessary to tell the public school man, on taking up his own citizenship, that it is his duty, if he can pass the necessary tests, to join the Territorial force. The splendid work done by the O.T.C. in the schools of England has spread that knowledge wide. I consider we ought in this Association to either supply a company to the "Artists" from the fine material we have here, or to make notable additions every year to those companies already existing which are mainly recruited from architects. As one who did his few years in the regiment many years ago now, I can testify to the good of the work and the pleasure of the comradeship. In view of the duty to our country in this respect, there ought to be an effort made to give facilities to those students who have to complete their drills.

The large subject of the School of Architecture I deal with more fully presently, but this I will say—that after many years of voluntary and disinterested endeavour the Association has a school which is second to none in this country. When I consider its well-thought-out scheme and many advantages, I am forced to think of the more simple conditions which obtained when I and my contemporaries left school in order to study architecture, some thirty years ago. Perhaps you will not think me too prolix, or too much like the old man whom you know "will be talking," if I recall my own beginnings, and compare them with your own. It was my good fortune in 1879 to be articled for three years to Mr. R. Norman Shaw. You can guess they were happy years. There was much to learn, much to inspire. But at that time there was no organised system of education beyond the term of pupilage, except the instruction given in the evening at the Royal Academy Schools, in some Art Schools, and the voluntary evening classes of this Association. We (I speak of myself and my contemporaries), or most of us, joined the Royal Academy Schools during the term of our pupilage on submitting drawings to prove our fitness for admittance, and worked there in the evenings. On looking back, I think the chief value of that school work was the competitive work for the prizes. It was a good exercise, and lasted some time, for the Academy studentship alone lasted some six years. Travel abroad, working as an assistant, and competing for the Royal Institute prizes filled up our time till, some eight or nine years after the first days of pupilage, we began to practice.

And now, having spoken of those subjects which I wished first of all to mention to you, I pass on to speak more particularly of the School of Architecture and the objects of our education.

When I was thinking of my address to you to-night it occurred to me that I could not do better than begin it by quoting the following words written by our great King Alfred more than a thousand years ago. These words are:—"Thou knowest that no man may understand any craft, or wield any power, unless he have tools and materials. Every craft has its proper tools." It is true that the king was writing about kingly power, and describing the tools and materials necessary to make that power of a fit and noble kind; still, the quotation, so clear and to the point, as was the way of the great ruler and law-giver, sufficiently describes the aim of this Association, which is to give its members power to do good work by the provision of a thorough system of education.

At the risk of being a little tedious, and repeating to-night what a good many here already know very well, I wish in this address which I have the honour, as your President for this year, to make to you this evening, to refer to the work of the Association, and to the influences which now affect it, and to those further influences which might be brought to bear upon it. Although the risk I have mentioned be present, I am the more emboldened to speak on this theme because we have amongst us several new members, who are fresh to the conditions of life in our Association, and unacquainted with some of the movements influencing the current of art life in this country.

Now, the most important work of the Association is the School of Architecture, the successor of the old voluntary system of education for which the Association was primarily founded. The present method of education consists, as you all know, of a four years' course, divided into two years in the day school, and two years in the evening school, during which latter period the student is articled to an architect in practice. By this means the careful preliminary training in the first two years in this school leads up to the combined office and school training in the succeeding two years, a combination obviously of the utmost value to the student.

The course of instruction is an admirable one so far as it goes; the details and effect of its working are always being most carefully watched by the head master and educational staff, and by the Council of the Association, who frequently meet to confer together. A new development has been inaugurated this year. Professor Beresford Pite, himself an old member and past President, well acquainted with the history and work of the Association, has joined the educational staff as Director of Education in the schools. As a master in the evening school, and as lecturer in both the day and evening schools, he will instruct as well as direct. This is an accession of strength to our system which Mr. Maule and the assistant masters have heartily welcomed, and I think we are entitled to congratulate ourselves upon it, and to hope for a continued healthy growth of our means of education.

In addition to the four years' course to which I have referred, I may here announce that it is intended to form at once an advanced class, or a fifth year's course, for those who are desirous—and I believe there are many such—of pushing their studies further.

Hitherto the four years' course has been founded upon the syllabus put forth by the Board of Architectural Education, and a tradition of sound and careful work has been established in the schools, which is constantly growing and expanding to meet the needs of the day. I am aware that there are those who hold that a four-years' course is sufficient for an architectural student before beginning to practice, and particularly for the man who has been to a university. Though I am strongly of opinion that four years is not enough for the greater number of students, I admit there is a good deal to be said for this period of study in the case of those who have spent three or four years at the university, and who have done well there. Time is of consequence in their case, and the trained minds of students who have been through the university course will learn and absorb more quickly than the minds of those who enter the schools here direct from the public schools. For these last I assume, and I believe rightly, that the four years' course is too short a term of instruction, and I believe that the student who makes up his mind to spend the years between eighteen and twenty-eight in the close study of his art, earning his living, if necessary, meanwhile, as others have done before him, as an assistant to architects in practice, before practising as an independent architect, is more likely to become an accomplished artist than he who begins to practice immediately on the conclusion of his articles. It seems to me that if it were possible to combine the general education of a university with the acquirements of the preliminaries of architectural knowledge for perhaps two years after the student has left his public school, it might be very valuable.

These are matters which I hope may come before the Board of Architectural Education for consideration; for I believe it will become necessary for the advantage of our students generally to bring about a co-ordination of the present opportunities for the advanced student who has completed the four years' course, and who does not wish to immediately set up in practice.

At present these opportunities of study are very varied and, I will add, very interesting. To name only a few, there are our own new fifth year's course—and all our students should, if possible, go through the fifth year's course—and the prizes offered by the Royal Academy of Arts and the Royal Institute of British Architects. To obtain one of these prizes confers deserved honour upon him who gains it, and gives him credentials which help him to gain a good position for himself in some form or another, and which makes for him a real start in his artistic life. Besides this, these prizes give to the students the great opportunity of developing their knowledge by travelling for purposes of study.

There exists, however, the difficulty that, while the competition for the prizes of the Royal Institute of British Architects is open to all *bona-fide* architectural students, in the case of the Royal Academy the competitor must have passed through the full terms of studentship. As an old student of the Royal Academy, and one who has a great respect for its system of training, I can understand that its prizes are intended for its own students. But as one anxious to see a higher development of our general educational system I feel it would greatly assist the student of to-day if he might enter he advanced classes of the Royal Academy upon satisfying xaminers as to his ability, without being obliged to go hrough the whole course. For instance, it would be an dvantage for our students who have obtained their certificates here after several years' study to enter the Royal Academy schools to compete for the Gold Medal and Travelling Studentship, and to reap the advantages of meeting ith students who are studying the sister arts of painting nd sculpture. A goodly number of our students are debarred t the present time from doing this, through having to go hrough a probationary course on entrance, equivalent to the arlier years of the course completed by them here.

The training which a student must undergo who intends o compete for one of these prizes is of great importance to im; while the fact that nearly all of them, such as the oyal Academy Gold Medal and Travelling Studentship, the oane Medallion, the Tite Prize, the Pugin, the Owen ones, and others of the Royal Institute of British Architects, carry with them an obligation upon the successful competitor to travel either in England or abroad for purposes f study, constitutes their great educational value. In my pinion, the education of the advanced student is not complete until he has studied abroad. He may do this by independent travel, or he may join for a time the British school t Athens or the great French school—all admirable courses pursue, and well worthy of your attention and consideration.

Further, in connection with this important part of a udent's career, I would like to mention the probable foundation of a large British school for advanced students in Rome. his possibility inspires the hope of an extension of the pportunities for advanced study of a particularly interesting kind. The development of this scheme may necessitate t some future time such a co-ordination of the means of study which I have alluded as might lead to the formation of a reat National School of Fine Art and the crafts of building in this country, of which our schools would form a cognised part.

The formation of such an advanced school does not presuppose any slavish imitation of the French school, though believe we may learn much from that school.

For instance, we must not forget that the well-organised ears of study of the best French students—those, for ample, who have won the Prix de Rome, and have spent the ur years (which is the condition on winning that prize) in e study of old work in Italy and Greece—have contributed the great achievements of French architects during the st two hundred years. It was, at any rate, this very orough system of training which helped Labrouste to build s library of Ste. Geneviève in Paris and his notable additions to the Bibliothèque National; which helped Duban his building at the Beaux-Arts, and Duc at the Palais de stice. We must recollect that the foremost students "set e pace" all the world over, and inspire their fellows to put rth their best powers. We have here in England artistic rces which, if combined, would, I believe, prevent much ste of energy and power, and would tend to the production finer work of a more national character. The chief rinciple which, in my view, leads to success is that, if you e going to be a distinguished artist, you must first of all a distinguished student. No system of education is of use ich does not bring out and form those qualities which make what we know as "character." As the man is, so will his rk be; it is essential, therefore, for a student to have access the best models, and to be brought into contact with the best d highest thought, both ancient and modern. In this way ll his own character be formed by the true artistic influence ich flows from great men and great work. Carlyle says in true works of art the God-like is rendered visible. If the artist must be creative, and our aim should be to make r students receptive, imaginative, and fruitful in ideas and sign, so that they may become creators of beauty. Our otto is "Design with beauty, build in truth." We might ll add Shakespeare's words, "By knowledge are we lifted to the Gates of Heaven." To our students I would say the motto of your Association become your own motto, and th it in your hearts take full advantage of the education ered to you here in both schools, remembering that the ning school is the complement of the day school. Make it aim to keep yourselves ever open to the artistic influence sincere and truthful study. Robert Louis Stevenson, in of his delightful essays, says that the best artist is not man who keeps his eye fixed on posterity, but the one o loves the practice of his art. And no art can give its author more intense pleasure than the mistress one to which you are devoted. Beauty in architecture has many manifestations; you may have it in the exquisitely delicate and refined detail, or in that which is splendidly bold; in the stately and dignified plan and elevation; in the fine lines of the column; or in the sense of superb scale. We have in England to struggle against the small and petty detail which disfigures building after building to-day. We need to absorb into our minds the principles of broad and fine work. Look, for instance, at a fine capital of a pilaster of Francis the First's time; the sweep of the line of the horns or volutes, as vigorous as the clean line of a rapier, the flat relief of the intermediate carving as delicate as the damascene pattern on its blade.

(To be concluded.)

SOCIETY OF ARTS' ADELPHI PREMISES.

IN the latest number of the "Journal of the Royal Society of Arts" an interesting account appears from the pen of Sir Henry Trueman Wood, M.A., the Secretary, of the various offices rented by the Society since 1755. During the four following years their tenancy scarcely averaged a year at each place. But in 1759 they rented premises opposite Beaufort Buildings in the Strand. In 1770, the lease of the Society's premises having nearly expired, and the accommodation being again found insufficient, it was decided to advertise for new premises, and accordingly an announcement was inserted in some of the daily papers inviting any person who had proposals to make for the accommodation of the Society to communicate with the secretary.

The result of this advertisement was that the Brothers Adam, who were then occupied with their scheme for the construction of the Adelphi, offered to include in that scheme a suitable house for the Society's purposes.

The history of the Adelphi has often been written. The site was long occupied by the historic buildings of Durham House, the residence of the Prince-Bishops of the northern See. The house and grounds originally occupied the area between Adam Street and Buckingham Street, from the Strand to the river. The New Exchange was built in 1608 by Lord Salisbury on the site of the Durham House stables, and extended from George Court to what used to be Durham Yard, but is now Durham House Street. It thus included the site of Coutts's old Bank. It was pulled down in 1737, when shops and houses were erected along the present line of the Strand. In the space between these buildings and the river, where old Durham House once stood, fronting the river, with its gardens reaching to the Strand, were "a number of small low-lying houses, coal-sheds, and lay-stalls, washed by the muddy waters of the Thames." The ground sloped down from the Strand level to the brink of the river, which must have been, at high water, somewhere about the inner edge of the Embankment Gardens.

On this slope the Brothers Adam (Robert, William, James and John) proposed to build a great terrace, level with the Strand, the idea being taken from the arched terrace or gallery in the Palace of Diocletian at Spalato, which Robert Adam studied with great care, and described in a monumental folio.* The ground was in the possession of the spendthrift Duke of St. Albans, or rather of his trustees. By the year 1642 the estate had finally passed out of the possession of the Bishops of Durham, and under the provisions of an Act of Parliament it became the property of the Earl of Pembroke and Montgomery, a rent-charge only of £200 a year being reserved to the See of Durham. This rent-charge, it may be interesting to mention, is still paid by the present owner to the Ecclesiastical Commissioners. In 1677 the estate was sold by the Earl of Pembroke to Sir Thomas Monpesson, and in 1716 it was again sold by the representatives of Sir Thomas Monpesson to the trustees of the will of Sir John Werden, whose daughter Lucy married Charles, the second Duke of St. Albans. Their son George, the third Duke, brought the estate into settlement, and in 1767 a private Act of Parliament was passed for vesting part of his estates in trustees for the purpose of raising money to pay his debts.

These trustees, Lord Charles Spencer and Sir Philip Musgrove, in 1768 granted a lease to the Brothers Adam for ninety-nine years at a rent of £1,200 a year. It has seemed worth while to record these details because they have never been accurately stated in previous accounts of the Adelphi.

---

* "Ruins of the Palace of the Emperor Diocletian at Spalato in Dalmatia," by R. Adam, F.R.S., F.S.A., 1764.

The design proposed by the Brothers Adam was duly carried into effect, the requisite height on the river side being obtained by the construction of tiers of superimposed arches. Some of these arches formed public thoroughfares, and later gained an unenviable reputation on account of their nocturnal frequenters. Others were let as storehouses; at one time a number of cows were stabled in some of the arches, and supplied milk to a large part of the West End. Others, again, served as cellars for the houses built on the substructure. The Society's house has two storeys of cellars below the south-western part of the building, while the foundations of the north-east corner are in the original ground. The whole work has undergone a certain amount of repair, a good deal of strengthening and reconstruction having been carried out about the time of the termination of the original lease, when the Thames Embankment was made (1862-1870); but it seems now as sound as when it was first built. The view of the Adelphi in a contemporary print justifies Horace Walpole's criticism (quoted by Mr. Wheatley) that the Adelphi buildings resembled "warehouses laced down the seams, like a soldier's trull in a regimental old coat." There are still two or three houses in the Adelphi which preserve this old form of decoration—long vertical mouldings extending from the ground to the uppermost storey.

The work, commenced in July 1768, was practically completed in about six years, but before it was finished the Adams were in financial difficulties. In the course of their operations they encroached on the foreshore of the Thames, and thereby involved themselves in a dispute with the Corporation, their difficulties being increased by the political circumstances of the time, as the Corporation were strongly Wilkesite, while the Adams enjoyed Court favour. Eventually they succeeded in obtaining an Act of Parliament to authorise their proceedings. In this they were assisted by their patron, the Earl of Bute. Their pecuniary difficulties were set right by means of a second Act, which empowered them to organise a lottery, the chief prizes in which were the houses then in course of building on the estate. In many cases the prize-winners sold their rights, and thus the subleases became the property of various owners. Their tenures expired at the termination of the principal lease in 1867, long before which time (in 1787) the property had come into the possession of the Drummond family. George, the third Duke of St. Albans, had no son, and was succeeded as fourth Duke by George Beauclerk, the grandson of Lord William Beauclerk, the second son of the first Duke, who had married (in 1744) Charlotte, the other daughter of Sir John Werden above mentioned. Lord William Beauclerk's daughter Charlotte married John Drummond, the son and successor of the Hon. Andrew Drummond, the founder of Drummond's Bank, and to her the Aldelphi estate was devised by her nephew, the fourth Duke. From her son George the estate passed to his son, his grandson, and his great-grandson, George James Drummond, the present owner of the estate and the Society's landlord.

John Drummond and his cousin Robert were among the earliest members of the Society, and the connection of the family with the Society has since continued.

Negotiations, the progress of which is described, though not very fully, in the old Minute-books of the Society, went on for some time, and eventually the Adams undertook to build a house such as was required for a premium of £1,170, and a rent which was finally settled at £200 a year. The plans, after much discussion, were finally approved, the foundation-stone was laid by Lord Romney in 1772, and the Society entered into possession in 1774, though the lease only dates from 1775. It was for 91½ years, from Midsummer 1775, ending at Christmas 1866—a quarter before the end of the landlords' lease.

Such was the origin of the historic building in which the Society has carried on its work for 135 years. It really consists of two houses, one of which was intended for the private residence of the secretary. There has always been a communication between the houses on the ground and first floor (as well as in the basement), and recently a third one was constructed on the second floor. Otherwise the two houses are separate and distinct. The last secretary to live on the premises was Sir George Grove.

No structural alterations of any importance seem ever to have been made in it.

In 1774, when the Society was about to move into its new house in the Adelphi, the question of the decoration of the Great Room naturally gave rise to a good deal of discussion. It was determined that it would be desirable to procure "proper historical or allegorical pictures," to be painted by the most eminent artists. Further, it was decided that there ought to be eight historical and two allegorical pictures; that the subjects of the historical pictures should be taken from English history, and that the allegorical pictures should be "emblematick designs relative to the Institution and views of the Society." A proposal was accordingly made to eight artists, that they should paint each a historical picture, and to two others that they should paint allegorical pictures, the conditions being that they should not be paid, but should receive the profits arising from an exhibition of the pictures, to be held for four months. The historical painters were Angelica Kauffman, Sir Joshua Reynolds, West, Cipriani, Dance, Mortimer, Barry, and Wright; the allegorical painters, Romney and Penny. Mr. Valentine Green, the engraver, was requested to communicate with the selected artists, and to report their answer. Unfortunately, the answer—mainly, it appears, owing to Sir Joshua Reynolds—was a refusal. The portraits of the first two Presidents of the Society—Lord Folkestone and Lord Romney—the first by Gainsborough and the second by Sir Joshua—were placed over the two chimney-pieces, and there the matter rested for a while.

Three years afterwards, viz. in 1777, Barry authorised the same Mr. Green—a member of the Society who took a very active interest in its welfare, and who afterwards received a gold medal on that account—to inform the members that one of the Royal Academicians they had applied to was willing to take the whole work upon himself, and to decorate the Great Room "with a series of pictures analogous to the views of the Institution." It was estimated that the canvas, frames, and colours would cost £100, and there was a further expense of £30 for models, which the artist offered to discharge, but which was eventually paid by the Society. The proposal made at one ordinary meeting of the Society was referred to the committee of "Polite Arts." The committee considered and accepted it before it was known who the artist was to be, and thereupon the chairman produced a letter from Barry, stating that the offer was his. Barry was then young and little known, full of confidence in his own powers, and assured that nothing but opportunity was wanting for him to make a reputation. Nor were his objects wholly personal. He was impressed—as well he might be—with the degraded condition of English Art, "fitted for nothing greater than portraits and other low matters, from whence no honour could be derived either to the artist or the country," and he believed that the production of "some great work of historical painting" would refute the assertions of those foreign critics who declared English painters to be incapable of any permanent work, and would also serve as an example to his countrymen. Feeling at once the necessity of the work, and the capacity within himself for executing it, he set himself to do it, without, as it seems considering or caring even how he was to live during all the years so long a task must occupy.

On the whole, his hopes of fame were realised, for such reputation as Barry now possesses rests entirely on the great pictures he painted for the Society. The man himself was of a strange character, his life was by no means happy. An artist of considerable power, his powers were yet not equa to his own estimation of them; and his life, like that of Haydon, a few years later, was embittered by what he considered a lack of appreciation of his deserts.

In 1777 he began the pictures in the Society's meeting room. In 1782, after they were completed, he was appointed Professor of Painting to the Royal Academy. His caree in this office was by no means happy. He seems to have been afflicted with an irritable, cross-grained temper, and this led him into disputes with everybody with whom he came in contact. Finally, he quarrelled with the Roya Academy itself, so that he was expelled from it in 1799. He grumbled at the Society, which seems to have treated him with sufficient liberality, for it had either given him, or assisted him to get by exhibitions a sum amounting altogether to £700 while the members of the Society raised £1,000, and purchased an annuity of £120, but, unfortunately, only a month before his death, under very miserable conditions. His body was placed in the Society's Great Room for a day before it was carried to St. Paul's, to be laid beside that of Reynolds

When Barry began his task he had, it is said, only sixtee shillings in his pocket, and he supported himself while it wa in progress by etching. He applied to patrons, principall members of the Society, for a loan to assist him while h was at work, but it does not appear whether his applications ere successful. The exact date at which the work was ommenced is not stated in the Society's Minutes, but the ictures were well advanced by the recess of 1778, when e key of the Great Room was entrusted to Barry, in order at he might work without interruption; and the work was ntinued until October 1781. During its progress the ociety's meetings were at first held in the Great Room, the ictures being covered up with canvas; but in 1781 the eetings were held in the committee room—*i.e.* the present ouncil room—the Great Room being given up entirely to e artist. In the same year, frames, designed by Barry mself, were procured from Mr. Adrian Maskens, of Comp- n Street, Soho, at the expense of £100 17*s*. These frames e those in which the pictures now are, though they have, course, been regilt since they were first put up.

A suggestion, made by the painter, that some portraits members of the Society should be introduced gave rise considerable discussion, and seems to have exercised the inds of the committee of "Polite Arts" for some time, but entually a selection was made. As soon as the work was ished, a public exhibition of the pictures was held for the inter's benefit. They were shown for two months during '83, and for the same time during 1784. The cost of these o exhibitions was defrayed by the Society, and amounted £174. 6,441 persons attended the first exhibition and 511 the second, among them being Jonas Hanway—the troducer of umbrellas—who was so pleased with the pictures at he showed his gratification by the very practical step of anging the shilling he had paid for admission for a inea as he left. The exhibitions produced £503 12*s*. ngratulations poured in upon the artist, accompanied in ne few cases at least by subscriptions or orders for paintings. it the measure of praise his pictures received was by no eans equal to the artist's estimate of their deserts. In a ter, dated October 1784, to the president and members of e Society, we find him complaining bitterly of this want taste on the part of the public. Sixteen or eighteen thou- nd pounds had, he says, been squandered that year at estminster upon a "Jubilee of hackney'd German musick," an empty hubbub of hundreds of fiddles and drums, which s dissipated in the air as soon as performed." This, too, d been attended by "well-dressed people of the first rank d condition, great Lords and Ladies with white wands, e ribbans, and medals." Meanwhile his pictures, which re to have revolutionised English art, were being neglected the Adelphi.

A full account of the pictures is given in Barry's own rk. The whole series of pictures was intended "to illus- te this great maxim or moral truth—viz. that the obtain- g happiness, as well individual as public, depends on ltivating the human faculties. To prove the truth of this ctrine, the first picture exhibits mankind in a savage te, full of imperfection, inconvenience and misery. The ond represents a Harvest Home, or Thanksgiving to Ceres d Bacchus. The third, The Victors at Olympia. The urth, Navigation, or the Triumph of the Thames. The th, the Distribution of Rewards by the Society. And the th, Elysium, or the State of Final Retribution. Three of se subjects are truly poetical, the others historical."

The height of all the pictures is the same, 11 feet 10 inches. e first, second, fourth, and fifth, being those at the ends the room, are each 15 feet 2 inches long; the third and th, which occupy the north and south sides of the room, each 42 feet long. They all take up the upper portion the wall, leaving a space beneath them of 10 feet 6 inches wn to the ground.

The six pictures did not occupy the whole wall of the m, the spaces over the chimney-pieces at either end being ied by portraits of Lords Romney and Folkestone. It s not appear that Barry's original design included tures for these spaces, but we find him, in 1801, expressing wish that these two portraits should be placed in some er room of the Society, and that he should be allowed execute pictures which might fill the vacant spaces. This was willing to do without charge, and without interruption he business of the Society. The cost of them would not, said, exceed £10 for canvas and stretchers. It may be posed, and, indeed, it appears from the style of the letter, t he was, at that time, perfectly well satisfied with the atment he had received from the Society, for he expresses self as being "both gratified and flattered with the lick reputation of the pictures." Permission was given Barry to carry out his scheme, and it may be presumed that vas upon the receipt of such permission that he prepared two designs which are still preserved amongst his etchings, representing George III. and Queen Caroline. But, although the proposal was at first readily accepted, it seems to have given rise to some difference of opinion, for the then President, the Duke of Norfolk, notified his intention of moving to rescind the resolution of the Society for the removal of the portraits. Under these circumstances Barry at once withdrew his offer, at the same time disclaiming any intention to show disrespect to the memory of the first two Presidents of the Society. He urges very fairly that another position might be found for the pictures, which would be in no way injured, and that his design could then be harmoniously completed. Coming from a man of his temper, it must be allowed that his second letter is most dignified, and in excellent taste. The portraits consequently remained in their places until 1864, when they were removed to make way for the portraits of the Prince Consort and the Queen, by J. C. Horsley, R.A., and W. C. Cope, R.A. These, with the bust of Prince Albert now standing in the ante-room, form the memorial which was provided in 1863 by subscriptions from members of the Society in memory of their President.

ARCHITECTURAL EDUCATION.*

(*Concluded from last week.*)

THE study of materials is primary to the architect, then the study of construction and purpose, followed by such æsthetic considerations as have not been evolved in their progress through an artistic mind. The impressiveness, which is architectural, in the Temple of the Sphinx has its main sources in these three primary streams; they here combine in a building that owes nothing to what is commonly regarded as architectural detail or to æsthetic considerations. Dignity, fitness, and security are expressed alike by the material, construction, and arrangement.

Material, though a constructive element, has however an æsthetic quality if it governs, as it should, the genesis of the detailed form. It imparts the quality of texture, so little understood in English practice. The general tendency here is to confuse it with the decorative values of materials, which lie solely in their superficial colour or polish. The æsthetic value of a building material, however commonplace its nature, is to be expressed by its use and workmanship, forms deriving character from its natural qualities; and without this æsthetic expression of the texture of material the finer effects of architecture cannot be realised. Into the appreciation of building texture costliness or intrinsic beauty, such as that of marbles, veneers, or of colour veinings or contrasts of richness, do not enter; this decorative aspect of building materials has little to do with the essence of architecture, though one of the first among those many accessories conveniently described as "handmaids." The same considerations which govern the decorative painting of interiors apply generally to the use of materials for their colour or superficial value. Though the student of building construction can be safely advised not to concern himself with these for a while, he cannot undertake as an architect the sympathetic study of materials, for the purpose of designing with them, with no other sense of texture than that which recognises the similarity of red Mansfield stone with red brick, and employs them in juxtaposition to express their common red characteristics. A true perception of texture as a constructive and artistic quality will endow the use of our ordinary building materials, whether employed in important and great works or in such humbler things as warehouses, cottages, or even garden walls, with direct interest and beauty. The student may assure himself that if the texture of each material and its related craft is thoroughly comprehended he will have at hand a fountain of simple beauty which will give new vigour to design, and which will, besides, place for him the study of ornament upon a new and vital basis. Pseudo-architectural forms which are lifeless apart from their original purpose and material will be replaced by the new stimulus of seeking to express the possibilities and quality of the modern material in his hands.

Will beauty of form, however, attend upon beautiful building construction? It will be fairly obvious to a generation such as ours, reared into a general sense of architectural fitness by education in the mixed particulars of illogical standards of taste, that it will not be so. As a matter of course, to such any beautiful architectural forms must be derived from some extraneous source and applied to the building, as it would be impossible, for a dilettante, to con-

ceive of building construction as otherwise than Philistinic and ugly.

If this prevalent view is correct and to be maintained by education, we must have a new term for beauty in architecture, beautiful architecture and beautiful building not being identical and not necessarily connected. It is a consequence of this prevalent view that building construction books and those on architectural history proper have dealt with apparently different subjects, the former with the matter-of-fact necessities of building, and the latter with the forms which impart architectural beauty. This conclusion, I fear, represents the state of the case in the minds of present-day authorities; the grouping of subjects and books, schemes of architectural examination and of education leading thereto seem to have as their basis the segregation of the arts of design from the practice of construction. The student is expected to sort himself either as a constructor or artist, and nourish his bent accordingly, and in either compartment he is secure from becoming a great architect.

A definition which seeks for intellectual expression in building construction as the secret of true architectural beauty will almost satisfy the inquiry as to the relation of beauty of form to building art. Refinement and adornment follow upon this premise, and it need not be considered that the bare requirements of an inclosing construction is all the building art allows. The Great Pyramid, the Parthenon, the Pantheon, a mediæval vaulted cathedral, or a Renaissance dome each exemplify the operation of trained intellect o constructive problems.

It would be an affectation to suggest that books or lecture dealing practically with the needs of a student of buildin could impart the art of architecture, but it should be claime that the student of construction should discern the element of architectural beauty in that subject, just as in the stud of beautiful buildings they should be attracted to their fundamentally architectural construction.

The purport of this introductory address is fulfilled i pointing out that the studies of the architectural studen should concentrate upon the motives and materials of construction as true sources of varied streams of interest an beauty. Apart from passing fashions, these make architecture permanently effective. Underlying my purpose has bee the hope of linking ancient reference with present practic by a linked study of historical buildings, in order to avoi such a concentration of attention on modern use in construction as would relegate precedent to what would improperly b called the artistic side of the architecture. A very narro view of artistic architecture only would either profess disregard for the modern sense in construction or the ancient i form; the true view equally observes both in each; th artistic architect and the practical builder are not properl separate entities or corporations.

This basis of study is the ideal for the architect; t illustrate and prove it would be easier from the standpoin

a review of past works of architecture than of the means w at hand of achieving fresh ones, but the present is the st living force with which the student will have to engage, l, modern architecture having nothing wherewith to express rself but building construction, to us the more necessary dy shall have the more abundant comeliness.

Of other forces, of the power of the past, of the aspirations pure artists who were not constructors, we may be led to ak later in dealing with the historical progression of build- experiment.

Mr. H. P. G. Maule proposed a vote of thanks to Professor e for his address. The line which had been taken by fessor Pite entirely coincided with the efforts of their ool, *i.e.* to drive home to students the absolute importance he scientific and æsthetic study of materials and construc- n.

The vote was carried by loud acclamation. Professor Pite his concluding remarks said he did not see why they should have the finest school of architecture in the country. Why uld they not produce better drawings than they did in is? Before that could be realised they would have to carry ir education a great deal further than it had been in the t. He hoped the time would come when there would be admission examination to the A.A. School which would be ut the same standard as that of the R.I.B.A. Intermediate.

LONDON UNIVERSITY EXTENSION LECTURES AT BRITISH MUSEUM.

MR. BANISTER FLETCHER, F.R.I.B.A., gave the first of a course of twenty-four University Extension Lectures on "Ancient Architecture" at the British Museum last Tuesday.

He first dealt with the nature of the lectures to be given under the auspices of the University of London during the coming winter, saying that he would trace the evolution of ancient architecture in Egypt, Assyria, Greece, Rome, and Byzantium on broad lines from a popular point of view.

Architecture, the lecturer explained, was the visible exponent of civilisation embracing the other arts, and all present-day buildings were founded upon old art suited to modern needs. The study of architecture was thus necessary to architects, craftsmen, and art students, and further, it would be difficult to find anyone to whom a knowledge of the subject would not be beneficial. The author, journalist, photographer, and antiquary all required a knowledge of the evolution of the successive periods of architecture in order to help them in their work. The teaching profession now also endeavours to make history interesting by referring to the dwellings and temples constructed by the different peoples to suit their social and political requirements.

A knowledge of architectural history also added much to the enjoyment and benefit of travel which is so popular in these days of quick and easy transit, for it would enable travellers to take an intelligent interest in the buildings and monuments they saw, from which the history of the past could be gleaned. By the study of the most beautiful buildings which had been erected in past ages, an improvement in the architecture of our own country would assuredly result.

The lectures are to be illustrated by some twelve hundred views, the object being to transport students, as it were, to the actual sites, and so familiarise them with the principal buildings, so that during the twenty-four hours thus spent they would be enabled to study what would require in actual travel at least as many months.

Mr. Fletcher next gave a short illustrated review of ancient architecture in order to show the different types of buildings, and referred to the various influences—geographical, geological, climatic, religious, social, and political and historical—which aided in their evolution. He mentioned the world famous Sphinx—a sentinel of the past—and the massive temples and tombs of the Egyptians, the palaces of the Assyrians, the temples of the Greeks, *e.g.*, the Parthenon and the Erechtheion, and their open air theatres, the great buildings of the Romans, including the Baths of Caracalla, and stupendous Colosseum at Rome, the arches of triumph, and the dwellings at Pompeii, the Congregational Churches of the Early Christians, and the peculiar types of buildings erected under the influence of Byzantium, the lecturer pointing out the peculiarity of structure and design in each case. These buildings were shown by means of beautiful slides, making it quite easy to follow in detail the explanations.

Obviously, the British Museum, which contains the world's richest collection of ancient fragments of art, is an ideal place for such a course of lectures, because they can be referred to in the visiting class which is held after each lecture, thus enabling students to follow the historical sequence by looking at actual examples.

The lectures are delivered on Tuesday afternoons at 4.30, in the Assyrian Saloon. The subject of the next lecture will be "Egyptian Architecture." All particulars can be obtained from Miss Gaudet, the hon. secretary of the course, 120 Cheyne Walk, Chelsea, S.W.

VICTORIA AND ALBERT MUSEUM LONDON UNIVERSITY EXTENSION LECTURES.

Mr. BANISTER FLETCHER gave on Monday last the first of a course of twenty-four University Extension lectures on "Renaissance Architecture," under the auspices of the University of London, at the Victoria and Albert Museum, South Kensington, S.W.

He explained that he would deal with architectural history from a popular point of view, and trace its evolution in the countries of Europe. He referred to the history of architecture as a visible exponent of civilisation uniting and embracing the other arts, and pointed out that all modern design was founded upon old art, but altered in order to conform to existing conditions. A knowledge of architecture is necessary to architects, craftsmen, and art students, and authors also require a knowledge of it for the setting of an historical novel, because a mere story about people without reference to the buildings in which they lived would remain dull and uninteresting. The antiquary and the connoisseur should also be interested, for the fascination of collecting is much increased by a knowledge of the dates and periods of architecture. The teaching profession is beginning to realise that to make history interesting the students should be shown the type of buildings in which our ancestors lived and worshipped.

A knowledge of architectural history was indispensable to all who travelled, for to travel without such a knowledge was like having a book in front of one without the ability to read it.

Some 1,200 views of Renaissance buildings would be shown, the object being to transport students to the actual sites, and so familiarise them with the buildings in the different countries of Europe—this should prove valuable alike to those who had, or had not, the time and means to travel.

Mr. Fletcher next gave a short illustrated résumé of ancient and mediæval architecture, in order to show the evolution of architectural forms from the earliest times.

He then dealt with some of the influences at work during the Renaissance period; the writings of Dante, Petrarch, and Boccaccio, the newly discovered MSS. of the classic authors, the fall of Constantinople, the three great inventions—gunpowder, the mariners' compass, and printing—which helped to form a new spirit of inquiry, leading in some countries to the Reformation.

Renaissance architecture could be defined as the architecure of Western Europe, which sprung up on the decline of Gothic architecture in the fifteenth century A.D., and lasted till the present time. It started at Florence early in the fifteenth century, and although it meant the re-birth or revival of Roman architecture, yet the influence of Gothic art was apparent, and it was wrong to say that it was merely a copying of Roman art. From Florence the new style spread to the other countries of Europe, in each of which, however a new version was given to it owing to local influences, such as climate, material, or historical events and the traditions of styles previously in vogue.

The lecturer then proceeded to show a number of views o Renaissance buildings in France, Germany, Belgium, Holland, Spain, and England, indicating their peculiar features In conclusion, the lecturer said that he would endeavour t introduce the atmosphere of the Renaissance period into the lectures, so as to form a connection between history and architecture, and hoped that at the end of the course they would appreciate old buildings as they would be able to study their life history, and understand how they had been raised An improvement in English architecture would undoubtedly be brought about by the study of the most beautiful example of past styles.

The Museum contains a remarkable collection of Renaissance architecture which will be studied in the visiting clas held in connection with each lecture, and this systemati study should make the Museum more useful to the public.

The lectures are given on Monday afternoons at 5 P.M., i the Lecture Theatre of the Victoria and Albert Museum South Kensington, S.W. The next lecture will be a illustrated "Comparative Analysis of Mediæval and Renaissance Architecture."

Particulars of the course can be obtained from Mis Gaudet, the hon. secretary, 120 Cheyne Walk, Chelsea, S.W

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.

THE first meeting of the session in connection with th Architectural Craftsmen's Society was held last Frida in the Technical College, Glasgow. Mr. James S. Boy Licentiate R.I.B.A., in his presidential address, dealt wit "The application of practical geometry to the solution problems in stone-cutting and to the full-size drawing dow and mould-cutting in masonry work." Referring to the trai ing of young masons who desired to qualify themselves foremen, he said that they should cultivate skill in the appl cation of practical geometry to the varied and complicate masonry problems which at times occur. Mr. Boyd demo strated several methods of setting out arches of various form on the drawing floor, and described how the moulds ar levels were developed in work of double curvature, ske bridges, interpenetrations of vaults, domes and other co plex masonry structures. Referring to the cutting of zi moulds, he condemned the general custom of giving th work to the joiner, instead of the mason, on whom rest the responsibility of producing correct work. In concludin he recommended young masons to uphold the dignity of the craft by making themselves thoroughly efficient, not mere as hewers of stone, but as scientific craftsmen.

COMPETITION NEWS.

Bristol.—The Grand Hotel Co. (Bristol), Ltd., announ that applications for particulars with regard to the propos alterations will not be considered unless received by Satu day next, October 7. All plans and designs, with estimat cost of alterations, must be deposited at the office of t Secretary, 44 Corn Street, Bristol, on or before October Drawings should not be signed, but names forwarded und separate cover, an identifying "nom-de-plume" appeari on both drawings and letter.

The Institute of Sanitary Engineers will hold its openi Sessional Meeting at Caxton Hall, Westminster, on Monda October 9, at 7.30 P.M. The President, Mr. A. J. Marti M.Inst.C.E., &c., will give an address on the programme f the session. A musical entertainment and light refreshmen will be provided. Admission tickets (free) and any furth information may be obtained on application to the Secretar 120-122 Victoria Street, Westminster, S.W.

FORTHCOMING EVENTS.

Monday, October 16.

Architectural Association : Mr. Raymond Unwin on "Town Planning, Formal or Irregular?"

Thursday, October 19.

Society of Architects : Twenty-seventh Annual General Meeting, University College, London; Second of a course of eight public lectures on "English Mediæval Architecture," by Mr. E. S. Prior, F.R.I.B.A.

Friday, October 20.

Royal Archæological Institute : Visit to Westminster Abbey to study the mediæval monuments and furniture.

Saturday, October 21.

Institution of Municipal Engineers : Third Annual General Meeting, at Windsor.

THE COMPOSITION AND STRENGTH OF MORTARS.

THE usually accepted rule-of-thumb specification for the proportion of one part of lime to three of sand r mortar, without consideration of the kind of lime or ariety of sand, is on the face of it unscientific, and whilst might be supposed to be a fairly accurate generalisation om experience and tradition, must be open to advan- geous modification under varying conditions. To ascer- in the extent and nature of that modification experiment obviously required, and we therefore welcome the ppearance of the report* of Mr. W. J. Dibdin on vestigations carried out at the instance of the Science tanding Committee of the Royal Institute of British rchitects.

Experiments have been made with three kinds of lime d five varieties of sand, giving in combination fifteen fferent classes of ordinary mortar, besides others in hich abnormal compositions have been tested, of which e shall speak later. Investigations have also been made the character and composition of twenty-nine ecimens of ancient mortar of various dates, from oman times to about the year 1800 A.D. It is curious notice that the rule-of-thumb proportion of one of ne to three of sand is justified neither by ancient actice nor by modern experiment. In only two cases d the samples of old mortar contain as large a proporon of aggregate as three to one, and of the fifteen modern ortars two gave their best results with a proportion of ree to one, two with three and a-half to one, four with o and a-half to one, and seven with two to one.

The limes with which experiments were made were hite chalk lime, Dorking grey-stone lime, and blue lias ne, whilst the aggregates with which these limes were mpounded were Leighton Buzzard standard sand, fine nd from Charlton, pit sand, Thames sand, and ground ick. Of these the order of fineness was Charlton sand, ound brick, pit sand, Thames sand, standard sand.

The general results of the experiments show that th varied combinations of lime and aggregate different oportions give the greatest strength, that the same proortions in any given combination do not necessarily give equally high ratio of strength in tension and in comession, that "green" mortar is frequently stronger than that two years old, especially in weak combinations. Hence the important lesson is clearly established that for any particular combination of lime and aggregate there is a particular proportion which will give the best results.

Thus white chalk lime with standard sand reaches its highest crushing strength with a proportion of three and a-half to one, but with Thames sand the ratio must be two to one. Dorking grey-stone lime developes its greatest strength with ground brick in the proportion of three and a-half to one, and with Thames sand requires the ratio of two to one. Blue lias lime will take three to one with pit sand and two and a-half to one with Thames sand. So one can also compare the varied results with any given aggregate: thus, for example, ground brick, to make the strongest mortar, requires a ratio of three to one with white chalk lime, three and a-half to one with Dorking grey-stone lime, and two to one with blue lias lime.

Not only do the most satisfactory proportions vary with each combination of lime and aggregate, but certain limes give better results with certain sands, and other limes with other sands. Thus, white chalk lime gives the strongest crushing strength with fine sand, but greystone lime with pit sand. The experimental results with tensile stress vary in a similar manner, but do not run on parallel lines with those for crushing stress. Thus it is by no means a simple matter to specify the right proportion of lime to sand in order to obtain the strongest mortar, and no one general formula will suffice for all cases.

Another line of investigation which has been pursued by Mr. Dibdin relates to the effect of mixing a small proportion of clay with the aggregate used in making mortar. The experiments made in this direction were limited in number and in scope, but gave interesting and valuable information. With each kind of lime as used in the ordinary mortar tests, three varieties of aggregate—standard sand, fine Charlton sand, and pit sand—were tested in a combination of three to one with 5 per cent. addition of red London clay. The general result was that with fine sand the addition of clay brought about a serious deterioration of crushing strength, with coarse sand there was some diminution in combination with white chalk and grey-stone limes, and a considerable increase of strength with blue lias lime and coarse sand.

Tests for ascertaining the adhesive power of certain mortars to two qualities of bricks—stock and Fletton—were made by Mr. Dibdin, and their results are given in his report. From these it appears that the adhesive power of the mortar is considerably greater in the case of Fletton bricks than with stock bricks and with ground

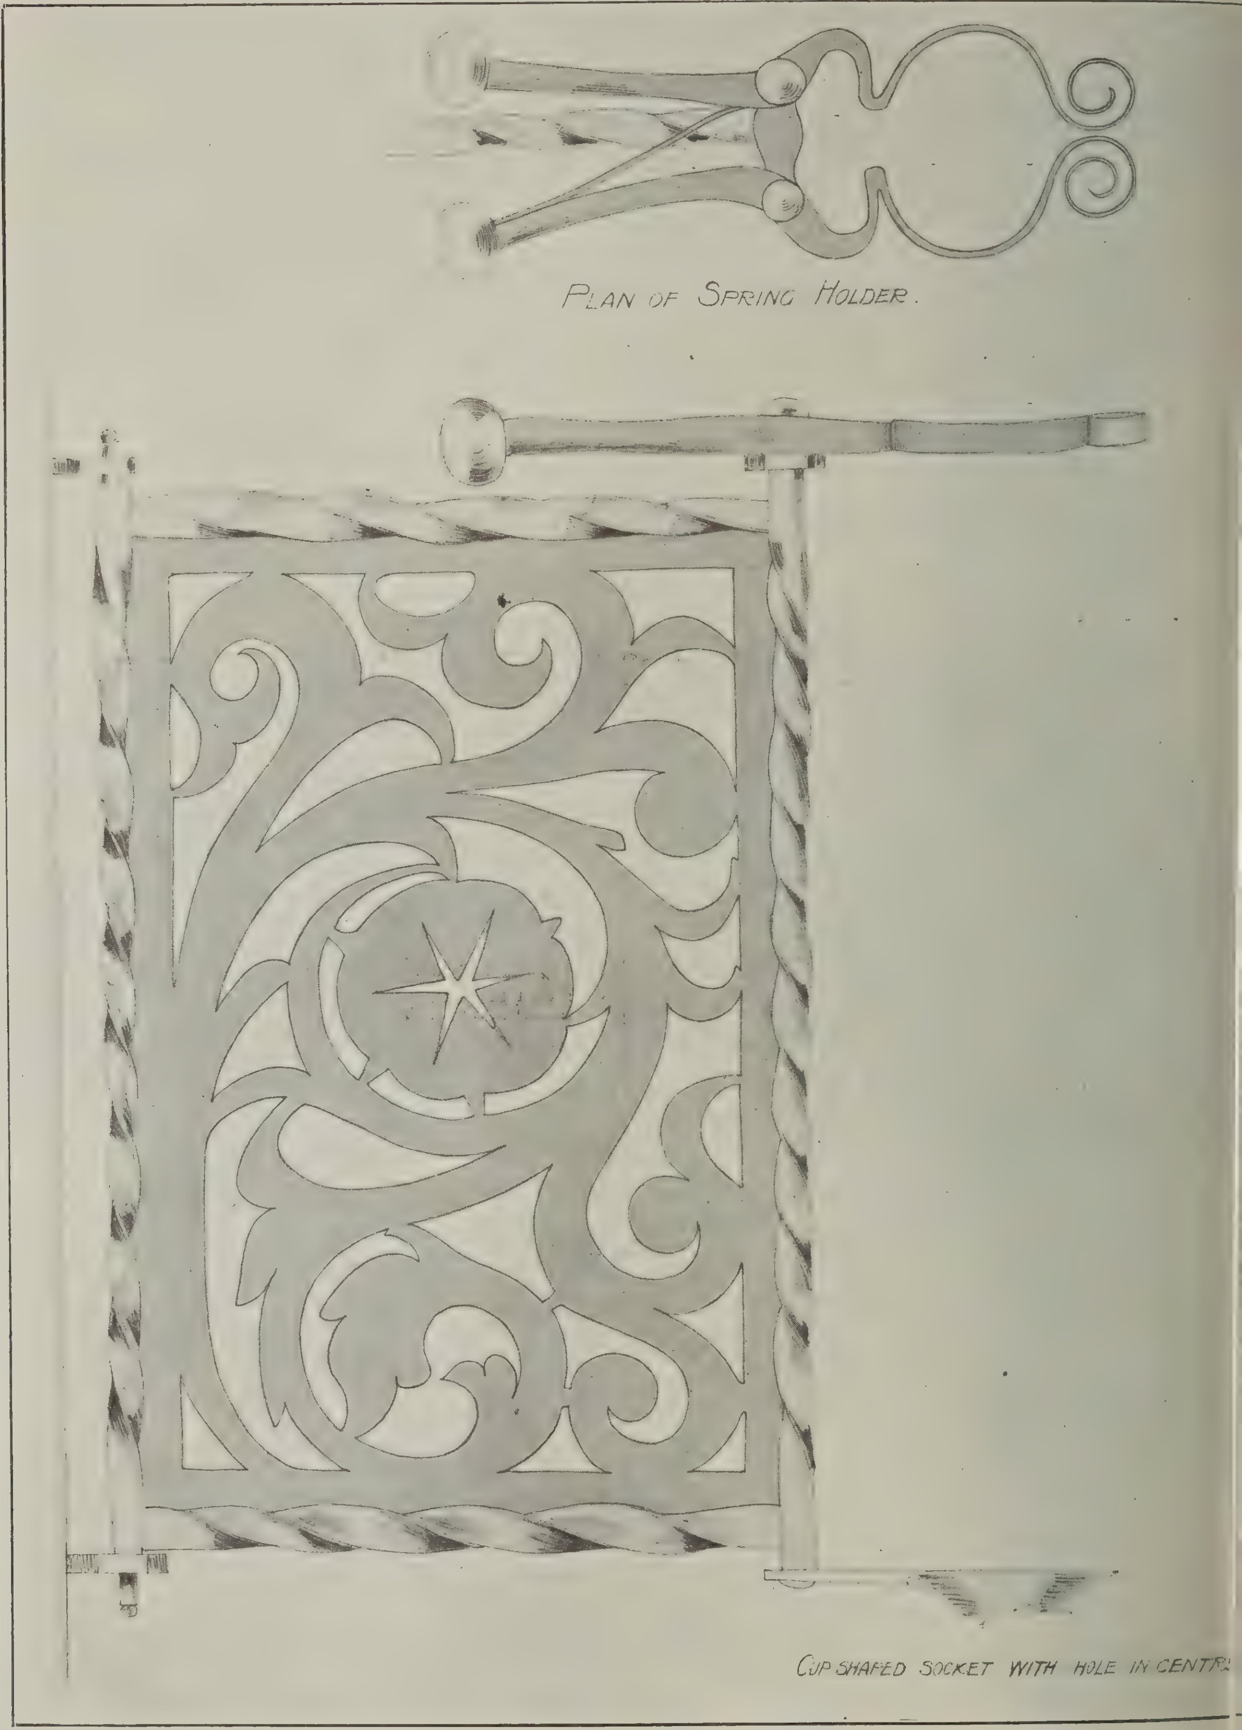
* *The Composition and Strength of Mortars.* Report on the ults of the experimental investigation conducted for the Science. nding Committee of the Royal Institute of British Architectse W. J. Dibdin, F.I.C., F.C.S., &c. (London : The Royal Institut British Architects. 5*s.*)

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



WROUGHT-IRON BRACKET, ST. JOHN'S CHURCH, LEEDS.—Drawn by Mr. E. H. Gibson.

ST. JOHN'S CHURCH, Leeds, was built between 1632-33 by John Harrison, a citizen of Leeds. The plan consists of two aisles of equal size, with a square tower at the west end of the north aisle. The aisles are divided by a row of pillars with Renaissance caps, supporting pointed arches. Both aisles are lighted by square-headed windows with cinque-foil lights. The details of the masonry are almost entirely Gothic. The woodwork, on the other hand, is Jacobean. At the east end of the church are two chapels separated from the aisles by a Jacobean screen. The on the north side of the church is used as the chance the southern one is the Harrison chapel. The aisl roofed by large tie-beam trusses and the ceiling is divid into squares formed by the purlins and principal ra which squares are filled with ornamental plaster decor The iron bracket shown in the illustration is used t port the mace, and is fixed to one of the pews nea pulpit.

rick rather than with any other of the aggregates tested: t should be noted that the tests for adhesion were made vith Dorking grey-stone lime only, and, in view of the esults obtained from the fuller series of experiments for ensile and crushing strength of ordinary mortars, it is ossible that different results might have been obtained vith other limes. It is also worthy of notice that with ortar of Dorking grey-stone lime and either pit sand, hames sand, or ground brick the mortar broke in itself nstead of leaving the surface of the brick, so that the est might be supposed to have become really one of the ensile strength of the mortar, but that the figures for dhesion are considerably higher than those for the tensile trength of the same mortar tested in briquettes.

An interesting section of Mr. Dibdin's report is that ealing with the effect of trass as an element in the com-osition of mortar, and the results are given of tests made y various investigators in Germany and by Mr. William halloner in England.

The report gives in detail a large amount of informa-on as the result of 1,776 experiments, all of which are abulated and illustrated by diagrams, so that we have ere a classic work on the strength and composition of ortars.

NOTES AND COMMENTS.

The Vicar of Bardney, Lincolnshire, in a letter to e *Times* appealing for the sum of £350 for repayment f money lent for the purchase of the site of Bardney bbey, gives the following particulars of the results of xcavations already made, which we regret to learn from e same source is now ceasing for want of funds: It is well known to a great number of people that xtensive excavations have been going on now for two nd a half years, with remarkable results. We have just nished the whole area of the church, which is 260 ft. ng, 61 ft. broad, and 130 ft. across the transepts; the xcavating has disclosed considerable remains of 30 illars, two altar slabs, and 80 monumental slabs of nusual interest *in situ*, 54 of which have inscriptions ating from Abbot Roger de Barowe, 1352, to William otheray, Sub-Prior, 1525. The refectory contains not nly the stumps of the table legs, but also the triangular-haped trestles (with carved heads) that carried the tables; e dorter, reredorter, chapter-house, kitchen, and well re full of interest."

Mr. Raymond Unwin, in his inaugural address as ecturer on town-planning at Birmingham University, vell defined town-planning as a co-operative art which an only be successfully carried out on a large scale by e cordial co-operation of many experts. The archi-ect, the surveyor, the engineer, the valuer, the economist, e sociologist, and even the antiquarian must all con-ribute their experience and their skill. Some of them ust decide absolutely the limits within which the design ust be worked out; and each of them in future must nderstand the bearing of his own branch upon town-lanning as part of his equipment. He hoped that this ourse of lectures might be helpful to many who would be rought in touch with the work in this way, but who might ever intend actually themselves to design town plans. ome, however, will in this narrower sense seek to become own-planners. What should be the qualifications of uch a one? He cannot expect to become an expert in all e subjects touched upon; but he must at least know nough of each to be able to co-operate intelligently with hose who are experts, and to assign to the contribution f each its proper place in the whole. With respect to e object and purpose of town-planning he explained hat during the last century the town has become a unit f increasing importance in the national life, and one of e greatest tasks of the present day is to transform the morphous aggregations of population which by courtesy e call towns into genuine communities, the expression f whose highly-organised social life shall be worthy f the honourable title of city. There is need in our city fe of the same guiding oversight and direction in developing the opportunities which its position affords, the same correlation of all the different parts, as are found so essential for a great modern industrial concern. Town-planning is simply the medium through which this organising movement finds its practical expression; the means which will enable each community to foster the growth and efficiency of those industries upon which its prosperity depends, by providing for their expansion in those districts where they will have the greatest convenience of rail and water carriage, power, heat, and light, in close touch with the many subsidiary requirements which facilitate their work. Through town-planning the community can provide for the most convenient communication by rail, road, or car between the industrial regions, the great centres of wholesale and retail exchange, and the various residential districts. Through its means the most healthy and attractive areas can be reserved for residential purposes and their proper development having regard to health, convenience, and amenity can be secured; through its agency also provision for recreation can be made by the proper distribution of playgrounds, parks, and open spaces. It is difficult to exaggerate the direct economy, increased efficiency, and improved opportunities of life which the organisation of towns may lead to, and the impetus which may thereby be given to the development of a race of healthy and energetic citizens.

The proposed abandonment of a Government Central Department of Archæology in India would be nothing less than a misfortune, and we are in full accord with the following letter which has been addressed by the Committee of the India Society to the Secretary of State for India:—

October 7, 1911.

To the Under Secretary of State for India.

Sir,—I have been directed by the Executive Committee of the India Society, at a meeting held on October 6, Mr. Walter Crane in the chair, to express to the Secretary of State for India their earnest hope that the proposals attributed to the Government of India for abolishing the Central Department of Archæology in that country may not receive his sanction.

The committee have heard with dismay of this project. The recent and very fruitful efforts which have been made by the British Government to meet its responsibilities as the custodian of the ancient treasures of Indian art and architecture form, by universal consent among those qualified to judge, one of the brightest features in modern Indian administration. The committee feel sure that the threatened abdication of the central authority in this Department would be widely felt as a heavy blow to artistic and archæological study in the East. They are aware that the complete cessation of the work is not contemplated, but rather its decentralisation. It is, they understand, proposed to leave it in future to the local administrations. These administrations, however, proved notoriously unequal to this trust when it was in their hands prior to 1902; nor, in the nature of things, can any better results be expected of them now. The abolition of the Central Department under the control of the Government of India would probably result in the work for which the Department is now responsible being done at haphazard, mostly by ill-qualified hands. It would certainly mean the abandonment of all hope of training up an efficient school of Indian archæology. It would leave foreign institutions, such as the archæological wing of the admirable "Ecole Française" at Hanoi, the accomplishment, under far greater difficulties, of the studies and researches which have already, since the establishment of the Indian Archæological Department nine years ago, won so much credit for British scholarship and for the Government which supported it. The mere cessation of the annual reports of the Department would be felt as a serious loss to science, to history, and to art.

The justification of the proposed measure of decentralisation is apparently to be sought for in motives of economy, although the British Government in general is well known to spend less on objects of this description than do other civilised nations. In this connection the committee would point out that under present conditions there is at the disposal of the Central Government a qualified expert in every branch of Indian archæology. Unless the Provincial Governments were each in possession of a similar staff—an arrangement which certainly would not make for economy—the necessary work could not possibly be carried out with any approach to the present standard of efficiency. It is clear, therefore, that under the new conditions the work must either be done much more expensively or much worse. There is every reason to fear that both these unfortunate results may be realised—more money, in the aggregate, will be spent than at present, and most of it will be misapplied and wasted.

The Committee of the India Society would, therefore, most respectfully but earnestly urge upon the Secretary of State the importance of maintaining the Indian Archæological Department upon the same lines as at present—lines upon which its value and efficiency have already been abundantly proved. The committee consider that the abolition of the Department would be a calamity which would be deeply felt, not in India alone, but wherever the results of archæological discovery and the preservation of the memorials of a great historic civilisation are valued and understood.

I have the honour to remain, Sir, your obedient servant,

T. W. Rolleston, Hon. Secretary,
India Society, London.

In this month's issue of *The Connoisseur* is included a short descriptive article with several illustrations of carved miserere seats in Exeter Cathedral. Dr. Wm. A. Shaw contributes an interesting article on "An Early English pre-Holbein School of Portraiture" and a number of coloured plates are given, illustrating the work of the school. A special feature is made of the work of Josef Israels, reproductions of which in monochrome are included. Illustrations and descriptions are given of the two pre-Reformation chalices that remain in Lancashire, the Hornby and the Clayton examples. A coloured plate of the Mona Lisa picture forms the frontispiece of the number. Brass amulets as worn by cart horses is the subject of an article by E. V. Alison, illustrated by examples from the writer's collection of two hundred specimens.

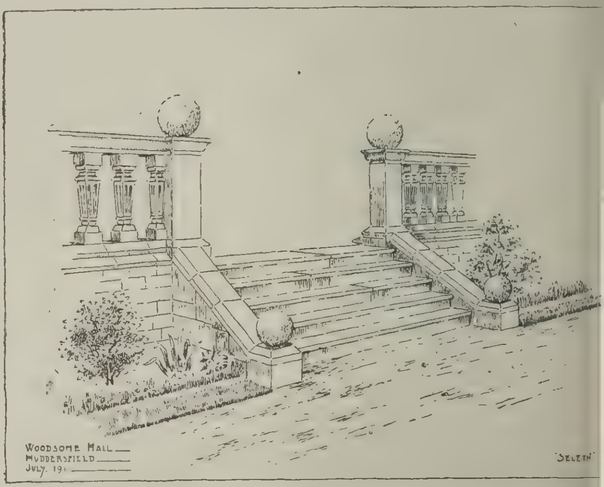
It could scarcely be expected that modern ideas of town-planning would escape opposition, and an example of such opposition comes from East Birmingham, where in consequence of the Town Planning Sub-committee of the Birmingham City Council having refused to pass plans for the erection of more than ten houses to the acre in the Ward End district, a public meeting was held to protest against what was declared to be a harsh and unpractical interpretation of the Act and conditions which would prove detrimental to the welfare of the working classes. At this meeting after some strong protests against the policy of the Council, which it was stated would prevent the erection of houses of 6*s.* 9*d.* a week rent and limit building to houses of 10*s.* to 12*s.* a week the following resolution was passed by a large majority:—"That this meeting of the ratepayers and householders of East Birmingham protests against the manner in which the Town-planning Act is being put into operation. It considers that the intentions of the Act are being exceeded and violated, and that the restriction of ten houses to the acre, which it is sought to impose upon builders, is impracticable and unnecessary, and will prevent the erection of weekly houses at rents which working men can afford to pay. It considers that, while it is desirable to lay out new districts on town-planning lines, the proposed restrictions should be modified to enable suitable houses to be built for working people. It trusts arrangements will be made so that building operations may proceed, and thus prevent a large number of workmen being thrown out of employment this winter. It directs that a copy of this resolution shall be sent to the Lord Mayor and the Secretary to the Local Government Board'

"THE ARCHITECT" STUDENTS' SKETCHIN
AND MEASURING CLUB,

THIS drawing shows a fine example of a flight of ste
with the accompanying balustrade leading from t
lawns up to the paved forecourt of a fine old hall of t
Renaissance period in Yorkshire.

The terrace behind this balustrade commands a magn
cent panorama view over an extensive valley—the hall sta
ing on a hill near Huddersfield.

The proportions of this piece of seventeenth century wo
manship are such as to prove valuable to any similar p
tion, and are notable for grace of outline and solidarity
construction. The steps are easy "going," and quite pla
with a simple rounded nosing, and the balustrade is c
posed of double-splayed coping to the retaining wall, a



square moulded and fluted balusters supporting anot
coping, with a bold "cyma" moulding—the bottom fille
which is plumb with the face of the square pillar. The pil
are capped with massive stone balls 17 inches diame
The width of the coping forms an excellent leaning r
being 15 inches wide and of an easy and suitable height a
the court. This flight of steps is placed axially with
main entrance porch of the building.

Woodsome is situated in the well-known stone distric
Huddersfield, and this stone-work has suffered very li
indeed from the ravages of time, as it is still in excel
preservation.

SCHOOL OF ART WOOD-CARVING.

THE prospectus of this School for the coming ses
has just been issued, and gives particulars of
classes, which are held during the day from 9.30 A.M
1 P.M. and from 2 to 5 P.M. on five days in the week,
from 9.30 A.M. to 1 P.M. on Saturdays. Evening cla
are held on Monday, Thursday, and Friday from
to 9.30 P.M., and on Saturday afternoons from 2 to 5
Fees vary according to the time that students wish
attend, which may be for one day or one evening up to
whole time the School is open. Included in
prospectus are some excellent notes for students by
Walter Crane, R.W.S., Mr. A. S. Cope, R.A., and
William Emerson, F.R.I.B.A., which are of gen
interest, and which we reprint as follows:—

THE TREATMENT OF PLANT FORM AND FIGU
IN WOOD-CARVING.

The treatment of plant form has an important bea
upon the wood-carver's art, seeing that it relies la
upon foliated forms, leaves, and flowers, for its prin
enrichment. The degree of formality in the treatmen
plant form in carving must, of course, depend largely
the nature of the work, its general style, and the relati
parts to the whole. The conditions of the work may a
of a near approach to nature in some cases, while in oth
strict convention and formalism may be necessary.

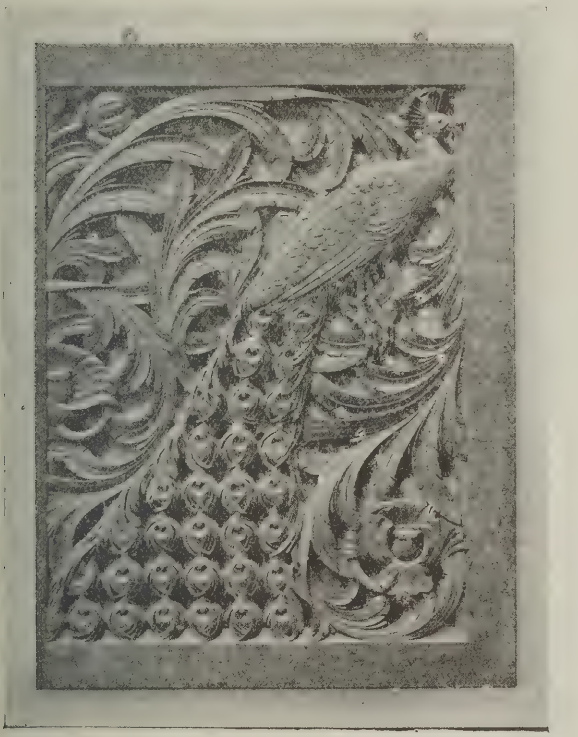
When, however, natural forms are used and it is an o
to represent definitely, but in an ornamental way,
known plant, regard should be had to its essential chara
and the law of its growth, and no attempt should be m
under the false idea of making it more graceful or decora
to conventionalise it out of all resemblance to itself.

oak, for instance, should not be made to follow the lines of the clinging vine, or a rigid plant of vertical habit treated as if it were a creeper. A certain convention or formalisation is always necessary in using natural forms in decorative design of any kind, but there is good and bad convention.

Planes of relief, light and shade, and texture being the chief means of expression in carving, much depends upon the feeling and taste with which these resources are utilised so as to give appropriate contrasts of surface, while the entire design should be in keeping with the construction and use of the object it is intended to adorn.

These latter considerations should really determine the appropriate treatment, also the choice of type of design; but, of course, it is possible to treat one object, say, a cabinet, in a variety of different ways. If a rich and intricate effect is sought for one would select a small crisp kind of foliation and make use of the contrast of smooth surfaced leaf and spherical berries, such as a treatment of the holly might afford (for the panels), while the flat styles and enclosing linear mouldings would give the necessary repose and opposition. For broad, smooth, and rather flat effect, leafage of the type of the laurel would be appropriate.

For finials, crockets, or crestings, for suggestions both in design and carved treatment, a study of the leaf-buds and shoots of trees is recommended, such as the chestnut and the sycamore, which in the various stages of their opening in the spring show most beautiful and delicate structure and form. Students are strongly recommended to keep note-books and to make drawings of such things whenever opportunity occurs.



Dead leaves, too, are full of beautiful curves, especially oak leaves that have dried and hung on the tree in some sheltered place all the winter.

The lines and spiral curves of wood-shavings, or of strips of thin paper which has been rolled, are useful to study for fresh suggestions in the treatment of scroll-forms so useful in carving, and for the treatment of heraldic mantling and Lambrequin.

Heraldic forms are indeed pre-eminently adapted for treatment in wood-carving, and a study of heraldry in its fine periods is strongly recommended to wood-carvers. Mediæval examples, English work of the thirteenth and fourteenth centuries, or early German Renaissance, such as may be found in The Triumphs of Maximilian by Burgkmair, or the fine work of Albert Dürer are the best.

This suggests a word in regard to the carving of animals and the human figure. In good heraldic examples, again, will be found excellent suggestions for the treatment of animal forms in ornament, one important principle to observe being the rhythmic arrangement of the main lines and limbs in action, and also the controlling influence of an unseen boundary, within which your animal or figure should be designed—square, parallelogram, circle, or oval—which last will probably be the most generally useful.

In the treatment of figures in wood-carving, drapery is always a very important element, as being one of the chief means of giving richness and colour to a design. Well-designed drapery also helps to express the movement and life of figures, besides giving broad planes or rich folds to contrast with the smooth and delicate modelling of the faces and finer details of the hair or costume and accessories.

German carved altar pieces of the fifteenth century, such as may be found in the Victoria and Albert Museum, may be studied with advantage for the treatment of figures; as also some of the interesting miserere seats and stall work in our English churches and cathedrals, which are full of vitality.

Walter Crane.

A PLEA FOR MORE ADVANCED TRAINING.

The School of Art Wood-carving having succeeded by admirable instruction in attaining for its students a high percentage of practical efficiency in the actual craft of carving, the time has most certainly arrived for giving the advanced students an opportunity of making themselves better acquainted with the characteristics of the different styles of decorative design, that have attained a high place in the history of art.

The importance of this, in the opinion, I think, of every practical artist, cannot be over-estimated, as without it a student is launched on an unknown sea without charts or experience, and left with but the remotest chance of arriving at any desirable destination.

I have heard propounded a theory that to omit all study of the past is the best method of developing genius and originality in the future! One might as reasonably expect a fine opera from one ignorant of the laws of harmony, or for a young recruit to conduct a successful campaign, without even a study of the methods of the great generals. Originality is the development of individual feeling grafted into the tree of knowledge—knowledge of what has been done by great designers, and fortified by a thorough acquaintance with the main principles of beauty and of proportion.

We must also bear in mind that originality is not only a rare plant, but that where it does exist it will blossom unaided, and all the sooner and better for a thorough and humble study of the best work done in the past; while the many who have not that particular gift are greatly handicapped in obtaining remunerative employment unless they are competent, on demand, to execute work in harmony with the style required.

It is obviously impossible for any one either to design, restore, or even copy *accurately*, a piece of work distinct in style, such as the subtle curves in Louis XV. designs, unless thoroughly conversant with that period, and I would therefore strongly urge the desirability of taking steps to assist and encourage students to complete their practical training by mastering in turn the main principles of Gothic, English, Italian, French, and Spanish carving, and then to specialise in the particular period that most appeals to their own individual taste and feeling.

In this way—and in this way only—will they be able to attain a higher state of efficiency, and so enable them to compete successfully with the carvers of France and Italy, and raise the whole standard of wood-carving in this country.

A. S. Cope.

THE RELATION OF CARVING TO ARCHITECTURE.

To one who proposes to take up carving as his life's work, the study of architecture in all its styles is invaluable, and, indeed, necessary, as carving in practically all its branches has some definite relation to architecture. Carving, like all the applied arts, is a handmaiden of architecture—the mother of all the arts, and should therefore be subject to it, not the dominant note.

It should enhance the beauty of the architecture, but should not be the principal thing that strikes the eye, either by its peculiarity or its scale.

This is the fault of a good deal of our late building, the dominant effect being an exuberance of much unnecessary carving, and often out of scale.

The general effect of the beautiful in nature, whether on a large scale—as in mountains and hills, or on a small scale, as in trees or flowers—first attracts the attention, and is always reposeful, then examination discloses the wonders of the details.

The study of architecture is needful to the carver, so that his work shall be in harmony with the style he is adorning; he will then not insert natural or Gothic foliage where conventional or Classic forms are needed, or *vice-versâ*. And it must be borne in mind that if art is "Man's delight in God's work," it is not by copying natural forms exactly that this is expressed, but rather by deducing therefrom by his own invention conventional renderings of them. Even the later mediævalists, notwithstanding their free introduction of natural foliage forms, nevertheless conventionalised exceedingly cleverly both in their wood and stone representations.

Obviously the styles of architecture must be studied by the carver; it would be inharmonious to introduce fifteenth century detail into thirteenth century work, or free Renaissance carving into a severe Classic building; therefore, to work harmoniously with the surroundings a complete knowledge of the differences in styles and a facility in working in them is absolutely essential. The study therefore must include learning the details and forms applicable to the various styles.

The scale of the work to which carving has to be applied has also to be most carefully considered.

William Emerson.

THE USHER HALL.

Since the memorial-stones at the Usher Hall were laid by the King and Queen on July 19 last great progress has been made with the works by the contractors, Messrs. Neil M'Leod & Son, Edinburgh. For this the beautiful summer weather enjoyed since then, which has enabled building operations to be proceeded with without a break, is in part responsible, but it has been the desire of the builders themselves to push on this important contract with as much despatch as possible. The contractors have on the job, according to the *Scotsman*, at present about 150 masons and labourers, including thirty or forty men at their yard, Harrison Road, who are engaged in preparing the stones, which are sent thence to Lothian Road, carefully numbered and ready to be placed in position. After the great ceremonial of July the contractors had about a fortnight's work in clearing away the grand-stands, and about three weeks more in re-erecting their cranes and getting the area ready for work. At that time nothing more than the foundations of the external walls had been put in; now the walls on all sides are up to a height of about twenty feet, or to a level of what will be the grand circle tier of seats. One can, in these circumstances, form now a very good idea of the appropriate character of the architect's design for the configuration of the site, of the handsome internal proportions which the hall will possess, and of the dignified character of the façade.

The base course of the building is of grey Aberdeen granite from Kemnay quarry. The blocks are finely axed or "nidged." The course itself, owing to the difference of the levels, varies in height from about eight feet or thereabouts on the north side to about one or two feet at its east end in Grindlay Street. Above this the walls are being built of a fine warm cream-coloured sandstone from Darney, Northumberland, specially selected for its weathering quality. The style of construction is what is known as channelled or rusticated ashlar. The walls are from five feet to two feet in thickness, according to the weight they have to carry; and externally at and about the principal entrance front they are embellished with handsome piers, which will rise to a height of about 22 feet. The main entrance doorways in Grindlay Street and Cambridge Street are flanked by double piers of this description. It is interesting to know that the memorial stones, with their fine Roman-letter inscriptions in the style of Trajan's column, which were laid by the King and Queen, will be exposed one on each side of the principal entrance. They are in grey granite, and in this prominent position will always be a reminder of the Royal ceremonial with which the building of the hall was inaugurated. Inside, the workmen are engaged in making a wide and deep horseshoe tunnel—following the shape of the hall and indicating the line of the main corridor—in which will be laid the main piping for all requirements. It also forms the main extraction duct for ventilating purposes. At the east end there is a large and deep excavation for the boiler-house and for a storehouse for chairs. These basement chambers will both be under the platform and area flooring. It may be noted that in connection with this excavation a solid seam of hard blue rock was met with, which had to be blasted to a depth of six feet. Igneous in character, the stone has been quite useful for building purposes. The stones of the school and of the buildings which were demolished to make way for the hall were found of good quality, and after being redressed have been largely used in the construction of the internal walls of the hall. In the excavation the workmen passed through boulder clay and blaize to solid rock; and for the most part the building is being reared on a rock foundation. Cambridge Street Lane has been widened by about ten feet, and will give access to the gallery and to the rooms of the artists, which are to be situated at the north-east end of the building. A considerable area has been thrown into the street in the angle between the Usher Hall and the Gaelic U.F. Church. In an open area between the east end of the hall and the Lyceum Theatre there is at present in course of construction a brick chimney stalk to carry off the smoke of the boiler fires. Its total height will be about 85 feet, and it is now 50 feet up. A large part of the west gable of the Lyceum Theatre has been underpinned in connection with the excavations at this end of the hall; and there will be a solid stone wall between part of the theatre gable and the hall. In addition to steam and hand cranes there are three huge cranes in the hall area at present at work in the lifting of stones and material. Two of them are worked by electric motors, the power supplied from the city mains. They can lift a weight up to three tons, and they have the advantage over the old steam cranes that they are easier to manipulate and do not send forth smoke.

THE WESTERN TOWERS OF GLASGOW CATHEDRAL.

Until the middle of last century, or, to be more precise, until the year 1846, Glasgow Cathedral possessed two western towers which projected beyond the present front in a manner resembling the remaining north-west tower at the chapel of Holyrood, Edinburgh. These towers, which had weathered the storm of the Reformation, and been repaired by the Town Council of Glasgow at their own expense, were foolishly removed—the south-western in 1846 and the north-western in 1848. As the late Archbishop Eyre said, "All who now see the grand old building, shorn of its cathedral feature and made like a large parish church, mock and laugh at the action of the local committee, saying, 'These men had two towers, and they went and pulled them both down!'" One of the reasons alleged for their removal was that they were not of sufficient antiquity; yet even at this time it was admitted by Archibald McLellan that at least one of them dated from the 13th century.

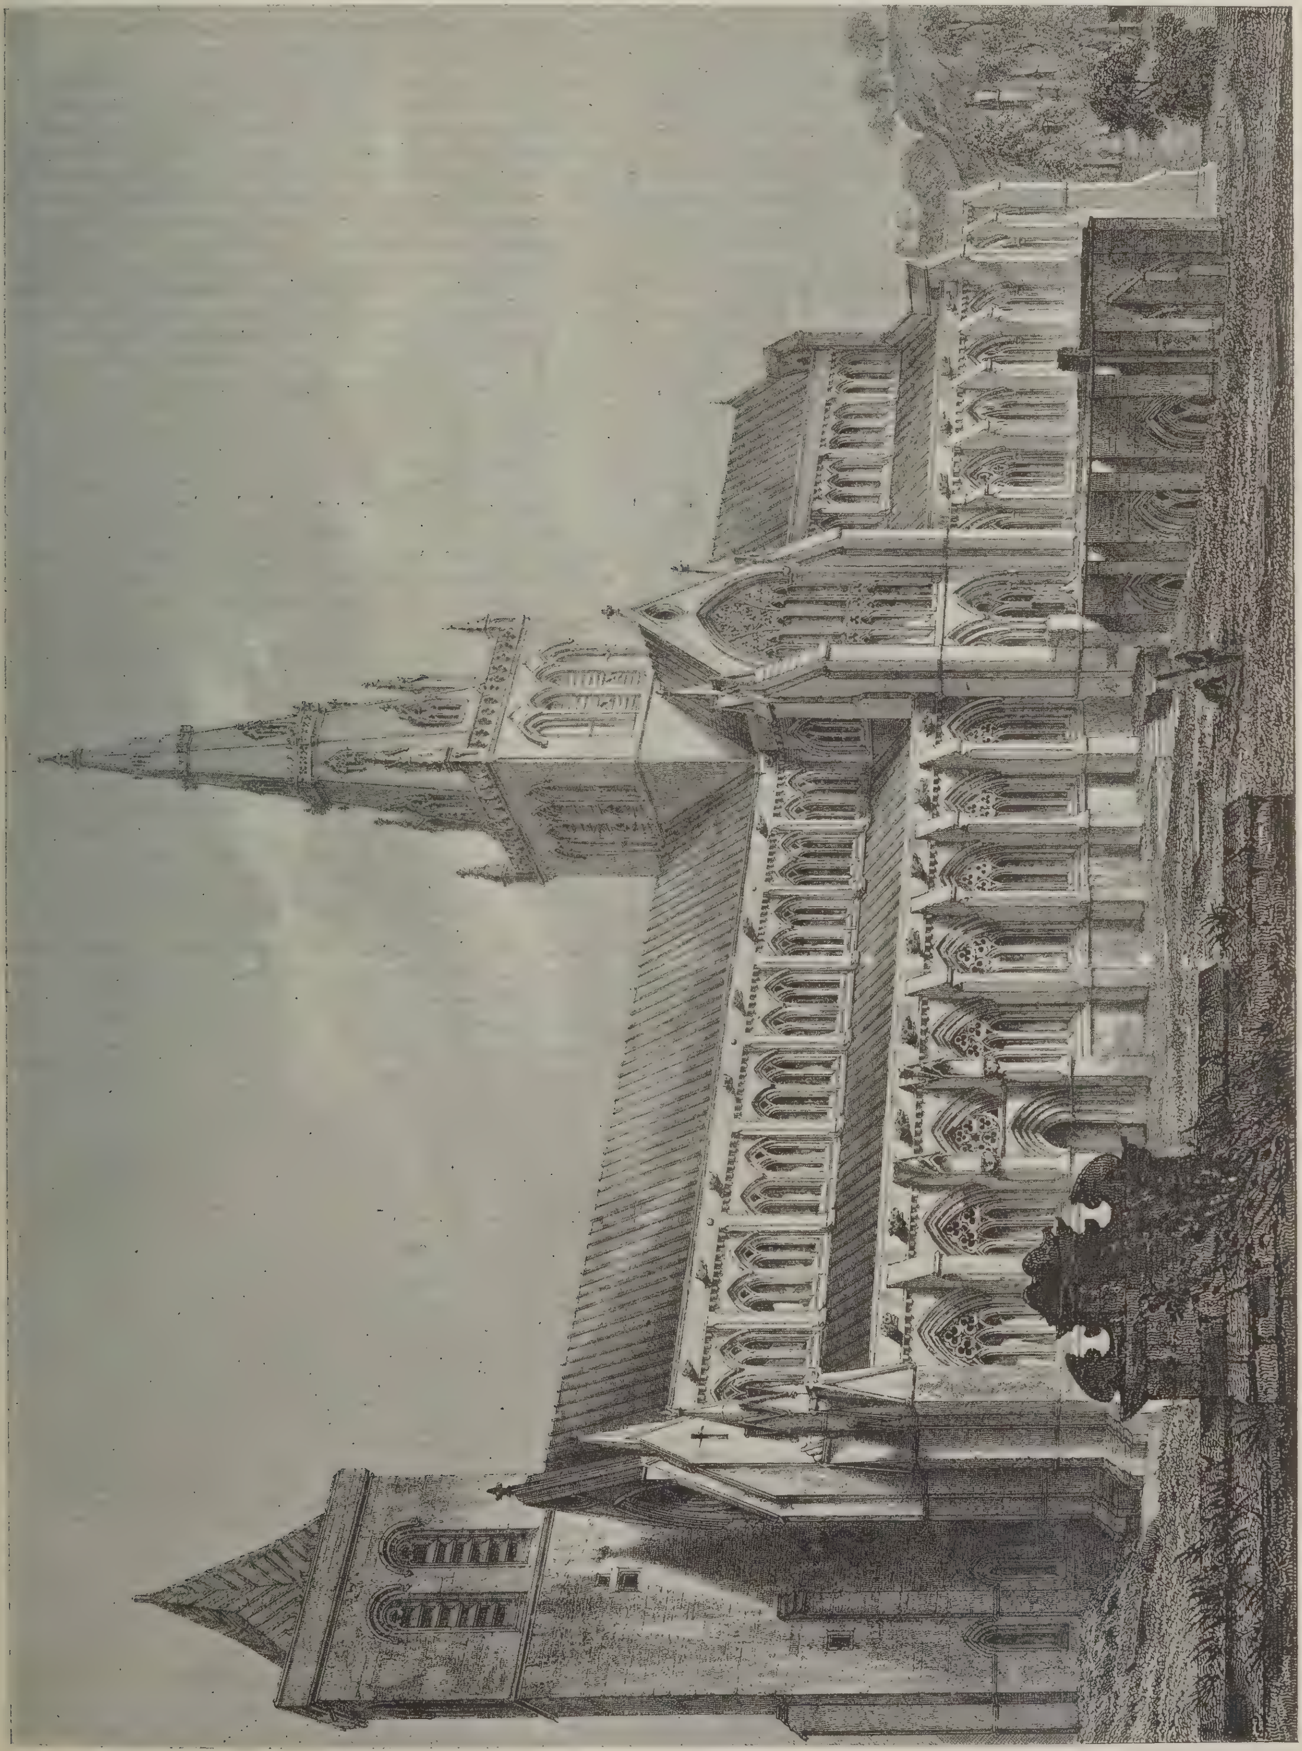
Several views of the cathedral with its western towers have been preserved, and careful measured drawings of these towers are included in James Collie's book of geometrical drawings of the cathedral, published in 1835. In addition to these, a drawing by Billings, in his "Baronial Antiquities," shows a magnificent view, dated 1847, of the cathedral from the south-west, with the north-west tower still standing, but with the south-west tower removed. It supplies just the note which is required to give the group the dignity of a cathedral, to make the west front worthy of the seat of an archbishop and of the unrivalled Lower Church. Since the removal of the western towers the best point from which to view the cathedral is from the north or south-east, from which points the lack of the western towers is not felt, and the full height of the double church is seen to best advantage. Viewed from the north and south now, the long ridge line of the nave terminates very tamely to the west, where, in the cathedrals of France, and many of those of Germany and England, magnificent towers are situated. In the case of the French cathedrals, these dominated the whole design, but at Glasgow, and, indeed, most of the British cathedrals they were meant to be subservient to the central tower.

Of the other Scottish cathedrals, Elgin, Aberdeen, and Brechin still retain their western towers, and in the case of Brechin, as at Glasgow, they are far from being duplicate towers. The north tower projects beyond the west front, and no one would now think of removing the other tower because it is not square like its fellow, but is one of the very few round towers remaining in Scotland.

The north-west tower at Glasgow was 32 feet square, with walls 5 feet 6 inches thick, rising to a height of 118 feet to the parapet, and to a total of 144 feet to the top of the lead covered roof. One buttress projected from each side, and served to support the stone vaulting inside. Besides the clock it carried two large bells, the gift of Archbishop Dunbar. Under date May 15, 1624, sixty years after the Reformation, we read that "The Provost, Bailies and Council ordain that the laich steeple of the cathedral be theiked with lead."

The south-west tower was much lower, and, indeed, hardly merited the name of a tower at all. It somewhat resembled the chapter-house and sacristy which project from the north east angle of the building, and was used as the library and consistory house, where the bishops held their ecclesiastica courts. It is evident from its thinner walls that it was never meant to be carried to the same height as the other tower. It measured 25 feet by 22 feet inside, and was 54 feet high to the wall-head. The roof was finished against crow-stepped gables, and the buttresses were arranged differently from those of the north tower. There was a large spiral staircase at the south-east angle. A minute dated April 5, 1628, states that the Provost, Bailies and Council have arranged and agreed that James Colquhoun, wright, and John Boyd, mason, build and repair the decayed parts of the library house of the cathedral, put the roof thereon, "geist and loft the same, and theik the same with lead, and do all things necessary thereto for 3,100 merks."

Perhaps one of the most interesting incidents relating to the cathedral is that which records how the patriotic Bishop Robert Wisehart, who, it is known, was at work on the west front of the cathedral, received a grant of timber from the forest of Luss for the erection of a bell-tower and treasury (*campanile et thesauraria*). But Edward I. of England complained in 1291 that instead of using the timber for his



GLASGOW CATHEDRAL—SOUTH-WEST VIEW. From Billings's *Baronial and Ecclesiastical Antiquities of Scotland*, by permission of the publisher, T. N. Foulis.

clock tower (*clocher*), the bishop had employed it to construct engines of war against the English garrisons of Scottish castles, especially the castle of "Kirkintolach." Mr. P. Macgregor Chalmers pointed out some years ago that this referred to the north-west tower, which, till its destruction, was the clock tower.

Early in the 15th century this tower was injured, and Bishop Lauder, who also built the parapet at least of the central tower, restored the north-west tower. No doubt the three beautiful corbels, with human figures bearing scrolls, which lie now in the chapter-house, are of this period. They are referred to by Dr. Wilson in the unavailing petition against the removal of the north-western tower as supporting the rich groining. He added that the removal of this tower "for the purpose of restoring the west front to a uniformity but poorly repays the idea of size and elevation formerly conveyed by the contrast between the central and west towers."

"Both buildings," Macgeorge remarked, "apart from their antiquity, were valuable as adding greatly to the beauty of the cathedral, and the tower was really essential to the proper balance of the structure; yet, incredible as it may appear, these two interesting and important parts of the cathedral, both at the time in the most perfect state of preservation, were pulled down by order of Her Majesty's First Commissioner of Works, in the course of certain operations professing to have for their object the improvement and restoration of the cathedral!"

Their removal is now admitted by all to have been a great error. Is it, then, too much to hope that the day may yet come when Glasgow citizens will honour themselves and their cathedral, of which they may well be proud, by rebuilding the western towers?

In the course of the recent restoration of the roof of Glasgow Cathedral, which has just been completed, the removal of the 14th century roof of the nave has revealed what was hidden between the plaster vaulted ceiling and the lead of the outer roof, about five feet of wall at the north end of the west gable, a corner, all that is left of the north-west tower, the bell tower of the patriotic Bishop Robert Wisehart.

THE FOREIGN RELATIONS AND INFLUENCE OF THE EGYPTIANS UNDER THE ANCIENT EMPIRE.

A COMMUNICATION presented to the British Association at the Portsmouth meeting, 1911. By G. Elliot Smith, M.A., M.D., F.R.S.

IN a previous communication attention was called to the fact that the population of Lower Egypt had received a strong infusion of alien blood before the time of the earliest Pyramid-builders. During the past year much more precise evidence has been obtained concerning these foreigners in Egypt and the distribution of their kinsmen beyond its frontiers; and in the process of following these people in Western Asia and North Africa much information has been obtained, which seems to be complementary to that obtained by historical research in Europe and a solvent of many of the apparently insuperable difficulties that have beset archæologists working in the Mediterranean area.

The aliens who mingled with the Proto-Egyptians in the early centuries of the third millennium B.C. were in large part the kinsmen of the people variously called "Armenoid," "Alpine," "Celtic," &c., who are said to have introduced the culture of the Bronze Age into Europe. Thus the early history of Europe is brought into co-relation with the great events that ended the Age of Stone in Europe and Western Asia.

The people of Upper Egypt discovered copper in Early Predynastic times, and during the succeeding centuries slowly learned to appreciate the magnitude of their discovery. In Late Predynastic times they were casting formidable metal weapons, which enabled them to unite the whole of Egypt under their sway. They pushed their way beyond the frontiers of Egypt, as they tell us in their own records—to Sinai for copper-ore, and to Syria for cedar from the Lebanons, as well as to the south—and they met and intermingled with the Armenoid population of Northern Syria, who acquired from them the knowledge of copper and its uses, while the Egyptians themselves took back into Egypt in their own persons ample evidence of the existence of an Armenoid population in Syria before 2800 B.C.

Before this time the Armenoids had been trickling into Neolithic Europe, without, however, making much impression upon the customs or the physical traits of its population; but once they had acquired metal weapons from the Egyptians they were able to make their way into Europe by force and to impose their customs upon her people, in virtue both of their numerical strength and the power they wielded from being better armed.

In Egypt itself the Proto-Egyptians in Predynastic times had learned to make not only weapons of war but also tools of copper. The skill they acquired in using these tools made them expert carpenters and stonemasons; and during the early dynasties they ran riot in stone, creating the vastest monuments that the world has ever seen. The knowledge of these achievements spread amongst the kindred peoples on the southern shores of the Mediterranean, to the neighbouring isles, and to Southern Italy and the Iberian Peninsula. But it was the knowledge of the various kinds of monuments that the Egyptians were building and not the skill nor the skilled workmen that spread: at the time of the Sixth Dynasty or thereabouts the fashion of building stone monuments, dolmens, menhirs, cromlechs, rock-cut tombs, &c., began to spread amongst the kindred peoples, not only on the west but also on the east of Egypt.

The evidence afforded by the excavations of Orsi and others in Sicily and Southern Italy seems to indicate beyond any doubt that Egypt was the source of the new burial customs that came into vogue in the Æneolithic Period. The features that seem so hopelessly inexplicable to the Italian archæologists are precisely those which the Egyptian evidence elucidates.

The absence of megaliths and kindred monuments in the track of the main Armenoid stream of immigration from Asia Minor into Europe is valuable negative evidence. The Armenoids of Asia Minor acquired a knowledge of copper weapons by contact with the Egyptians on the battlefields of Northern Syria; but they knew nothing (at the remote date we are considering) of stone-working or of megalithic monuments because they had no personal knowledge of Egypt.

ILLUSTRATIONS.

OXFORD CATHEDRAL.

THE Cathedral Church of Christ, properly called, originally the church of the Priory of St. Frideswide, is directly connected with the earliest recorded history of Oxford, dating back to Saxon days. The building consists of a choir of five bays with aisles, and on the north side two chapels of four bays, and on the south one chapel; a central tower and spire, nave of four bays with aisles, a large vaulted western entrance, a north transept with western aisle of three bays, and a south transept communicating with the cloisters. The chapter house is entered by a fine Norman doorway, of the supposed date of 1180. The upper portion of the tower, with the addition of the spire, was built at the beginning of the thirteenth century, together with St. Frideswide's Chapel; whilst in the fourteenth century the Latin Chapel was added. This drawing was one of those by "Plato" which received a prize in *The Architect* Students' Sketching and Measuring Club.

MAGDALEN COLLEGE, OXFORD.

ANTONY WOOD says "Magdalen is the most noble and rich structure in the learned world." It was founded by Wm. Patten of Waynflete, who in 1457 secured the site of the old Hospital of St. John the Baptist, and this is supposed to have been the original foundation. This drawing was one of those by "Plato" which was awarded a prize in *The Architect* Students' Sketching and Measuring Club.

IEW OF CLOISTER, DODFORD CHURCH.

THIS drawing, by Mr. Arthur Bartlett, F.R.I.B.A., was exhibited at the Royal Academy this year, and supplements the series of views of Dodford Church, Worcestershire, given in *The Architect*, January 28, February 11, and March 4, 1910.

HOUSE AT WALLSEND.

WE illustrate some of the unpretentious but artistic domestic work of Mr. Edward Cratney, at Wallsend-on-Tyne.

SIR JOHN SOANE, R.A., F.S.A., &c.*

[T is now some six and a half years since I wrote my original essay upon this subject, and 74½ years have elapsed ince the death of this architect, whose name is so well known ut whose works are as yet little appreciated.

Sir John Soane may be styled as having anticipated the eo-Grec development of to-day. In all his works we find, n close examination, a most scholarly appreciation of the lassical style of architecture in its minutest details. His useum in Lincoln's Inn Fields is a standing evidence of is cosmopolitan feeling for all art, whether it be Gothic r Classic architecture, painting, sculpture, or literature, nd there exists no more compact collection of material for e student to-day.

Genealogically, Sir John Soane is generally accepted to be e grandson of Francis Soan (spelt without the final "e"), the Swan Hotel, Goring, and the youngest son of John oan, of Basildon, a journeyman bricklayer employed on the urch there, who was subsequently drowned while fishing the Thames.

He had four brothers, three of whom died as children, nd three sisters, one of whom died at age twenty-three. he record of those living does not appear to be traced. In 84 he married Elizabeth Smith, niece of Mr. George Wyatt, Albion Place, a wealthy builder, who, dying in 1790, left large sum of money to his niece, which put them in an dependent position financially. By her he had issue four ns, of whom two died within a year of birth. The eldest, ohn, was given an excellent architectural education, but he bsequently went to the North of England, married, and ve up the profession. He had a son John who died at adeira in 1848. Soane's third son, George, married Agnes oaden in 1811, and had two daughters and a son (one ughter dying as late as the year 1897-8). This son was sinherited by his father owing to his becoming a playright. Sir John eventually left the surviving members of s family a legacy.

Young John Soane, the subject of this paper, was born Reading on September 10, 1753, and was educated at r. William Baker's school there.

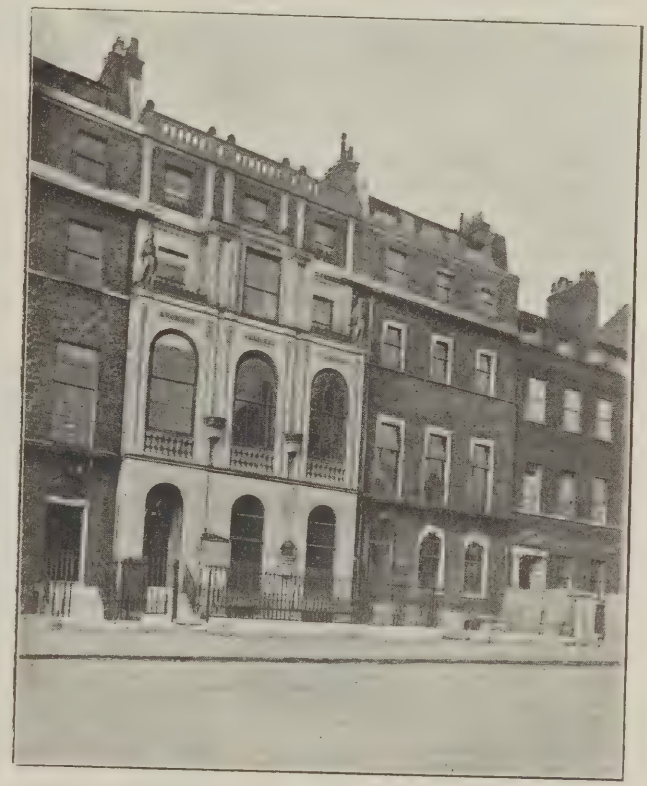
At the age of fifteen he was introduced by a relative to a rveyor named Mr. Peacock, through whose influence he beme employed by George Dance (junior), the architect of ewgate Prison, St. Luke's Lunatic Asylum, &c. He subseently joined Henry Holland, of the firm of Holland, Copnd & Rowles, timber merchants, to gain a practical perience of a more technical nature. This firm built oane Street, Cadogan Place, and Hans Place, old Battera Bridge, old Drury Lane Theatre, the Pavilion at ighton, &c.

At the age of nineteen Soane obtained the Royal Academy lver Medal for a drawing of Whitehall and the Gold Medal his second attempt four years later for a design for a iumphal bridge, which his biographer, Mr. Leverton onaldson, designates "a poet's dream indicative of the vast rtile resources of the mind of the author." Sir William ambers was equally struck by this effort of genius (which a perfectly practical design), and took occasion to introce him to King George III., who nominated him travelling dent for three years at £120 per annum, which was then e Royal prerogative and not, as now, exercised by the ademicians. (These were evidently the palmy days for A. students.)

Sir John Soane, in his "Memoirs," considers this the st fortunate event of his life, as it enabled him to form nnections to which he owed all the advantages he subseently enjoyed. A copy of Sir William Chambers's letter advice to one of his pupils at Rome in 1774 was given him to Soane, in which the following useful sentence urs: "Work in the same quarry with Michel Angelo, gnola, Peruzzi, Palladio; use their materials and search more, and endeavour to unite the grand manner of the st two with the elegance, simplicity, and purity of the t." (Dover House, Whitehall, was more particularly the rk from which, in my opinion, Soane obtained his inspiran.)

In 1777 Soane left for Italy, and at Rome made a design a British Senate House which was subsequently exited at the Royal Academy. He also made a design for royal palace largely based on the Diocletian Palace at alato and other famous Roman buildings, which subject a favourite with him, for in 1821 he exhibited a design at the Royal Academy for a palace proposed to be placed on Constitution Hill, of which a fine perspective was prepared in 1827 for presentation by Lord Farnborough to George IV. His efforts, however, proved abortive, for, as we know, the new palace was not destined to be from his designs.

During his travels Soane visited Paestum, San Lorenzo della Padula, and Calabria before returning to Naples, where he formed the acquaintance of Burdon and others, who engaged him as their draughtsman during a visit to Sicily, Malta, Athens, and Venice. Later he went alone to Verona, Vicenza, and Mantua before returning to Rome. At Rome he appears to have made the acquaintance of the eccentric Lord Bishop of Derry, afterwards Earl of Bristol, for whom he made a number of designs for altering Downhill in Ireland, and measured a temple at Tivoli for reproduction there. He was not, however, treated very liberally by this prelate, who only paid him about £50 for drawings and expenses, which Soane estimated at £400; but he must have made the acquaintance of a number of influential people in Ireland, who doubtless proved useful clients later. The Marquess of Abercorn, for whom he altered Bentley Priory, near Stanmore, and some additions to Barons Court, Ireland, was probably one of these. Soane returned from Italy in 1780 and started practice on his own account in London.



SOANE MUSEUM, LINCOLN'S INN FIELDS.

As to Sir John Soane's personal appearance and disposition, Mr. Donaldson says he was tall and of a graceful figure, with well-proportioned features, having a finely formed aquiline nose, giving a marked character and refined expression to his profile. In his deportment he was extremely dignified, with animated manner, and very prepossessing. In temper, however, he was irritable, impetuous, and untractable. He could not bear contradiction, and took opposition for personal hostility. He was passionately fond of literary pursuits, the collection of artistic relics, and the advancement of architecture. He was elected professor of architecture at the Royal Academy in 1806, and took the greatest pains in preparing and illustrating the lectures with models of temples, &c., which he had made at his own expense; these beautiful little models are still to be seen in his museum.

He was a good linguist, and was elected a member of the Academy of Fine Arts at Parma in 1780, of the Society of Antiquaries in 1795, an Associate of the Royal Academy in the same year, obtaining his diploma as Royal Academician on April 8, 1802, and was made one of the Trustees in 1825. He was elected Grand Superintendent of Works of the United Fraternity of Freemasons in 1813, chosen a Fellow of the Royal Society in 1821, received the honour of knighthood from William IV. on September 21, 1831, and was presented three years later with gold, silver, and bronze medals struck in his honour by the architects of England. In 1835 he received the medal of the Société libre des Beaux-Arts at Paris, and was made an honorary member in the following year. He became a member of the Academy of Fine Arts at Vienna in 1835, and was elected Consigliere Correspondent of the Academy of Fine Arts at Parma in 1836, a year prior to his decease.

---

* A Paper read before the Camera Sketch and Debate Club of Architectural Association on Oct. 5 by Mr. A. E. Bullock.

Sir John was generous and charitable, and gave with a liberal hand to objects requiring pecuniary assistance. As we know, he established the Soane Medallion at the R.I.B.A. and gave that Institute a sum of £750 ; to the Architectural Society he gave £250, and large sums to the Royal British Institution. In addition, he gave a sum of £500 to the Royal Masonic Institution, and £1,000 towards the cost of a statue proposed to be erected in a monopteral temple near the Horse Guards.

Although he disinherited his son George, he bequeathed £20,000 in Consols and Three per Cent. Stock for the benefit of the four children. He left securities and property of the value of £186,000 on his death.

The "e" terminating Soane's name was added shortly after the publication of his first book of designs in 1778, entitled "Designs in Architecture," which is said to have been subsequently bought up by him. He published also a number of other books of his designs, proceedings respecting the law courts, pamphlets, &c.

In order to fully appreciate Soane's position, his advantages, and the difficulties with which he had to contend, it is necessary to briefly review the immediate sequence of architectural careers. His predecessors were Jones, Wren, Hawksmoor, Gibbs, Talman, Kent, Burlington, Vanbrugh, Archer, and Campbell. Those living in his early youth include Ware, Taylor, Dance (senior), the Adam Brothers, Holland, Wyatt, Wood, Chambers (who was twenty-seven years his senior), and Gandon, while his contemporaries were Inwood, Nash, Blore, Wyatt, and Wilkins. His pupils and assistants include the elder Smirke, Basevi, Gandy, Richardson, and Parke, with some eleven others of whom I have traced the careers, and in addition there is a record extant of the names of thirty-six men who have served some time in his office. In the latter period of his life he was associated with Burton, Elmes, Tite, Cockerell, Barry, and Pennethorne. His friends are too numerous to mention except to include the names, *inter alia*, of Britton, Chantry, and Donaldson.

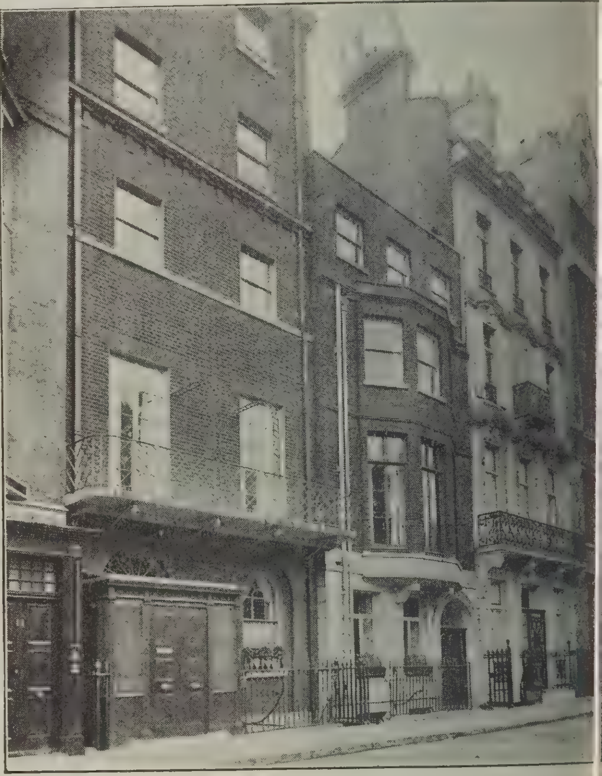
The only book of real architectural research of value extant during the youth of Soane was Stuart's "Athens," which appeared in 1762, while Taylor and Cresy's "Roman Antiquities" was not published until late in his life, and partly through the auspices of one of his own pupils. Moreover, Italy was rarely visited and Greece never, and works on modern edifices of France and Italy were unknown. It will, of course, be argued that there were the buildings of Inigo Jones and Wren and the other of his immediate predecessors in the profession acting the part of silent witnesses of the grand manner ; but it must be remembered that, apart from these works being entirely based on Roman models, it was hardly the spirit of the age in which Soane lived to be satisfied with home influence while the thirst for Hellenic exploration was rife. In view, therefore, of these many disadvantages, he made the most of his travels.

Soane's profound learning is amply exhibited from his frequent allusions to Vitruvius, Alberti, and other writers in the model lectures he gave to the students at the Royal Academy. He was a man of great integrity and uprightness, and was never influenced by sordid motives. He took pride in collecting rare works of art at any cost, marbles and casts from ancient fragments when neither the British Museum nor South Kensington Museums existed, and when casts of architectural detail were unknown. He was well informed upon current art and the progress made in all its branches, and was one of the first to recognise Turner's genius. He either personally attended or commissioned his friend Mr. Britton to purchase for him valuable books at sales of the effects of notable people to replenish his library and make it of the utmost use to the student. It is therefore to this dilettante trait that we must attribute the reason for the appearance of the meretricious ornament with which he loved to adorn his buildings, and which reached a climax in his treatment of his wife's tomb at St. Pancras Churchyard.

In his works we observe three distinct periods of taste, in the first of which he appears to have approached his attempts at design with some timidity ; experience and time subsequently made him bolder and gave greater solidity to his façades, while the final efforts exhibit a desire to creat a new style, independent of the orders with those unfortunat embellishments, which are often mean and meretricious. I is to these latter that some loss of fame is due. Stripped c them, many of his buildings would be dignified and origina The endless number of designs he would make for the trea ment of a feature testify to his restless desire to produce lasting effect. Many of his terminations express great beaut of outline and detail, and where he has used vases in th composition they are always graceful and refined. He wa a master planner in small limits, and in the case of th Bank of England the change of axes of the corridors, &c are often cleverly arranged. His works rarely exceeded th estimated expenditure.

The chief source of information as to the professional li of this architect is obtained from his "Memoirs of an Arch tect" (1835), dedicated to Master John Soane, his grandso copies of which were sent to, some of his personal friend wherein he closes his preface with the remark that "Arch tecture is a coy mistress, only to be won by unweari assiduities and constant attention."

Like Barry, Soane had little patience with Gothic arch tecture, which he considered too expensive for modern use he was nevertheless fond of King's College Chapel, Cambri of which he says "there is a boldness and mathema knowledge peculiar to this edifice which claims our ear attention and admiration." He doubtless had ample op tunity to study this building when considering the prop improvements to Caius College in 1789.



COL. GRAHAM'S HOUSE, 12 STRATTON STREET, PICCADILLY.

I will not weary you with a recital of the many the and deductions he gives in his review of architectural st but will just quote a verse with which he closes his expl tion of the "Elegant Refinements of Grecian Arch ture":—

"Let us hope that
The time not distant far shall come,
When England's tasteful youth no more
Shall wander to Italia's classic shore,
No more to foreign climes shall roam
In search of models better found at home."

From which it would appear that Sir John shared s what of the spirit of Sir Thomas More in looking forwa a perfect millennium in architecture here in England.

A perusal of Soane's life elicits one experience whi not uncommon in modern architectural effort—I allude t chagrin at being premiated yet superseded in compet works. He had this disappointment in connection with designs for the open competition for two Penitentiary H

Battersea Rise, for which he was premiated, yet the ildings in question were carried out by Blackburn and rdwicke.

In 1788 Soane published a book of his designs for houses cted in Norfolk, Suffolk, Yorkshire, Staffordshire, Warkshire, and Hertfordshire. This was not the first of his blications, since he brought out two editions of "Designs Architecture" in 1778 and 1797, which, as I have said, subsequently bought up.

Soane came in contact with Nash on more than one asion, and I am inclined to think there was little love t between them. They were both of an age and practised regards London) practically in the same area, entering same competitions, and there appears to have been keen alry between them.

Nash was born the same year as Soane and died two years ore him; his connection with Blore in carrying out the ks at Buckingham Palace was the last straw—Soane's ef ambition to erect the Royal palace being thus thwarted.

Among the many buildings in London which Sir John ne has designed or altered may be mentioned several ses in St. James's Square, including No. 33 (late Derby use), at the corner of Charles Street, for Lord Eliot; Earl of St. Germans, No. 19 (now No. 21) for the Duke eeds; the Earl of Hardwicke's house, No. 3, and a house Samuel Thornton, Esq. (No. 22). In Pall Mall he t the Marquess of Buckingham's house (No. 92), upon site of which the Carlton Club now stands, also the ntess of Pembroke's residence, No. 49 Grosvenor Square, red in 1802 for the new tenant, Robert Knight, Esq., had a library added, and again in 1818, when the les were built. No. 12 Stratton Street, next to Devone House, was built for Col. Graham, No. 18 (now 22) Park Lane, for Mr. Robins, for whom also he built 172 Regent Street, where Messrs. Robinson & Cleaver are. His own house, No. 12 Lincoln's Inn Fields, he t in 1792, and the Museum next door (No. 13) in 1812.

PICTURE GALLERY, DULWICH COLLEGE.

n the City, apart from the Bank of England, which we deal with in detail later on, he built the National Debt Redemption Life Annuities office in Old Jewry; New k Buildings, Princes Street, which is now pulled down, which I managed to secure a photograph of before the nd half was destroyed; Messrs. Thellusson & Co.'s nises in Meeting House Court, Old Jewry; Messrs. Goote, scott & Co.'s banking house in Threadneedle Street; nises for W. A. Jackson, Esq., in Fountain Court, ermanbury; and a mural tablet erected in St. Stephen's rch, Coleman Street, E.C., to Claude Bosanquet, 1786.

At Westminster he built the New State Paper Offices, in e Street, pulled down for the Foreign Office; the Board of Trade Offices, Whitehall, of which a fine model is to be seen in his museum; this building was refaced by Sir Charles Barry. Soane refaced Whitehall Banqueting House in 1829. He also erected the Scala Regia, Royal Gallery, and Library to the House of Lords, and later additional committee rooms, and designed plans for the new Law Courts there.

The alterations made to the Freemasons' Hall in 1815 were burnt down in 1884, and his other works include No. 189 Fleet Street, for Praed's Bank, the Insolvent Debtors' Court in Portugal Street, alterations to the College of Surgeons in Lincoln's Inn Fields, and Nos. 57 and 58 in that square, the new Infirmary to Chelsea Hospital, and alterations to St. James's Palace.

In 1808 Soane was occupied with the erection of a mausoleum to Mr. Noel Desenfans, adjoining the house of Sir Francis Bourgeois in Charlotte Street (now Hallam Street), Portland Place, and the sarcophagus to the same gentleman in connection with Dulwich Picture Gallery was erected in 1812; their pictures are housed here, being incorporated with those of Alleyn's College of God's Gift, Dulwich. Soane also added the anteroom to Chantry's studio in Belgrave Road, Pimlico, and the monument to Samuel Bosanquet, Esq., in Leytonstone Churchyard.

His works at Reading include the obelisk in the Market Place, for E. Simeon, Esq., and houses for Messrs. W. B. Simmonds and L. Lustwick.

In addition we may mention the building of many private residences in Norfolk and Suffolk, including Shotesham for Robert Fellowes, Esq., alterations to Norwich Castle and Blackfriars Bridge at Norwich, which was built with leaded joints to prevent the voussoirs slipping. (Now removed in favour of an iron construction.)

(To be concluded.)

THE ARCHITECTURAL ASSOCIATION.*

(Concluded from last week.)

I HAVE lately been reading some of Sir Joshua Reynolds's discourses—a work I would commend to your notice—and I was struck with the earnestness with which he impressed upon the students of the day the necessity of possessing themselves with the spirit of the great masters; and also with the manner in which he cheered them with encouragement to be determined to succeed when he roundly states, "He should have felt the same determination to become the most eminent physician as he then felt to be the first painter of his age and country." Such a statement, in its simplicity, reminds one of the remark attributed, I believe, to Mr. Edison, "that success in life is due to 1 per cent. of inspiration and 99 per cent. of perspiration."

---

* **Opening Address by the President (Mr. G. C. Horsley), delivered on October 2.**

It was Sir Joshua Reynolds who, as I daresay some of you will remember, went, as a distinguished young painter of thirty years of age, to Italy to see for the first time the work of the great masters of the Renaissance. So impressed was he that he has written he felt he must become again as a little child, he had so much to learn. In this wonderful humbleness of heart Sir Joshua reminds me of Sir Christopher Wren, who showed the same willingness to learn, as is illustrated in that most interesting letter, which you probably know, which he sent from Paris, where he had gone for the purpose of study. Surely, these two men were much alike in character, with the same wide and sane way of looking at things, and the same thirst for knowledge. That "spirit of the old masters" which they possessed made them strive for a right kind of perfection in their work. It made them reject what was small and petty, and adopt the manly and virile. It made them discern and eliminate their defects, for, as Sir Joshua said to his students, "it was not by their defects that considerable artists acquired their reputation; they have a right to our pardon, but not to our admiration." He also taught that a student must not by mistaken industry lose his time in that which is merely ornamental. And in speaking of copying the old masters he says: "Instead of copying the touches of those great masters, copy only their conceptions. Instead of treading in their footsteps, endeavour only to keep the same road. Labour to invent on their general principles and way of thinking. Possess yourself with their spirit. Consider with yourself how a Michel Angelo or a Raphael would have treated this subject, and work yourself into the belief that your picture is to be seen and criticised by them when completed. Even an attempt of this kind will rouse your powers." He knew of his art, as we know of ours, that it is a progressive art; it is ever growing; and to-day, when science advances with strides, when space is being conquered, and distant lands may soon be easy of access, who among us can prophecy the future of the young architects? It shines in the distance as something mysteriously and gloriously interesting. And that future is not for these men only who carry off the most prizes. We cannot all be "Prix de Rome" men. It is for all who do good work. And again I quote from Robert Louis Stevenson: "All who have meant good work with their whole hearts have done good work." No man, even the greatest, ever arrives at the ultimate goal; he does his part, and passes on his experience to the next in the race, and very soon that responsibility will be yours. The future is for you, as, again, it will be for the young men who come after you.

In the meantime, you have to prepare for that future, remembering that, according to the truth and sincerity, the high ideal that you put into your work so will your influence upon the public be, and with you rests the education of the public. In order to emphasise this, I am again going to quote to you from Sir Joshua Reynolds's "Discourses," and I do not apologise for this, because, as I have told you, great men are our best teachers. In speaking to his audience on the subject of raising the public ideal, he reminds them of a remark of Euripides, who said to the Athenians, "I do not compose my words in order to be corrected by you, but to instruct you." And he adds, "It is true, to have a right to speak thus, a man must be a Euripides. However, this much may be allowed, that when an artist is sure that he is upon firm ground, supported by the authority and practice of his predecessors of the greatest reputation, he may then assume the boldness and intrepidity of genius; at any rate, he must not be tempted out of the right path by any allurement of popularity which always accompanies the lower styles of painting."

I think we may say that this is equally true of architecture; great men, who are the truly thoughtful men, always sound again and again the note of character. They know that a nation's place depends upon its national character, and the men and women of the day are the nation. In a sense we are all artists, but to you young men, who are not only artists in this general sense, but belong to one of the noblest—perhaps the noblest of the artistic professions—I would quote as a motto, and in conclusion of my address, King Alfred's words, "This will I say—that I have sought to live worthily the while I lived, and after my life to leave to the men that come after me a remembering of me in good works."

Mr. Arthur Keen, retiring President, in proposing a vote of thanks, said it was the privilege of the ex-President to propose the vote of thanks to the incoming President for his address. He (the speaker) had known Mr. Horsley from the day when he first entered on his architectural career, and it was, therefore, a very great pleasure to find Mr. Horsley occupying so worthily his present position. They had just been given a very thoughtful and interesting presidential address; indeed, it was one rather for thinking about than speaking about. Mr. Horsley had made us of two quotations from King Alfred. The latter on seemed peculiarly appropriate because an architect's wo was so enduring, and if it were good it exerted an influen for a long time. The other was also appropriate becaus at the Architectural Association the tools used and th materials put at the disposal of students were so of the ve best that they did not know how to make them better. Th student undoubtedly must not lose his time on what wa merely ornamental; but they did believe in proceeding fro building to architecture. The syllabus of the Board Architectural Education was a very remarkable and fin document. The architectural expression of a buildin must be the expression of the uses and construction of tha building. There was this danger connected with the teaching of architecture in a school—that it might tend t much to pencil and paper without reference to actual thing In thinking of this subject he always comforted himse with the reflection that here in England they had had any rate a Gothic revival. No one could realise how gre is the influence of that revival; it remained still with and acted as a powerful corrective. In the address ju delivered they had been hearing about the founders of th Association. Those men did not for a moment realise ho far their work was going to develop. Neither did the office at the present time have any impression how far it w likely to go in the future. The Architectural Associati had now come to a time when there was a second shaking dry bones. Until the various schools were co-ordinated was impossible to get the best possible results. The Roy Academy had now at its disposal such assets as no oth school possessed. If the Royal Academy came into li with the other schools the results could not fail to be the best kind. The R.A. must realise that it should be the head of all the schools of the country. He himself d not know what the projected school at Rome was to co sist of, whether merely a school of architecture and arch ology, or whether it would include painting and the oth arts. He believed, however, there would be an opportun of sending out students in considerable numbers before ve long. In conclusion, he would formally propose a ve cordial vote of thanks to Mr. Horsley for his admira address, and congratulate both him and the Association, he looked forward to a very successful year of office with Horsley at the head of affairs.

Mr. W. Curtis Green, Vice-President, in seconding vote of thanks, said that in 1892, the year he started his architectural pilgrimage, there was published a b called "Architecture: A profession or an art?" master he was then with gave him a copy. It was edi by Mr. R. Norman Shaw and Mr. T. G. Jackson, and consisted of a series of essays by eminent men on qualifications and training of architects. One of the m inspiring essays of the book was by their President, Horsley, entitled "Unity in Art." This was a deligh essay, and as true to-day as when it was written. Fr that time Mr. Horsley became a name to him high among those who counted. Twelve years ago it fell to good fortune to become a neighbour of Mr. Horsley's, he found that unknown young men were admitted to circle. If it ever fell to his lot to live in London ag he could desire no better fortune than to again becom neighbour of Mr. Horsley's on Campden Hill. Those went on the A.A. excursion in the summer knew his qu ties as a leader. They desired nothing better than follow his lead and to make his year of office worthy of him and of the best traditions of the Architectural A ciation. All had just listened to an inspiring addr its scholarship and wise discretion and wit must h impressed them very greatly. It was only a man Mr. Keen who was qualified to speak of the labour self-sacrifice necessary to fulfil the duties of office. T Architectural Association stood for unity in art. T could feel that it was now living up to its great reputat ot service.

Mr. Paul Waterhouse remarked that the President been talking to them on a subject which was most inter ng, viz., themselves. They were, of course, all students, hough not perhaps in the sense of being between 18 and 28 ears of age. But no man who was an architect, or hoped be useful as an architect, could ever abandon himself the feeling he was aged or even middle-aged, for he ad to possess that spirit of youthfulness which would nable him to spring upon a new job with as much keenness s a student enters for such a competition as the Soane. here were architects of all kinds, and now and again there ere architects who combined in themselves many different ualities. It would be noticed that the successful architect supposed to become a public speaker as well. As Mr. orsley had proved his worth in that *rôle*, many might be pt to say, "Give us the good old days which have produced men such as our President!"

The vote of thanks was carried with prolonged acclamaon.

Mr. Gerald C. Horsley acknowledged the vote, making pecial reference to Mr. Arthur Keen and his work last ssion as President. It was, he concluded, his firm intenon to do all he could to further the best interests of the ssociation, and he knew he would have the support of the embers during his term of office.

THE GLOUCESTERSHIRE ARCHITECTURAL ASSOCIATION.

HE fifth meeting of the session was held at the Northgate Mansions, Gloucester, on Thursday, September 28, e President (Mr. Walter B. Wood) being in the chair.

A large number of members and friends were present to ar a lecture on "Landscape Architecture" by Mr. Thos. H. awson, Hon.A.R.I.B.A.

In the course of his lecture Mr. Mawson said: I can sure you that I did not select the subject of my lecture thout due consideration of the consequences which it might volve. Nor did I forget that the art, the claims and the udy of which I am to advocate, is in its most important pect practically unknown in this country. At one time almost considered the risk too great; for I thought that all probability the members of this Society were banded gether for mutual protection and that they were probably gistrationists to a man, and that an alien like myself might t be allowed to peaceably enter this household of faith. I d, however, I was all wrong, and that the Society is really nded together for mutual improvement, for the elimination ego, the bane of modern architects, and for the fostering of classical education, and particularly for the purpose of curing to their younger brethren every advantage which search and scholarship can give them. This Society aims gh and hopes that some day English architecture may im an academic course equal to the Ecole des Beauxts, or some of the new American schools of architecture. is being so, I feel that I may have something to contribute, d that I may be even able to suggest a useful though gthy course of study, the fruits of which will meet with due reward when once our town councillors awake to the ct that in the development of cities on topical or æsthetic es they are hopelessly behind any part of the civilised rld.

That we have lost that fine sense of spacious planning ich has given to us modern Edinburgh and so many London ares, few will deny. Nor will the travelled man or woman ny also that whilst we are becoming less spacious in our ys and more trivial in our planning, more individualistic d less communistic in our architecture, other countries are rning the restraint which ever characterises the highest .

Though it may seem to be a digression, I venture to offer an planation for this disparity between our own conditions d those which obtain abroad. It is simply this, that as in England acquire wealth we seek the country and the tractions of sport.

Abroad as a man acquires education he draws nearer the art of the city, where he finds art, music, literature, and se other refreshments of the mind which are necessary to intellectual life. The student of landscape architecture ds that both the wealthy Englishman and the educated eigner both demand beautiful surroundings. The Englishn has his country seat, fine gardens, and expansive main wherein to take his pleasure. Abroad, the man who ks the city combines with others to surround themselves th beautiful parks and gardens, but these are for the use all and free to all.

So much by way of preface. Now let us try to understand at is meant by "Landscape architecture," and how the art n be acquired.

As usually understood, "Landscape architecture" conjures up to the mind a slight and partial infusion of colour, neatness, and prettiness into the domain of nature or the surroundings of our homes. Whether these scenes are romantic or commonplace it conveys no more to the mind than dressed-up improvements. Others again think of it as a happy field of *laissez faire* in which there is no constructive beauty. To them "Landscape architecture" is not an art, but something to play with, which may be taken up or dropped at will. How wrong this is we will seek to show.

The successful landscape architect must not only be able to build up in his mind's eye the whole of the buildings, roads, parks, gardens, ornaments, and utilitaria into one harmonious comprehensive scheme, of which he is able to prejudge the effect, but must have that intimate practical knowledge which will ensure his giving full effect to his dream.

To do this successfully the landscape architect has not only to study architecture in the round, but he must also have a keen appreciation of natural objects and features, and possess the power to weave the natural and the artificial together without discord.

I think this is generally conceded to the art in its relation to domestic architecture, and very few architects would nowadays undertake the design of a country domain without consulting the man who has schooled himself in these larger problems of landscape and garden composition. To this extent we may say the art is recognised in England. How does it stand in relation to town development? Surely, if anything this is where the landscape architect is absolutely essential.

Some eighteen months ago I was severely taken to task by the entire London press for stating at the annual meeting of the County Municipal Engineers that "Whilst English private gardens are incomparably beautiful, our public parks and gardens are the work of the crudest amateur." How differently these matters are directed in other countries.

The lecturer pointed out that in America the profession of "Landscape architecture" is far more developed than is the case here, and it was his opinion, from his acquaintance with America and Canada, that the profession of landscape architecture is gaining and must continue to gain in public appreciation in both those countries.

"The reason," Mr. Mawson said, "for the greater advance made by the profession in America than here is threefold. First, we have the fact that it is a comparatively new country, which is not only less hidebound by tradition and precedent, but one which, by its rapid growth, provides many more opportunities for the effective application of co-ordinated architecture; and, secondly, the absurd pretensions of persons in England totally unqualified to fulfil its duties, in whose hands many splendid opportunities have been thrown away; thus the minds of those who are capable of estimating the worth of the occasion are filled with a disgust of the whole profession. Lastly, and by no means least, we have here the most unfortunate etymological significance of the term 'Landscape architecture,' which suggests to many persons in this country either unwarranted interference in the realms of nature or a childish attempt to introduce it into our towns by little patches of futile gardening. If it were not that the modern significance of the expression is clearly understood both in America and on the Continent and that its use has become general and more or less unalterable, one would be tempted to advise the adoption of some other term, which would, by its construction as well as its application, describe and designate the 'architect-co-ordinator' whose province it is to arrange on an effective plan scattered and detached architectural units."

How little the subject is understood in England, even in well-informed circles, is shown in a recent article by Mr. Abercrombie in the *Town Planning Review*, in which the writer so strongly advocates the example of America and several Continental countries.

To avoid a misunderstanding, I would draw a line of distinction between garden design, whether called "Garden architecture" or "Landscape gardening," on the one hand, and "Landscape architecture" as the term is understood in America. The first relates, for the most part, to the creation of those private gardens of which, I have already stated, Englishmen have every reason to be proud; while the latter, though it includes the architecture of gardens, has most to do with works of a public nature, including the planning of cities.

It is characteristic of the attitude of the public generally to the profession in this country and in America, that while, here, few people nowadays venture to lay out a private garden without professional advice, the municipality still prefers the amateur's efforts to the skill of the professional. In fact, so great is the importance they attach to the art that the schools are not only splendidly equipped but are increasing in number. So determined are Americans to extract the best that the work can show that they send their professors on long quests to Europe to study Classic examples of landscape architecture at first hand, and to collect whatever literature, ancient and modern, can be got together for the use of the students.

Here, however, we are differently placed, for, notwithstanding the excellent curriculum provided by the Liverpool School of Civic Design, which, in many respects, is unique, it may yet be truly said that we are still without a school where the essentials of the art of landscape architecture as applied to civic betterment may be studied.

This brings us to the question—What are the essentials of the art? And what is the equipment, theoretical and practical, necessary for its practice? First, it may be emphatically stated that the pupil must start with a liberal education so that he may be able to exercise that catholicity of taste, power of concentration, love of orderly progression and logical sequence which can only be gained by imbibing the spirit at least of the classics. On this foundation must be built a knowledge in the round, and sympathetic interest in all the various branches of architecture, so that he may be able to meet and sympathise with the specialist in each branch of the profession, whether domestic, ecclesiastical, commercial, municipal, or otherwise.

He is to fit himself to design parks, gardens, and control natural reserves and park systems in a way that accords perfectly with the surroundings—that is, his design is not to be in any sense of the word disjointed, as most of our English civic parks seem to be. To this must be added, or it must be projected upon a study of sociology, engineering and architecture, botany, horticulture and arboriculture, which makes, broadly speaking, the full subject of town planning, which is in the American mind incorporated in the term landscape architect.

He must previously have had an expert training in surveying in all its branches, including the modern rapid methods of tacheometrical contouring, and must understand the geologic and other influences which go to make the different local conditions and the formation of the various soils to be encountered.

There are other minor affiliated branches incorporated with these in the Liverpool School of Civic Design, such as the legal aspects of town planning (seeing that we are more bound by precedent than the newer country); but, broadly speaking, apart from these national or local differences, we are at last following the ways of our countries, although we prefer to call the art by another name.

For the practice of landscape architecture, however, much more than this is needed, for, unlike other practitioners, the work of the landscape architect in city development is not so much the design and erection of units as the control and composition of extended areas and the harmonising of a multiplicity of features, natural and artificial; the first differing in scale and bulk from year to year, and the second constant and abiding. These features must be so manipulated, with a sound practical knowledge of probabilities in the case of the less stable factors, so as to make at all periods in their development a stately or picturesque whole.

Again, while in other branches of architecture a study of linear perspective so far as it relates to the portrayal of individual buildings or groups of buildings is necessary, in landscape architecture the fully equipped practitioner must be able to make birdseye views of the whole city, not, indeed, with the architect's close attention to detail, but in order to show a masterly group of broad areas in mass. Even this does not exhaust the list of the more obvious essentials of this branch of the profession of architecture, for the student must also attain an educated "sense of locality" which will enable him to grasp the practical and æsthetic possibilities of the site, to build up in his mind's eye a picture of the city to be, and, above all, to present his conceptions to others graphically and pictorially in such a manner that they too may participate in his vision and become fired with his enthusiasm.

This, I submit, is a standard of attainment which cannot be reached by way of the American School of Civic Design, even if the student shows a natural aptitude in these departments, for it needs the best teaching of each, supplemented by outdoor studies.

I do not say that this combined course of study and preparation is necessary for the architect in general practice on the one hand, or the landscape gardener on the other; it is, however, necessary for the practice of city planning.

If I may be permitted to draw a comparison between the professional standpoint in England and America on this subject, I would say that, while the English architect too often imagines that what really matters is a knowledge of architecture such as is demanded under the examination scheme of the Royal Institute of British Architects as a sufficient training for the man who designs both cities and gardens, the professors of landscape architecture in America, with equal sincerity, hold that an expert knowledge of scientific surveying and contouring, botany, arboriculture, traffic problems, and a proficiency in draughtsmanship are sufficient for successful city planning, and therefore neglect the study of architecture. In both cases the outlook is too restricted.

This brief and very incomplete examination of the necessary equipment of the landscape architect will show that there is pressing need for the formation of some association, not necessarily composed entirely of professional men, for the study and promotion of landscape architecture. Assuming for the moment that we are agreed that a special training is necessary and the profession an important one, can we find a sufficient number of men willing to give up at least six years to academic studies, and have we the means of imparting the necessary training? To the last question I emphatically answer "Yes," but with the lack of organisation and co-ordination, so characteristic of our British methods, great projects do not make for effective collaboration, yet these will be necessary if we are to frame any project on the lines sketched out, and if we are to utilise what at present exists.

I can quite imagine you saying that landscape architecture is something very different to what you thought it to be. Gentlemen, it covers the whole field of civic art, and therefore only those who are born idealists and who possess great tenacity of purpose can hope to gain a recognised position in its ranks.

In a country where practical instruction counts for so much it may be asked—indeed, I am often asked—what are the prospects? Of course, all admit that the profession is a delightful one, but what are the material prospects? I do not know; but this I do know, that never was a call of service stronger or the need for missionary zeal more pressing. Our heathens are at our doors. Nay, in this cathedral city of Gloucester, with its rookeries and sordid squalor, you need awakening to civic consciousness, to the value of your glorious possessions, and equally to the range of your opportunities, to the need of pleasant boulevards, green spaces, of the restoration of your river banks, so that your citizens may take their leisure uninterrupted by those constant reminders of industrialism from which we all seek to flee.

Civic art is so utilitarian in its purpose to be civic first and art afterwards; and yet, to love our city, we must make it lovely. This can only be done by awakening in the soul of the citizen that high desire for civic art which has so long lain dormant. This dormant pride can only be aroused by setting before the people a tangible vision of what their city is capable of becoming. The dream of what one's city should be and may be, and even some day must be, will be a special inspiration to those professors of the fine art upon whom the beauty of the city ultimately depends. It is the work of the landscape architect to present this dream in its most alluring form.

Mr. Mawson then showed a number of extremely interesting lantern slides, among which were a fine series illustrating his scheme for the improvement of Bolton, and a charming set of photographs showing the laying out of large private gardens carried out by the lecturer.

A short discussion followed, and a hearty vote of thanks was accorded Mr. Mawson for his scholarly and fascinating lecture.

WOLLATON HALL MSS.

THE latest volume of the Historical Manuscripts Commission is a bulky one of seven hundred odd pages, dealing with the manuscripts belonging to Lord Middleton, and preserved by him at Wollaton Hall, Nottinghamshire. The report has been prepared and edited on behalf of the Commissioners by Mr. W. H. Stevenson, M.A., editor of the Nottingham Borough Records, &c.

The principal part of the collection consists of an enormous number of mediæval and later deeds, charters court rolls, and the like, relating to thirty counties. The wide area covered is due to inter-marriages contracted by the descendants of Ralph Bugge, the founder of the family, a

Nottingham merchant living in the reign of King John. A number of the manuscripts, however, were written during the hundred years before his time. The earliest relating to this merchant family is a grant of about 1250 by Walter, prior of Worksop, and the convent, to Richard Bugge and his heirs to have a free chantry in his chapel, within his court at Willoughby-on-the-Wolds. The descendants presumably sighed for a more euphonious name than Bugge, and they took up the territorial names of Bingham and Willoughby from their Nottinghamshire possessions.

The Manor of Wollaton was acquired in the reign of Edward II., when Richard de Wylgheby, senior, was assigned eighty acres of wood and the advowson of the churches of Wollaton and Cosshaile (Chilwell). Two years later he demised to Adam, son of Nicholas, and to eight other men of Chilwell, his mine of sea coal with exemption from payment of rent when hindered from working by fire-damp.

The situation of the Wollaton district on the outcrop of the great Derbyshire and Nottinghamshire coalfield caused it to be the scene of early coal-mining, upon which considerable light is thrown by the numerous papers concerned with this industry. It is somewhat surprising, says the Editor, to find that in 1316 the workings were already so deep that provision had to be made in a demise of a pit for non-payment of the rent or royalty in case the seven miners to whom the pit was let were prevented from working by the "*ventus, qui vocatur le dampe.*" This carries the history of fire-damp three centuries beyond the earliest quotation in the "New English Dictionary." The business of coal-merchant seems to have prospered if we may judge from a statement of the charge, receipt, and delivery of coals at Wollaton week by week from October, 1597, to October of the following year, when the total value was between £2,000 and £3,000.

Another interesting item in this connection is the record of the use at the end of Elizabeth's reign of rails for the conveyance of coals to the riverside for shipment. In 1605 we find careful proposals for carrying coal by the Trent to Hull for shipment to London. But the cost of conveying the coal to Newark or Gainsborough, transhipping it there, and the freight from Hull rendered this attempt to compete with the Newcastle supply unprofitable. A few years later there was put forward an invention for an improved pumping machine for use in coal-pits in place of old-fashioned chain pumps such as were then used in London, according to the inventor, "to force the Teames water to serve there houses." The specification begins as follows:—

"An ingin to be made that shall drawe fifteene tunne of water in one hower's space at one hundred fadam depth, with this hellpe onlye of two able menne; if the depth be but fiftie fadam, one manne shall draw the haulfe of fifteen tunne of an hower. And for a cleare proofe that this may and will be fully effected, the partie desiring of such an ingin shall have a modell of it made, by which it shall be clearly manifested unto him that it will carrie or dryve the water to any height whatsoever wheare a pipe may be fixed, below, right up or sloape. The worke or ingin to be lett downe into the myne or pitt shall not be above three footte square and six footte high, to be taken in peeces and sett together agayne in two hower's tyme. Theare is a modell allredie made of wood, by which it will be made manifeste that the greate frame, no bigger yet then as aforesayed, shall worke the effect above mentioned. Theare is demaunded for the greate worke for his device and paynes only one hundred pounds after the ingin is founde to worke the promised effect, conditionally that the inginere may keepe the key of the worke himselfe, only that no other may know the secretes of it; which after it is fully fynisht, hee will mayntayne at his owne charge, beinge yearly payed fiftye pound at Michellmas and Our Lady Day by equall porcions. The charge of the greate worke at first to the partie that will sett the inginer on worke will be fortie pound, the pypes excepted, which are presumed to be in any goinge worke allredie. It is mutche wished and desired that suche an ingein may be seene in worcke, as well for the good of a (*sic*) comon wealthe as his benefitt that shall or can continuwe it."

The industry of the working of ironstone in the district was carried on at least as early as the middle of the thirteenth century. In 1275 there was a grant by Adam, son of Robert de Coshale (Cossall, co. Notts), to Henry, son of Perot of Coshale, of five "lands" (*seliones*) of land in Stenen Rydyng, and of a plot of land in which ironstone was formerly dug (*unam placiam terre in qua lapides ferri quondam fod*[*i*]*ebantur*), in exchange for the heads of four "lands" lying near the Fildy[n]ggate and abutting upon Brokeshale Milne Brok. In Elizabeth's time there were ironworks at Wollaton, Notts, in Duffield and Codnor, Derbyshire. Sir Francis Willoughby also held ironworks and collieries under Elizabeth Countess of Shrewsbury, at Oakamoor, Staffordshire, the weekly account books of the sales there being preserved from 1590 to 1600, and 1605 to 1608. The weekly charges for the iron-mills at Codnor in stone and getting coal brought to the furnaces and the labours of the "fyners" and "hambermen," *i.e.*, refiners and hammermen, &c., are extremely interesting.

The Sir Francis Willoughby above mentioned was the man who erected Wollaton Hall. Cassandra Willoughby, Duchess of Chandos, the daughter of Francis Willoughby, the natural philosopher, writing at the opening of the eighteenth century, gives the following description of Wollaton Hall:—

"The new house is placed upon a hill about half a mile from the old hall, from whence there is a very noble prospect of the country round it. One side of the house looks upon the castle and town of Nottingham; from another there is a fine view of Clifton House and gardens, the seat of Sir Gervas Clifton; from the other sides of the house there is the prospect of several houses and little villages, and each corner and middle of the house pretty near point to churches that are about two or three miles off. The house itself is a very noble pile of building, but it being less easie to describe it by writing then by drawing, I design to place at the end of this book a draught and a plan of it, and shall therefore only mention here that Sir Francis Willughby began this building A.D. 1580, and finished it A.D. 1588. The master workmen which built the house he sent for out of Italy, as also most of the stone figures which adorn the house. All the stone which it is built with was brought from Ancaster in Lincolnshire by the people who dwelt there, and who exchanged their stone with Sir Francis for his coal, which they carried back from Wollaton. But notwithstanding the stone and its carriage cost nothing but the return of cole which Sir Francis made for it, and that at that time labourers' wages was very small, yet it appears by a very particular account of the building, which still remains in the library, that the building of that house cost Sir Francis Willughby four-score thousand pounds."

The Editor of this volume says that the accounts just referred to have not been found. The figures represent in the money value of the time an enormous sum. It is suggested that there is probably some mistake either in the figures themselves or in overlooking other things in the account. Camden thought the hall was built by Sir Francis Willoughby in a foolish display of his wealth. It is not surprising to learn that Sir Francis was sometimes hard pushed for ready money, and had to borrow at ruinous rates of interest. He was, however, a very methodical man, and carefully preserved his correspondence. Under date February 14, 1585, we find an account of Thomas Grassworth, servant to Sir Francis Willoughbie, knight, of money received and disbursed towards the charge of building. He accounts for 1584 from Sir Francis £75; for 1585 from Sir Francis £371 15*s*. 6*d*. (the last figure crossed out), from John Speid £329 6*s*. 4*d*., William Blythe £106, Mr. Gedney by the hands of Mr. Smithston £35 6*s*. 4*d*., Geoffrey Fox £149 19*s*. 4*d*., and for other receipts from them £109 3*s*. 4*d*.: total (with other items) £1,192 8*s*. 6*d*. Payments to freemasons in 1584 £43 18*s*. 8*d*., in 1585 £257 16*s*. 8*d*.; to carpenters in 1584 £15 18*s*. 10*d*., 1585 £61 18*s*. 6*d*.; to joiners in 1584 £18 8*s*. 8*d*., in 1585 £70 8*s*. 11*d*.; to labourers in 1584 £19 4*s*. 0½*d*., in 1585, £91 0*s*. 7*d*.; to plumbers in 1584 £21 19*s*. 6*d*., in 1585 £17 13*s*. 2*d*.; to sawyers in 1584 £7 4*s*. 3*d*., in 1585 £18 1*s*. 11*d*.; for necessaries in 1584 £3 8*s*. 10*d*., in 1585 £15 6*s*. 10*d*.; for "lymeston" in 1584 49*s*. 6*d*., in 1535 25*s*. 3*d*.; to "layers about the buildinge" in 1584 £7 13*s*. 9*d*., in 1585 £36 18*s*. 1*d*.; to painters in 1585 £19 15*s*. 10*d*.; for twenty-two strikes of charcoal "for the fyninge of leade ashes" in 1585 7*s*. 4*d*., for carriage thereof 10*d*., for hiring and carriage of a pair of bellows 5*s*.; to William Hill for making 199 "thousand" of bricks at 2*s*. 3*d*. the thousand £19 5*s*. 3*d*., and "for castinge of earth" 20*s*.; payments to divers men, including Robert Smithston, who received in 1584 £4, in 1585 £73 6*s*. 8*d*. Total payments: £1,153 10*s*. 6½*d*.

Sir Francis impoverished himself by his building and land-purchases and by his attempts to grow woad, to make iron and glass, and, partly owing to this and to the portion left to his second wife, a mere shadow of his estates passed to Sir Percival Willoughby, his son-in-law, the grandson of Sir Edward Willoughby, who united the families of Willoughby of Wollaton and of Willoughby de Eresby, through whom Lord Middleton comes to represent the male line of the great baronial family of Willoughby de Eresby.

Building accounts of Wollaton Hall for 1582-3, 1584-5, 1586, 1587, 1588, are preserved. These consist of books of the payments of wages week by week and of other payments by the clerk charged with the payment of wages, and of statements of receipts and expenditure. They give very little information beyond the names and rates of pay of the workmen engaged upon the building. There are payments for "hewing" ashlar at Ancaster, and several payments to Smithston as imprest for task-work, but there is nothing to show, says the Editor, that he acted as "Architector" in the modern sense, as he has been said to have done on the authority of his epitaph in Wollaton church. There is, however, nothing in the accounts to disprove that he held this position. In 1587 the payment to him is said to be "to paye owte for taske worke." In September of this year there is a payment for "making a cesprey (conduit-pipe) for turning the water to the new howse, xix*d.*" In November of the same year there is an entry of "paid to the joynour of Darby by myself in parte of payment for seeling the dyning parlour, being 180 foote of measured weynskot at ij*s.* le foote, v*li.*; paid to him by my master at twoo severall tymes for the same worke, xiij*li.*"

The manuscripts give a thousand and one curious sidelights on the times in which they are written. The first owner of Wollaton Hall, for example, set out minutely the regulations for his large household, as well as the contents of the several rooms. But these constructional particulars form only a very small portion of the volume. The student of history, even more than of architecture, will find nuggets of pure gold every time he delves into the pages for information.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) illustrates the accepted competition design for the Washington State Capitol by Messrs. Wilder & White, and also the design by Messrs. Howells & Stokes which obtained the second prize in the competition. Other illustrations are of buildings erected—the Ives memorial library, New Haven, of which Mr. Cass Gilbert is the architect; and houses in Massachusetts, by Messrs. Bigelow & Wadsworth, and by Mr. Hubert G. Ripley.

The *Architectural Record* (New York) has a country house number, and gives a good series of illustrations of the most modern domestic architecture in the United States. Included in the number is an article on English garden design, illustrated by examples of the work of Mr. Thomas H. Mawson.

Der Architekt (Vienna) has for its most interesting items designs for the Ferdinand bridge at Vienna, by Professor Alb. H. Pecha and by Herr Josef Hackhofer. There are also designs of the usual new-art type and some illustrations of old work.

Berliner Architekturwelt (Berlin) is this month a monograph on the extensive restaurant and refreshment buildings recently erected at the Zoological Gardens of Berlin, from the designs of Messrs. Jürgensen & Bachmann.

La Construction Moderne (Paris) illustrates the working-class dwellings in the rue de Prague, Paris, erected at the instance of Baron Alphonse de Rothschild, and Messrs. Georges Picot, Emile Cheysson and Jules Siegfried, by the architects, Mons. Nenot as consultant, and Messrs. Provensal, Demierre, Asseline, Majou, Ventre, and Besnard.

Deutsche Bauzeitung (Berlin) completes its description and illustration of the new Rathaus at Wittenau, near Berlin, and illustrates also the new Stadt theatre at Freiburg, in Breisgau, and the new Stadthaus at Berlin. An interesting illustrated article also appears on the old town houses of Hamburg.

Het Huis (Amsterdam) contains a descriptive article on old hunting boxes and country seats on or near the banks of the Vecht, illustrated chiefly by reproductions of old engravings.

Moderne Bauformen (Stuttgart) is this month devoted to the work of architects practising in Hanover, principally domestic work, and all more or less tinctured with "neubau" feeling.

The *New York Architect* (New York), with its usual beautiful photogravures, is restricted to the work of Messrs. Hoppin & Koen, chiefly country and city residences of important size.

Engineering Record (New York) gives an account of another building in which the walls were formed of reinforced concrete in a horizontal position and afterwards raised to the vertical by screw-jacks. This is a factory building 40 feet high in Illinois.

Mr. Walter Cave, F.R.I.B.A., has been appointed by the trustees of the Whiteley Homes as their consulting architect in regard to the proposed competition for laying out the site of the homes at Burhill, Surrey.

COMPETITION NEWS.

Dunfermline.—A special meeting of Dunfermline Parish Council was held on the 6th inst. for the purpose of receiving the adjudicator's awards on the competitive plans for the erection of new offices for the Council in Abbot Street. The following was the award:—

	Probable Cost.			Probable Rental of Lettable Portion.		
	£	s.	d.	£	s.	d.
1. Plan No. II.	5,882	5	0	107	0	0
2. Plan No. III.	6,247	7	8	47	5	0
3. Plan No. IV.	5,733	0	0	44	5	0

On the sealed envelopes containing the names and addresses of the competitors being opened, the Clerk announced that the plans by Messrs. Muirhead & Rutherford had been placed first, plans by Mr. James T. Scobie second, and plans by Messrs. Ure & Beveridge third. Messrs. Muirhead & Rutherford will accordingly be employed as architects to carry out the work, and Mr. Scobie and Messrs. Ure & Beveridge will receive premiums of twenty and ten guineas respectively.

GENERAL.

The well-known spire of St. Mary's, Stamford, is to be restored, together with the tower.

A lych-gate is to be erected at the principal entrance of Wallasey Parish Church from Claremont Road as a memorial to King Edward VII.

Professor F. M. Simpson, F.R.I.B.A., has prepared sketch plans for the proposed Francis Galton Laboratory at London University. An appeal for £15,000 has been made to cover the cost of the building.

Mr. Frank W. Wills, F.R.I.B.A., is the Lord Mayor designate of Bristol. Mr. Wills was associated with his late cousin, Lord Winterstoke, in the management of the latter's estate on the Mendips, and is intimately connected with local affairs.

The City Planning Association of Winnipeg is busy with plans for improving the city and for heading off all manner of errors into which a rapidly-growing community may fall. Delegates were sent to the Municipal Congress at Chicago last month. The party will go as far south as Atlanta, Georgia, and will visit a number of cities en route, for studying ways, means, and methods.

The parish church of St. Oswald's, Lythe, near Whitby, has just been re-opened after careful and extensive restoration at a cost of more than £10,000. The new work includes a bell-tower 50 feet high, a south aisle and porch, and an extension at the west end. The church dates from the early thirteenth century. Messrs. Rudd & Co., Ltd., of Grantham, were the contractors who carried out the work under the supervision of Mr. Walter J. Tapper, A.R.I.B.A., consulting architect to the Dean and Chapter of York Minster.

The death occurred of Mr. W. F. Salmon, F.R.I.B.A., on the 7th inst. at Kilmacolm, N.B., in his sixty-eighth year. The son of the late Bailie Salmon, he followed a profession with which his family has been associated since 1820. Mr. Salmon was a member of the firm of Messrs. Salmon & Son & Gillespie, 53 Bothwell Street, Glasgow. Several of the principal modern buildings in the city have been erected to plans prepared by the firm, among these being the Mercantile Chambers, 53 Bothwell Street; the St. Vincent Chambers, 144 St. Vincent Street; and the Lion Chambers, 170 Hope Street (the first building in Glasgow constructed of reinforced concrete). A few days before his death he was re-elected Vice-Chairman of the Governors of the Glasgow School of Art.

Mr. Frank Whitmore, the present county architect in Essex, has been appointed the first whole-time county architect for Essex. The net salary has been fixed at £800 per annum; the cost of office accommodation, staff, travelling expenses, &c., to be borne by the County Council; the appointment to be determinable by either party by six months' notice, and to expire on March 31, 1914. Mr. Whitmore is permitted to retain his present appointment as architect at separate remuneration for the new county asylum as regarded buildings to be erected to plans already approved by the County Council, but all other architectural work for the Asylums Committee will be regarded as duties covered by the net salary. Mr. Whitmore will also retain his appointment as architect to the Chelmer and Blackwater Navigation Company.

FORTHCOMING EVENTS.

Saturday, October 21.

Institution of Municipal Engineers : Third Annual General Meeting at Windsor.

Aberdeen Architectural Association : Paper on "Drum Castle," by Mr. W. [illegible]elly, A.R.S.A.

Monday, October 23.

Institution of Sanitary Engineers : Meeting at Caxton Hall, Westminster, S.W. A Discussion will be opened on the Parliamentary Bill on "Sewers and Drains," by Mr. Percival M. Fraser, A.R.I.B.A.

Tuesday, October 24.

Nottingham Architectural Society : Opening Meeting. Paper on "Holiday Rambles in Norfolk," by Mr. H. Gill, M.S.A.,

Architectural Association : Athletic Club Annual General Meeting.

Wednesday, October 25.

Manchester Society of Architects : Paper on "Æsthetic Treatment of Ferro-concrete," by Professor Beresford Pite, F.R.I.B.A.

Thursday, October 26.

Concrete Institute : Paper on "Fireproofing," by Mr. Richard L. Humphrey, of Philadelphia.

Guild of Architects' Assistants : Visit to London County Hall, Westminster Bridge, S.W.

THE SOCIETY OF ARCHITECTS.

FROM the twenty-seventh annual report of the Society of Architects we gather some rather interesting information which, although known for some time past to a few, is now for the first time, we believe, made public property.

The Society was founded twenty-seven years ago, we may remind our readers, for the primary purpose of promoting a Registration Bill and enlisting sufficient support to induce Parliament to make it law. The Bill has in successive years taken various forms and has on several occasions passed its second reading. It has usually been met with opposition, open or covert, from the ruling spirits of the Royal Institute of British Architects.

During the past year, however, a change has occurred, and the Council of the Royal Institute has so far modified its policy as to give effect to the general desire of the majority of its own members and to formulate the principles of a Bill which the Society, with a most commendable spirit of self-effacement, was prepared to accept in the place of that drafted by itself.

Not only was the Society willing to accept the Bill of the Royal Institute, but to further the cause of registration and to enable the architectural profession to present an united front to the outside public on the question, it was ready to merge its identity in that of the Royal Institute by accepting a scheme for the fusion of the two bodies, arranging for the election of members and students of the Society into the various classes of membership in the Royal Institute.

An agreement to this effect between the two Councils was approved by the members of the Society in terms of a series of resolutions passed either unanimously or by very large majorities at a special general meeting held on April 20 last. It could scarcely be expected that any scheme for the fusion of the two bodies would meet with the unanimous approval of the members of both, since any such scheme must in fairness entail concessions on both sides. It is not surprising that in both the Society and the Royal Institute there are some members who look askance at the concessions, and in the Institute some of these have discovered a legal flaw in the agreement which was on the eve of ratification by both the Royal Institute and the Society. To overcome this legal flaw the Council of the Institute have intimated to the Council of the Society that they propose to make an application to the Privy Council for a supplemental charter which will give them the necessary powers to enter into the proposed agreement.

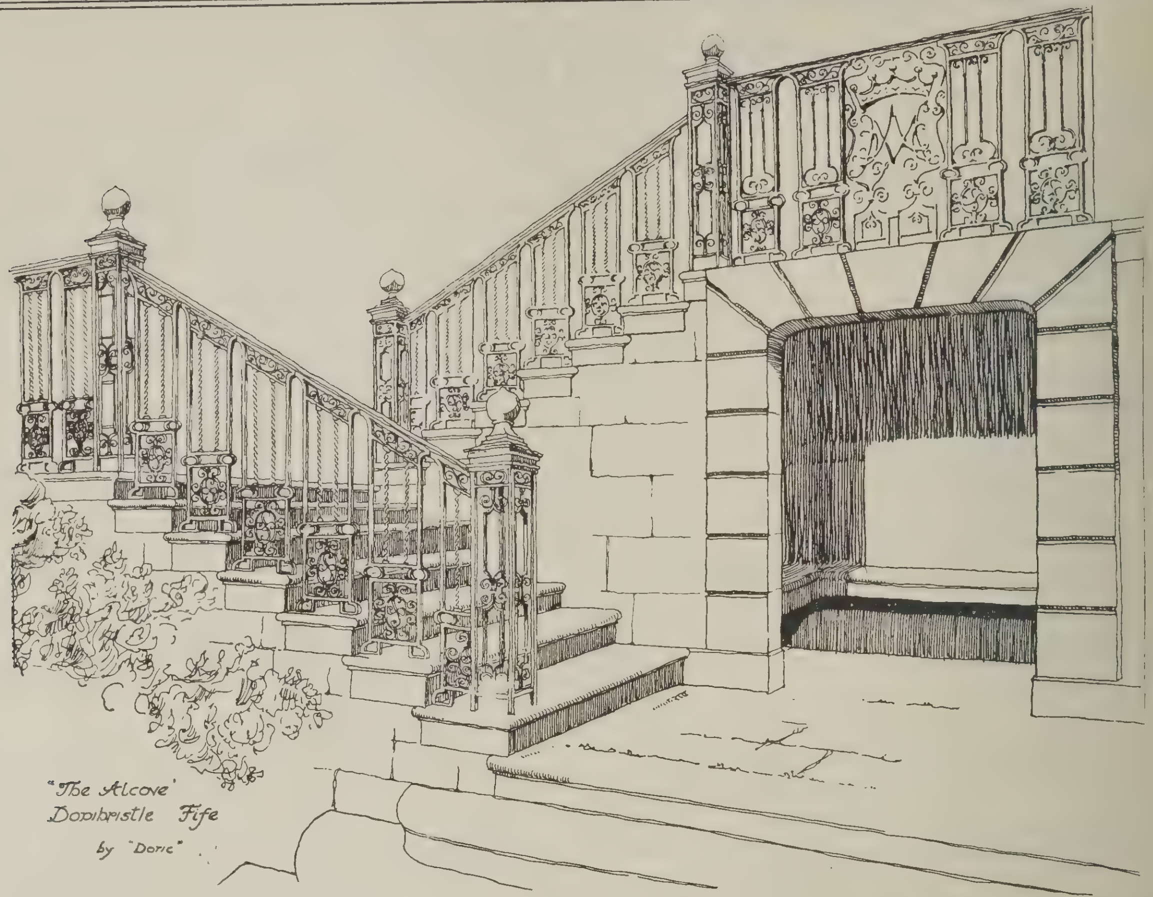
Had the proposed agreement for fusion been duly ratified by both bodies it is probable that the twenty-seventh year of existence of the Society as a separate entity would have been its last, but in view of the complication that has arisen it is only right that the Council of the Society should proceed with the usual programme of active work without reference to the negotiations still proceeding between the Councils of the two bodies.

It cannot be denied that during the twenty-seven years of its existence the Society of Architects has not only done good work in furthering the cause of registration, which was the motive for its inception, but has established for itself a well-recognised position amongst both architects and the public as a representative body of the profession. A body with a membership of one thousand and seventy-six cannot be considered a negligible element in the world of architecture, whilst in the eyes of the general public the Society bulks as largely as the Institute.

The Society has not and does not confine its energies to the propaganda of registration, but has organised all the usual machinery of a professional or learned society. It holds meetings for the reading of papers, for discussion and for social intercourse. It has formed and maintains a library. It holds examinations to qualify for membership, and that these examinations are bona fide in character is shown by the fact that the percentage of candidates who are admitted is very low. The Society also includes a student section amongst its activities, and provides for the students both instruction and prizes.

As a representative professional body the Society has, as detailed in the report, taken action and exerted influence in public affairs with which architects and architecture are concerned. In conjunction with the Royal Institute it has moved on several occasions where the conditions of public competitions have been considered unsatisfactory. The Society's Practice Committee have under consideration the preparation of what is urgently required in the architectural profession, a code of ethics in connection with professional etiquette. This is an exceedingly difficult subject to tackle, and if the Society can evolve a code which shall meet with general acceptance they will deserve the thanks of the whole profession and merit a reputation for constructive political ability which will place them ahead of the slow and tardy procedure of the Royal Institute, whose only contributions to the subject up to the present are a few rather ludicrous resolutions of the Council.

Other public matters in which the Society has exercised its influence are the proposed alteration of the podium



"The Alcove"
Donibristle Fife
by "Doric"

of St. George's Hall, Liverpool; the procedure of the Ecclesiastical Commissioners in issuing detailed designs for parsonage houses, together with specifications and bills of quantities; and the Copyright Bill now before Parliament.

The Society has been able, as the result of good management and business ability, to provide itself with a permanent home, and has satisfied the auditors of the Royal Institute that in the event of the Society becoming merged in the older body there would be an ample margin of assets over liabilities.

Thus we think the Society has shown that it contains members who would be an acquisition of considerable value even to the chief representative institution of architecture, the Royal Institute of British Architects.

NOTES AND COMMENTS.

Manchester looks foolish in the light of the latest resolution of the City Council, passed by the narrow majority of 63 to 55 votes: "That it be referred to a special committee to be this day appointed to consider and report upon the expediency of (1) purchasing the Manchester Royal Exchange undertaking and adapting the existing building for use for the purpose of a free reference library; (2) building upon the Piccadilly site a municipal exchange that would not only fulfil the present and future commercial requirements of Manchester as a great industrial centre, but also make provision for the establishment of a 'spot' and 'futures' cotton market; (3) and that all existing resolutions of this Council which are inconsistent with the foregoing objects be suspended (except for the purpose of carrying out or completing obligations which have been entered into)." The site on which some members of the City Council now wish to build an exchange is that for which many architects have spent many months in trying to fit too much accommodation as required by the particulars of the competition for an art gallery and reference library.

The City Council of Manchester have played the fool with architects by inviting them to enter into a competition for a certain building, allowing the competition to go through all its stages till the award of the assessor has been made, and then putting the whole thing on one side in favour of another scheme. Moreover, the Council by promoting an abortive competition have wasted thousands of pounds of the ratepayers' money, and we shall hope to see the members of the Council surcharged by the auditor with the money wasted.

Manchester men have usually been considered by the rest of the Kingdom to be hard-headed, shrewd, and business-like. Now they seem to be governed by the present-day successors of the wise men of Gotham. The joke of the whole thing is that whilst the decisions of the Manchester City Council seem to be as stable as a weathercock, the members of the present Royal Exchange do not want to go to Piccadilly, but, as we noted a fortnight ago, have resolved to seek Parliamentary powers to enlarge their present premises.

The scheme of the London County Council for the utilisation of St. Paul's Bridge to assist the connection of the tramways north and south of the Thames has now been formulated by the joint report of the Highways Committee and Improvements Committee. The serious part of the proposed scheme is the part of the tramway line between Cheapside and the south side of Cannon Street, of which 243 yards will be underground and 130 yards in open approaches thereto, whilst an underground station is to be constructed at St. Paul's Churchyard. The exact details of this scheme must be carefully watched by all who desire the continued existence of St. Paul's Cathedral. There is no question that it may readily be a very dangerous thing to make this subway and underground station at the east end of the Cathedral, but until definite figures of depth and distance are forthcoming, the exact magnitude of the danger cannot be estimated.

There is something to be said for the point of view taken by the Duke of Rutland in his letter to the *Times* on the proposal for legislation to protect ancient monuments. His lordship writes from the standpoint of an owner of ancient monuments and objects that these should be scheduled and the owners prohibited from selling without permission from an Inspector of Ancient Monuments, " and then if leave to sell be granted, presumably an ' official ' price is to be placed on the said monuments, a price probably one-half that which could be got in the market. Moreover—and this is, indeed, a piece of massive impudence—no structural alteration is to be made in any building scheduled by the body appointed for this purpose, except with the sanction of the Inspector of Ancient Monuments! Fancy my not being allowed to make a necessary alteration at Haddon without first obtaining the leave of some inspector, probably totally ignorant of the requirements of the case!"

It must be admitted that it would be unjust to prevent the owner of an ancient monument from selling it if he could not afford to keep it or even if he wished for any other reason to sell. Nor would it be right that the owner should be forced to sell, as the Duke presumes, at "a price probably one-half that which could be got in the market." That this is to be the footing on which ancient monuments and their owners are to be placed by legisative enactment is, however, pure presumption on the Duke's part. But it would be quite another thing for the State to have the prior option of purchase at a fair valuaion. It is a well-established principle of English law hat any owner of property may be compelled to sell to a railway company, a borough council, or anybody else who can obtain Parliamentary powers, but at a fair price.

It is a little difficult to decide rightly between the ights of property in ancient monuments and the interests of the nation. If the Marquess of Lansdowne says that he is hard up for cash and that he has a picture by Rembrandt for which he is offered £100,000, it is obviously unfair for the State to say, " We won't give you as much as you can get in the open market and you must not sell to anyone else." On the other hand, if every owner of an old master or ancient monument were in a position to oblige the State to purchase his property at present market values, the national debt would speedily be doubled.

We cannot agree with the Duke's objection to the prohibition of structural alterations to ancient monuments without permission. Such alterations have too freuently been made in the past, with the result of great epreciation of the value of ancient monuments, and preumably any Inspector of Ancient Monuments who might e appointed would be an expert who could give sound dvice as to the wisdom and necessity of any structural lteration.

We are rather amused at the suggestions that have een made by the Cardiff City Engineer (Mr. W. Harpur) or the improvement of the acoustic properties of the Council Chamber and Law Courts, and at his opinion that he difficulty of hearing distinctly in the rooms menoned was largely attributable to the ventilating ducts rawing off the sounds, with a confession that he did not see how this was to be avoided. Experiments with uspended canopies, curtains, and Union Jacks seem to e all that Mr. Harpur could suggest. These expedients re palliative in certain cases, but they do not go o the root of the acoustic properties of a room, and from he tone of Mr. Harpur's report it does not appear that e has any great confidence in the result of the experiments he suggests; so that we are not surprised that the ommittee decided, for the present, to adopt only the uggestion with regard to the Council Chamber, and this y way of experiment. The Police Courts and Wreck ourt will remain as they are for the time being.

That trial holes are not necessarily always reliable is fact that many architects have found by experience to e real, and has been illustrated by what recently occurred at Tamworth in carrying out works for sewage disposal. The site was chosen not only because it was convenient for the works, but the subsoil and nature of the land generally were believed to be very suitable for the purpose of outfall works. Trial holes were got out under the direction of Mr. H. J. Clarson, one of the engineers, and these were inspected by Mr. Midgeley Taylor, consulting engineer, and by Major Norton, an inspector of the Local Government Board. The site was approved by the Local Government Board. Sand and gravel were found in the trial holes, but when the contractor commenced excavating for the tanks and filters, to the surprise of everybody concerned, sand and gravel were practically absent.

Dr. Bostock Hill, in his presidential address at the annual meeting of the Society of Medical Officers of Health, touched on the popular idea of the ordinary householder that " the drains " are the alpha and omega of sanitation. He said that the first association in the public mind of the medical officer of health was with what he termed " drain-pipe hygiene." He held that one of the first steps in the urgently-needed public education was instruction in what they now knew to be the real important work of public health. This was rendered somewhat difficult because the public still clung to the old idea that everything hygienically bad was due to sewer gas, and that drains in some way or other were at the bottom of all the sanitary evils which flesh is heir to.

Although it would seem that the erection of the Victorian Government building had quashed the possibility of carrying out the suggestion of the Further Strand Improvement Committee, that body has taken heart of grace from the continued vacancy of the " hole to be let as a sight " and have resuscitated their proposal, backed by a valuation from Messrs. Southon & Robinson, who, on the presumption, which seems justified, that the County Council's estimate of value is excessive, now estimate the value of the land to be surrendered, according to the Committee's proposal, 10,930 square feet, at £93,525, instead of the figures contained in the report of the Improvements Committee of the London County Council, £239,400. To Messrs. Southon & Robinson's valuation must be added the cost of reinstatement of the Victorian Government, but the Committee's proposal is worthy of reconsideration by the London County Council in the light of experience.

A single year's experience of the operation of the Finance Act has most fully justified all the adverse criticisms of its political opponents and of the Land Union. The capital value of all the land in the country has been directly depreciated. Mortgagees have been frightened into withdrawing their loans and refuse to grant new ones. The effect of this tendency is to make it most difficult for builders to carry on their business, and many have been ruined and their workmen deprived of wages. Owing to the suspension of building operations rents are already showing a tendency to rise, especially in the case of small houses and cottages in urban districts. The trouble and expense cast upon land and house owners (especially small proprietors) has been incalculable. After all the work of valuation so far, not a thirtieth part of the whole has been accomplished, and practically no revenue has accrued to the State, while the expenses are enormous. The basis of valuation is admitted on all sides to be utterly impracticable, and a large number of the valuations already made are liable to be nullified as the result of appeals. Nothing but the sheer complexity of the Act keeps it on the Statute Book for a single hour, and the new land taxes are clearly doomed to an early death. The valuation, if ever completed, will be valueless. No one stands to gain sixpence by the Act except those who are paid salaries to keep it in operation—the printers and stationers and the professional men employed to unravel its difficulties.

In connection with Mr. Prior's series of lectures (p. 230) the following charts have been prepared which indicate the general lines on which he will deal with the subject of English Architecture.

CHART I.

CENTURIES.	DATES, A.D.			TITLES.		CHIEF AIMS OF BUILDING.	CHIEF FEATURES OF CONSTRUCTION AND DECORATION.	
VII	600	ROMANESQUE	SAXON	Early or "Anglian"	SMALL CHURCHES. REFUGE TOWERS.	Symbolical stone-carving in relief chiefly upon crosses.	Scroll and knot sculpture.	600
to	to			Mid or "Irish Viking"				to
X	950						Limited attempts at the copy of Roman fabric.	950
	1000			Late or "Wessex"		Planning of small "Parish" Churches with Porches, Transepts and Towers.	Pilaster strips and mid-wall shafts.	1000
XI	1050		ANGLO-NORMAN	Early or "Norman"	ABBEY CHURCHES. LANTERNS.	Planning of great "Monastic" Churches with Lanterns and simple Apses.	Massive unadorned Masonry decorated with painting of Sacred subjects.	1050
	1100			Mid or "Cluniac"		Development of the rib-vault with enlarged Apses.	Sumptuous structures with elaborate painting and rich sculpture.	1100
XII	1150			Late or "Reformed"		Enlarged fenestration with square ended Quires.	Structural simplicity, disuse of decorative carving.	1150
	1200	GOTHIC		Transition		Lightening of fabric.		1200
			GOTHIC	Early English	CATHEDRALS. SPIRES.	Concentration of thrusts. Planning of great Quires with Chapter-Houses and Lady Chapels.	Purbeck-Marble and White-Stone Masoncraft, shafted piers, moulded ornament, functional structure, developed vault, pointed arch, lofty gables and windows, flying buttresses, pinnacles.	
XIII	1250					Development of abutment.		1250
				Mid Gothic		Elimination of Wall. Variety and decorative shaping of construction.		
	1300			Decorated		Elaboration of Chapels, Chantries and Monuments with Screens.	Sculptured ornament, elaborate traceries and vault-ribs, rich colouring, much statue-work.	1300
XIV	1350		PERPENDICULAR	Early or "State"	AL CHAPELS, PARISH URCHES, BELL-TOWERS.	Planning of Royal and Collegiate Chapels.	Development of panelling in walls, windows and vaultings.	1350
	1400						Architectural ornament with detached Statues and decorative painting.	1400
XV	1450			Mid or "Vernacular"		Planning of great Parish Churches with Aisles and Chancels, and Guild-Chantries.	Repetition of detail, variety of local use, advance of Carpentry, elaboration of wood ceilings.	1450
	1500					Planning of Colleges and adaptations to	Lowerings of Arches, flattening of Ceilings, disuse of Tracery.	1500

600	Borrowed motives of sculpture	OFF-SHOOTS FROM	The Arts of the East	MISSIONARY	Greek Ecclesiastics with Greek Artisans	"CONVERSION,"
to	Decadent execution with barbaric motives		The Scandinavian Arts			
950	Elegant Masoncraft with non-constructive fabric		The Othonian Renaissance		Native Ecclesiastics with Native Artisans	466 years to
1000			German influence			
1050	Constructive vigour of Masoncraft	PART OF THE CONTINENTAL ART.	Sharing in the Monastic developments of the Arts in North-West Europe	ECCLESIASTIC	Norman Ecclesiastics with imported Artisans	"CONQUEST," 1066.
1100					Anglo-Norman Ecclesiastics with Native and Foreign Artisans	
1150	Gradual emancipation from Classic origins First in structure		In alliance with West France		English Monks and Bishops employing and organising travelling Masons	142 years to
	Then in ornament		In alliance with the Architectural development of North-East France			
1200	Direct exhibition of construction with ornament taken from natural subjects worked in the fabric of the building	INSULAR BUT IN TOUCH WITH FRENCH	Rejecting French forms of detail		Churchmen as Clerks	"INTERDICT," 1208.
1250			Admitting French forms of detail	MECHANIC		
1300			Creating forms which reacted on French style		Masons as Builders	141 years to
					Kings and Nobles as Employers	"BLACK DEATH," 1349.
1350			100 years war			
1400	Gradual overlay of construction by constructional ornament with detached sculpture and accessories	INSULAR & INDEPENDENT OF CONTINENT.		CORPORATE (GUILDS)	Masons under Officials

1500					Masons under Squires and Merchants	190 years to
1550			Flemish and Italian influences		Masons independently contracting with all Classes	"DISSOLUTION OF MONASTERIES," 1539.

ENGLISH MEDIÆVAL ARCHITECTURE.—I.

THE Carpenters' Company have again arranged a course of public lectures on architecture at University College, Gower Street, W.C. This year the course is to be given by Mr. Edward S. Prior, F.S.A., F.R.I.B.A. The opening lecture took place on Thursday, October 12.

Mr. Prior explained in his introduction that he proposed to deal with the architecture of mediæval England on the side of style and construction—as a series of facts in style and as a series of developments in building, rather than as a great drama or romance. The word "style" in art was often used as an indefinite summary of merit, as if it labelled a distinct essence only distilled by the magic process of genius. Various definitions had been promulgated to include English examples of Romanesque and Gothic in the roll of honour understood by those titles. But those examples cannot be walked around, measured, and specified as if they were objects in three dimensions. Romanesque and Gothic were rather progressions than things; as it were, cavalcades of the arts dancing in one long company, winding this way and that, but with the light of a great purpose always in their eyes. That purpose—the ideal of church-building—made the spirit of their art, and it is now extinct. The production of the modern stylist, however exact to definition it may be, is only a stage effect, for it cannot revive the original passion.

Mr. Prior said his point was to regard "style" as an historical and local fact, not as an abstract expression of idealism. In the former sense it is a selective catalogue of features, a surface estimate of the result of forces and actions in building for the length of time when such forces and actions remain comparatively stable. When there comes a revolution or a crisis new forces emerge, a new surface estimate of their effects has to be made, and a new style is conceived. Style may be called the summary of an architecture as an art; but underlying this there are the constructive habits of that architecture which may be called its summary as a science. It is this science of construction which puts its life into the style and serves as the drums to which architecture marches. Yet, like a deceitful cloak, style may misrepresent the facts of construction.

Styles not only differ by the differences of the constructive habit, but also in the degrees in which they clothe those various facts—either exhibiting them and disclosing their structure, or overlaying them and hiding that structure under adventitious ornament. The chief aims and the chief qualities of building varied during the several great eras of mediæval architecture in this country, where each stretch of twenty years developed fresh aims of building, fresh qualities of style.

Among the various great architectures of the world, that of the mediæval artist shows itself as most closely fitted on construction. It exhibited throughout the anatomy of building directly. In other words, the art of the Middle Ages lay immediately in its science of construction.

This prime distinction must not be put on too narrow a basis, for the building art is a complex thing, with many ideas and conditions contributing to its activities, and with many requirements which must be met before the efficient building is produced. The joint dependence of architectural expediency on both the material and the spiritual conditions exhibit its life. Form appeared to the builder as immediately developed out of the building, as a necessity created by material. At first the relations were very simple; later they grew complex. But there is no break in the continuity of Romanesque and Gothic, for Romanesque was always Gothic in the making, and Gothic was always Romanesque carried on to the ornamental solution of the problems that Romanesque started to solve. It is for the purposes of survey alone that the pageant of mediæval style must be divided up into sections.

The Continental method of dividing architecture into centuries makes bad categories of English style compared with the descriptive terms of Saxon, Norman, &c., given by Rickman. The mischief of the latter has come from the desire to make periods of style where Rickman only indicated divisions. For example, the Revivalists stretched the term "Decorated" to cover with a special glory all the English architecture from 1260 to 1360. In view of this particular misuse, Mr. Prior suggested a middle term, like "Mid-Gothic," between "Early English" and "Decorated." Such nicknames as "First pointed" or "Lancet" are trivial, since architecture was considerably more than the shapes of arches and windows, and no correctness or canon of proportion was possible in mediæval building. The grouping of forms together as necessary to one another is alien to the mediæval spirit, and to make a "correct" architecture out of it was incorrect. Experiment—that is to say, rejection of canon—made the life of mediæval architecture; there was a habit and custom of masonry, but never a canon of art.

The essential fact was growth by experiment. But in this experiment the central idea upon which it continually turned may be noted, and also a series of secondary ideas succeeding one another and superseding the previous expressions as the course of architecture proceeded. The central idea which was responsible for mediæval architecture was stated by Mr. Prior to be "the building of a hall of a particular kind—that is, a church which should endure, a church that should be the largest, the most open, the best-lighted—in a word, the most convenient for the purposes of a collection of people for worship and ceremonies sheltered from the weather." One of the specific creative conditions was that the church should be rendered fireproof by being roofed in stone. Stone itself was a precious thing, owing to difficulties of carriage. It had to be conveyed in small pieces, and usually by water. Yet with these small pieces of stone the large churches demanded by religious fervour had to be built and vaulted. Thus the working principle of mediæval architecture modelled itself into the aim of working stone so as to spread it to cover the biggest spaces with the least material. Masonry became a fibrous webwork of little stones, each piece functioned to take its part to the utmost in the enclosure of space. Stone was the jewel, and in its cutting the art of the cutter had to be magnified. Step by step Gothic moulded secondary (or decorative) features of style out of its construction, until the functional offices of stone sculpture began to lose their purity, and finally became lost altogether when classical learning deemed that the elements of form were not building expediency but classical taste.

There seems to be no ground for supposing that either the rejection of Classic and Byzantine forms in Romanesque, or the creation of mediæval details, was due to artistic efforts or to fancies in designing, or to any theory of the beautiful. The extraordinary massiveness and unadorned simplicity of Anglo-Norman building, argued Mr. Prior, are traceable to the wealth of the Benedictine Order, the assistance of large bodies of Saxon serfs uneducated in masoncraft and capable only of walling in great masses, and also to the desirability of large, plain surfaces for the monastic painters. The square east ends and unadorned fabric of the Transitional Gothic grew not out of design but out of the poverty of the reformed monks. The shafted piers of Early English and its multiplied mouldings were the result of small pieces of Purbeck marble and Caen stone only being available. The wide windows of English Decorated arose out of experiments in filling the large east walls with the least stone. The Perpendicular repetition of oblong upright panels covering walls and windows seems just like a shop-device of a firm who had to cheapen monuments.

In the concluding part of his lecture Mr. Prior discussed the Continental relations with English architecture, and the personality of those responsible for the forms which architecture took. Pre-Conquest architecture was in the hands of missionaries whose connections were at first immediate with Eastern Christendom. Upon the Conquest, Romanesque building became cosmopolitan, thanks to the Benedictine domination; later, the Austin Canons and the Cistercians supplanted the Cluniac influence. The third chapter of the English art was put at from 1200 to 1349, when the position became reversed and Normandy began to learn from England. The final chapter, after the Black Death, Mr. Prior labelled as distinctly insular and peculiar to England. The existence of authoritative designers in mediæval building-craft must, he contended, be open to the utmost doubt. The religious caste and the mechanic class may be both justly entitled the authors of the buildings of the Middle Ages.

THE ARCHITECTURAL ASSOCIATION.

A COMBINED ordinary general and Camera, Sketch and Debate Club meeting of the Architectural Association was held at Tufton Street on Monday last. Mr. Gerald C. Horsley, F.R.I.B.A., President, occupied the chair.

It was announced that the next meeting of the Camera, Sketch and Debate Club will be held on November 2 (Ladies' Night), when a paper is to be read by Mr. Edwin Gunn, A.R.I.B.A., entitled "Woman as a Domestic Architect." The Athletic Club will hold their annual general meeting on October 24. The President read out the names of thirty-five candidates for membership, all of whom were duly elected; also the reinstatements of Mr. A. E. Richardson and Mr. C. L. Gill. A vote of thanks was passed to Miss Nicholl for presenting to the A.A. two model roofs and some pieces of nediæval woodwork and ironwork. Mr. F. C. Eden was nominated to fill a vacancy on the Council.

Mr. Arthur Keen, F.R.I.B.A., Treasurer, proposed the adoption of the balance-sheet and Council's report for ession 1910-11. This was seconded by Mr. W. Curtis Green, and carried.

A vote of thanks was carried with much applause to Mr. D. G. Driver, the Secretary, and his staff for their work.

Mr. Raymond Unwin then read the following short paper, ntitled

Town Planning: Formal or Irregular?

The subject of the discussion which you have done me the honour of asking me to open to-night is one both deep in ignificance, for it goes to the root of all town planning design, and difficult of solution, for it opens up the whole problem of convention in art, as to which a controversy as ld as art criticism has invaded every form of design from portrait-painting to gardening. I am not qualified to deal conclusively with so wide a subject, nor do I feel able to put efore you a simple advocacy of either the formal or the rregular in town planning, which perhaps might have been he easiest way to open a discussion. If we were to interpret he two views in such terms as some of the extremists on each ide make use of it would be fairly easy to put a strong case gainst either party. Those who say that the town plan hould consist entirely of straight streets and square places ymmetrically arranged upon an axial line, pretty obviously gnore both the economic necessities and the great architecural opportunities which spring from the fact that the site pon which the plan is to be carried out has in England, in ine cases out of ten, an undulating surface, and contains many marked features of an irregular character. On the ther hand, those who maintain that because the site consists f hills and hollows, and is marked by winding streams and evious highways, uplands with ragged edges, and the andom boundary lines of private properties, it is therefore nnatural and out of harmony with the site to plan straight treets or lay out symmetrical groups of buildings, seem, on he other hand, to neglect altogether the legitimate function f human design and the application of architectural priniples natural to a work so intimately connected with archiectural expression as that of town planning.

Unless the extreme formalist is prepared to depend upon igantic feats of engineering to provide for him a sufficiently ormal stage for the display of his design, however formal he may make it on the paper plan, many sites will play unexected pranks with the lines of his elevations. In fact, we annot, if we are to obtain any success, think of town planning s the creation of a pattern in two dimensions, but must ecessarily think of it in three. The formalist will admit hat on an undulating surface many of his straight lines will lways be seen as curves, and I cannot conceive any valid eason why he should not curve these lines on plan if by o doing he can secure a horizontal line for his elevation—a matter which may be of vital importance to the formal effect e aims to produce.

This line of argument seems to give an opening to the dvocate of the irregular school to come along and say: What is this formalism and symmetry, anyway? Is it nything but a mere conventional rule to make it easy for he unimaginative mind to produce harmless designs? What ossible justification is there for limiting the design to the ymmetrical, the straight, or the square?" He has studied he lines which have pleased him in the world around, the weep of the seashore, the outline of the mountain slope, and he subtle forms of leaves and flowers, as seen foreshortened n their natural state, and has found no formality. True, he ust admit some degree of symmetry in the balancing of parts f the bodies of men and animals, but he will urge that this s always associated with an extreme degree of subtle odelling with some inexactitude, and that the symmetry of odily form, except, perhaps, when laid out in death, is lways modified by the want of symmetry of the pose in which t is seen.

If, on the strength of this, he argues, "Why should I not ave for my design the same freedom that I see in these orms around me?" I am not sure whether here we have not tumbled on the essential fallacy of this point of view, the dea that the free exercise of fancy uncontrolled by any preision of purpose or law of proportion is the natural basis or the highest type of design in all branches of human ctivity. John Ruskin is not always accepted nowadays as safe guide in all matters of architectural art, but I should ike to quote what he says about that idea of liberty which regards it as meaning the right to do what we like. He says in "Seven Lamps":—

"Nor is it the least among the sources of more serious satisfaction which I have found in the pursuit of a subject that at first appeared to bear but slightly on the grave interests of mankind, that the conditions of material perfection which it leads me in conclusion to consider furnish a strange proof how false is the conception, how frantic the pursuit of that treacherous phantom which men call liberty—most treacherous, indeed, of all phantoms, for the feeblest ray of reason mighly surely show us that not only its attainment, but its being was impossible. There is no such thing in the universe. There can never be. The stars have it not, the earth has it not, the sea has it not, and we men have the mockery and semblance of it only for our heaviest punishment."

I would like further to suggest that in the alternative definition, first given, I believe, by James Hinton, "that liberty is the power to like what we may do," will be found some reply to the extreme informalist. Certainly a good deal of what may be seen of informal town planning and *art nouveau* architecture does support the view that in the studied irregularities some of the designers are parodying the lines of a nature which they do not understand, and caricaturing a type of beauty which their art is incapable of creating. But because of this, to maintain that no one is competent to compose, either in the form of buildings or in the field of town planning on a non-symmetrical line, that the beauties of proportion and relation can only be displayed when axially planned, seems to me a proposition which is amply disproved by many of the most beautiful buildings, streets, and places which have resulted from the work of the greatest periods of the past.

But our discussion is approaching that most unprofitable point of trying to decide one of those never-to-be-settled problems as to how far we may sway towards one view or another, the extreme and logical outcome of each of which we feel to be unsatisfactory. To avoid this danger I suggest that we try and approach the subject from another point of view. Past generations have not been able to solve the problem on these lines. It is hardly likely that we shall do so to-night, but if we can by discussing it help one another to see more clearly what should guide us we may glean some practical good from the discussion.

What is town planning? What constitutes it as an art, and what limitations must artistic expression through this medium accept?

Town planning consists in making provision for the needs and affording satisfaction for the aspirations of an organised community. It is its purpose to minister to the convenience of the inhabitants, to increase the efficiency of their associated industrial and commercial activities, to foster their social intercourse and their intellectual development by the facilities which it affords, and to add to the pleasure of their lives by preserving the amenities of the town as a place of residence. This is, in mere outline, the useful function which town planning must fulfil. The very expression of some of its purposes would constitute town planning an art, and it is impossible, as in the kindred art of architecture, to draw any precise line between the useful purpose and the beauty of the form adopted to satisfy that purpose, the two being intermingled. If properly appreciated both by the citizen and the artist, these two aspects of the subject are not antagonistic, but they may become antagonistic if the artist forgets the purpose of that which he is creating and imagines that it is his duty to create something beautiful which the citizens may with an effort make use of, instead of creating something useful and expressing it in a beautiful form.

Here at once we meet with definite limitations of a practical nature within which the designer must work. It may be true that the steep, straight street leading over the top of the hill would make an excellent basis for a formal scheme, but if every cyclist has to dismount and push his machine up that hill, and every driver to walk his horse with difficulty down the other side, the purpose of convenient access will hardly have been satisfied, and any beauty which the design may have will be rendered unpleasing by its obvious want of suitability to its proper purpose. We see, therefore, that our plan, whatever its form, must properly satisfy the requirements of use, and must be adapted to the nature of the site. These may be taken as two cardinal principles of successful town-planning design, principles which are sufficiently important to overrule any mere question of formality of plan when they are antagonistic to it. Though these practical considerations will often be irreconcilable with some preconceived formal scheme, it is not often that they will be antagonistic to all forms of beautiful expression. Much has been written on the relation between use and beauty, and I must not wander off into a discussion on this point. Suffice it to say that in town planning, at any rate, beauty is intimately associated with use, with fitness for purpose and function, but it is not the same thing. It is not enough to satisfy the use and trust that by chance beauty will result. Use and fitness will dictate certain lines of development, but it is seldom that these will be exact lines; rather they will be limits of deviation, and it is within those limits which the useful purpose allows that the town planner must keep, and it is of the scope which they afford him that he must take advantage to produce the beauty of form at which he is aiming.

But not only are there limitations due to the useful purposes of town planning; there are, as in other arts, limitations due to the medium.

First of all, this art is not complete in itself. The town planner but lays down the general design, creates the opportunities. He must depend upon the architects who come after him to fill in the details and take advantage of the opportunities he has created. He will be able to a greater or less extent to influence the result by determining the position of main buildings, and sometimes by fixing frontage lines and limiting the heights and character of the buildings; but at best he must leave all detail out of his count; he can deal only with the main masses. It is by the handling of these masses of building and the disposition of the spaces or voids between them, by bringing all the masses and spaces into proportion with each other, and the whole into proper relation to the site so as to produce an organic composition, and by this alone, that town planning can speak, can produce its effect. It is by the completeness of the organic composition also that town planning gives expression to the ideas of corporate activity, civic association and human fellowship, a range of ideas which can hardly, with equal adequacy, be expressed in any other way.

If that be so, then our artistic aim proves true when brought to the test which Mr. Reginald Blomfield has well suggested when he says in "The Mistress Art":—"This is, I think, the vital touchstone of any art that what it does can only be done by that one particular art."

Anything, then, which contributes to the force and clearness of this expression of the organic unity of the city must be proper to the practice of this art, while anything that detracts from or blurs this expression must be improper. It is by appealing to the sense of correlation which springs from spacing and proportion, to the sense of unity which springs from definitely apprehended form, whether in plan by the disposition of the parts upon a level plain, or in elevation by the piling of them upon the hillside, that alone we can produce this our highest form of expression. We are seeking definiteness of form; it can hardly be right to take informality or irregularity as our means.

To sum up, I believe, then, that town planning should be formal, using the word in a broad sense and always remembering that there are limits set by the useful purposes that the plan must provide for, by the nature and opportunities afforded by the site, and by the relation of the beholder to the city which he views, all of which will very often cause the essential effects to depend upon a formalism which does not hesitate to depart from exact regularity on the paper plan, when by doing so more adequate expression can be given to some element of the design more essential to the complete unity of the result than the element of formality.

In conclusion a number of examples were shown on the screen illustrating what Mr. Unwin had been advocating in his lecture. The slides were chiefly from continental cities, with a few from the United States, and occasional examples of the adaptation of the principles to English garden suburbs.

(*To be concluded.*)

ST. PETER'S CHURCH, HARROW.

THE foundation stone of the above-named new church was laid on Saturday, October 14, by Lord Ashcombe.

The new church will be built from the designs of Mr. Geo. H. Fellowes Prynne, F.R.I.B.A., of Westminster. The architect has chosen a free treatment of the Decorated style of architecture. Externally, the church will be simple but effective in character. As both the east and west ends are comparatively hidden from view, very little elaboration of detail will be needed.

The western entrance porches will be placed on either side of an apsidal baptistery, other entrances to the church being placed at the west end of the north and south transepts. Separate entrances are also arranged for the chapel and vestries at the east end.

The plan consists of a nave, 84 feet long by 30 feet wide, divided into five bays, giving accommodation for 450 right in front of the chancel. As before stated, a baptistery flanked by two large porches is placed at the west end. North and south lean-to aisles are placed against the three western bays of the nave arcade, and transepts are thrown out from the two east bays on either side. The north transept wil form, as it were, the nave of the side chapel.

The chancel, which is 39 feet long by 27 feet broad, give accommodation for forty-four, including clergy and choir and room for a dignified sanctuary. The altar is raise five steps from the chancel and nine steps from the nav floor level, and considerable space is allowed on the eas wall, above the altar, for a future reredos or dossal hangings so that the whole effect may be more spacious.

Side passages are placed on either side of the chancel fo returning communicants, and large arches open north an south, giving a view of the east end from the side seats i the church.

Over the passage on the north side a partly-hidden galler will be constructed as a musicians' gallery, the organ-chambe being placed on the opposite side over the vestries. A larg choir vestry opens upon the side chancel passage, which als connects with the clergy vestry and sacristy, and a separat porch and lavatory are arranged for. The roof will b barrel-shaped, which, from an acoustic point of view, i found to be the best form of roof. The nave and chancel wi be carried to one level, the apex being about forty feet fro the nave floor level.

The chancel arch will be carried to the whole height the nave roof, a screen and rood beam being placed withi the arch. The builders are Messrs. Webster & Cannon, Aylesbury, whose tender for the complete work was £8,18

ILLUSTRATIONS.

THE COUNTY SCHOOL FOR BOYS, BROMLEY, KENT.

WE recently illustrated the plans and gave a gener description of the design which was placed first the assessor, Mr. John Bilson, F.S.A., in a limited con petition, and reproduced Mr. Burke Downing's drawing fro the Royal Academy Exhibition. To-day we are able to illu trate the executed work. The school was formally open on Wednesday, the 18th inst., by the Deputy-Lieutenant the county.

The elevations of the building generally are of purpl brown Crowborough bricks and Lawrence's red bricks. T stone throughout is Portland, and the roofs are cover with dark red tiles.

Messrs. R. Cook & Sons, of Crawley, were the contracto and the sub-contractors include the undermentioned firm Heating and electric lighting, Messrs. Strode & Co.; ste work, Messrs. Dorman, Long & Co.; sanitary fittings, M T. Harris, of Blackfriars; wall tiling, Messrs. Martin V. Straaten & Co.; fibrous plasterwork, The Veronese Co. T wrought-iron work was executed by Mr. S. Norbett, Maidenhead, and the stone-carving and modelling by M F. Brooke Hitch, of Vauxhall. Mr. W. Rees Roberts w the clerk of works.

The architect is Mr. H. P. Burke Downing, F.R.I.B. of Westminster.

DONIBRISTLE, FIFE.

LITTLE remains of the original house of the Earls Moray, and the blackened ruins bear witness of t overwhelming flames of 1858. The kitchen and servan wings, being detached from the main block and on a low level, however, escaped, and it is between these two win that the magnificent stairway is constructed. It has exc lent iron railings and is closed by a beautiful wrought-ir gateway in which the initial "M" figures conspicuous The ironwork dates probably from the latter part of t seventeenth century, and is of Flemish workmanship and supposed to have been given by William III. to Anne, wi of Charles, sixth Earl of Moray. A proof that the raili was not of local make is that the standards in the raili below are not central with pilasters. The ironwork painted white, giving an excellent effect, and nearly t whole is in exceedingly good preservation.

The drawing by "Doric" from which our illustrati is taken was awarded a prize in *The Architect* Studen Sketching and Measuring Club.

SIR JOHN SOANE, R.A., F.S.A., &c.

(Concluded from last week.)

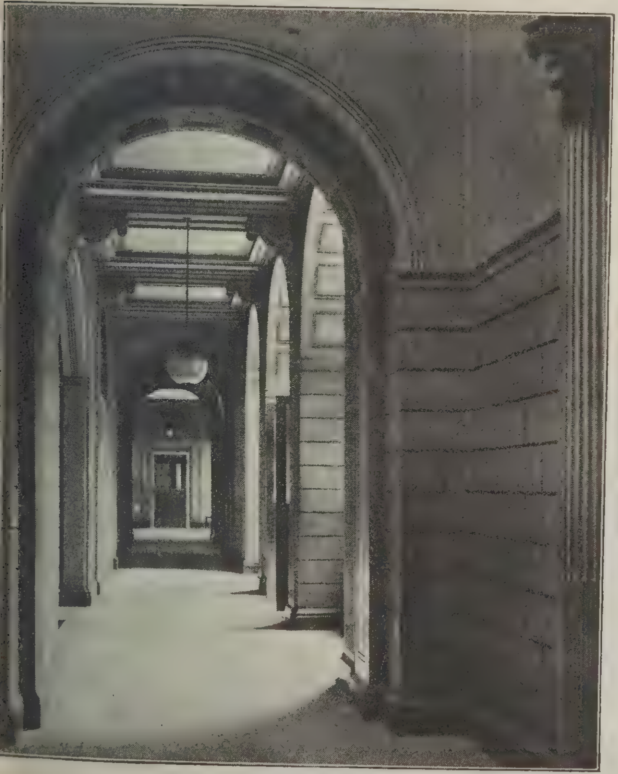
THE death of Sir Robert Taylor, architect to the Bank of England, in 1788, created a vacancy for which there was keen competition. Through the assistance of Lord Camelford, however, Soane was eventually appointed architect. He was very bitterly criticised and made the object of a number of malignant satires in the Press, instigated, doubtless, by the disappointed applicants. Upon commencing his duties he made a thorough investigation of the building, and especially the Rotunda, in conjunction with Messrs. Milne and Dance. In issuing the report they described this latter as being constructed mostly of timber and advised its entire reconstruction in fire-resisting materials. This was eventually done and commenced a long series of alterations and additions which lasted for forty-five years.

Some little history of the Bank of England would perhaps be of interest to those who may not be acquainted with it.

The original foundation dates back to 1691, when a National Bank was projected by William Paterson and Michael Godfrey. The Company started in 1694 with a capital of £1,200,000, lent to the State at 8 per cent. interest, and an annual subsidy of £4,000. The first Governor, Sir John Houblon, had carried on the transactions at the Mercers' Hall prior to this date, and the Grocers' Hall was thereafter occupied for this purpose until 1734, when they moved to the new premises in Threadneedle Street, built by George Sampson on the site of the house of Sir John Houblon.

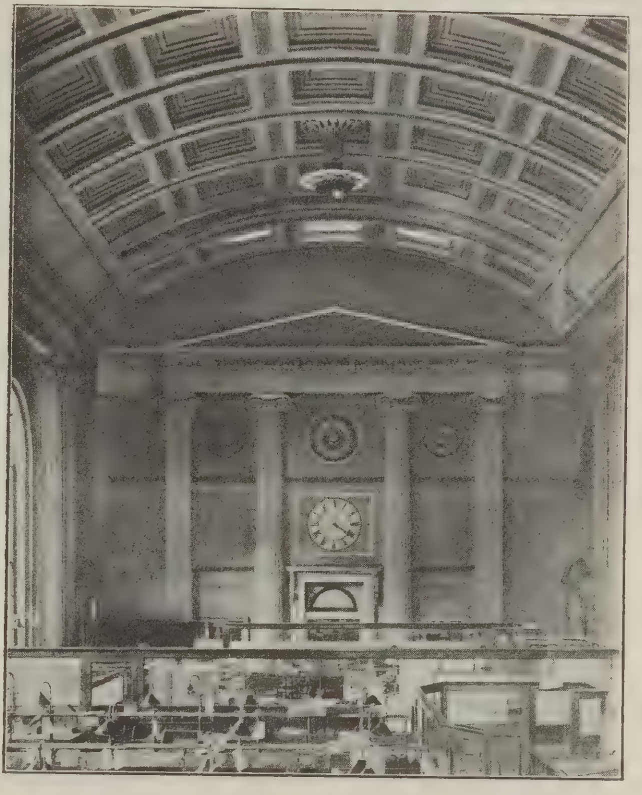
A plan in the Soane Museum shows the entrance into a large court giving access to the Hall, behind which were the directors' and committee rooms, the main staircase and a smaller court (now the Bullion Court), giving exit to Bartholomew Lane. On the west side of this court the drawing and secretary's rooms were situated, and in the rear a large accountant's room, 56 ft. by 28 ft., with necessary staircases, offices and yard.

The façade in Threadneedle Street was of Palladian design, having a rusticated basement supporting Roman Ionic columns for two storeys, the lower having pedimented windows and the upper framed squares in ashlaring. In 1766 Sir Robert Taylor was appointed to make additions to he east of the Bank on the site of the Crown Tavern and Sun Fire Offices, as far as Bartholomew Lane. Subsequently in 785 he repeated this design on the west side of Sampson's açade as far as Princes Street, demolishing the church of St. Christopher-le-Stocks, which stood on the site, to make way for the new Drawing offices and a Court room which were built on three sides of a garden, part of which was formerly the grave-yard of the church.



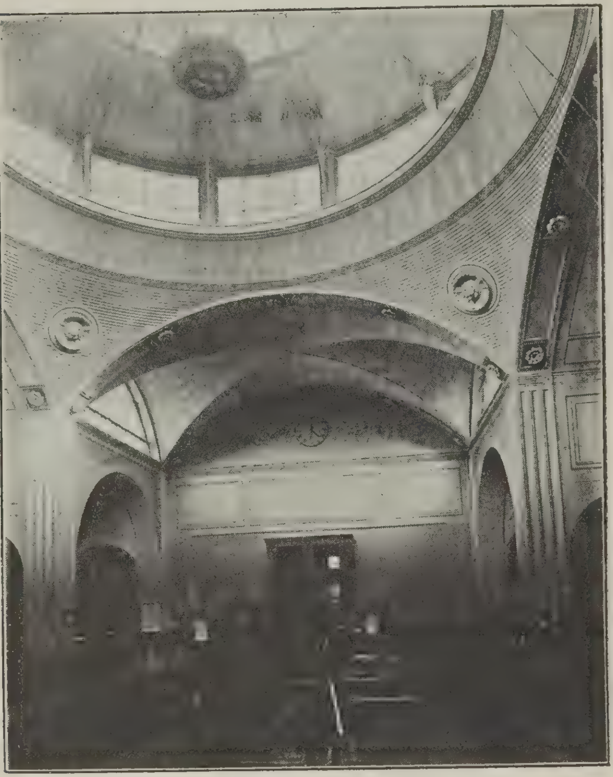
BULLION COURT CORRIDOR, BANK OF ENGLAND.

The Threadneedle Street front had a light Corinthian order to a single storeyed building flanked by pediments, which is said to resemble the garden front of the Pope's Palace in the Vatican. As I have said, the design was repeated each side of Sampson's centre block, but the order adopted by Taylor is shorter and lacks the boldness of Sampson's design, giving almost too much emphasis. There were of course no external windows to these wings, with the exception of Sampson's façade; all lighting was, and is now, obtained by means of internal courts and lantern lights.



PUBLIC DRAWING OFFICE, BANK OF ENGLAND.

The first works executed under Soane's directions were additional accommodation at the north-east corner, bounded by Bartholomew Lane and Lothbury, for which purpose the houses occupying the site and forming Katharine Court, Bishop's Court, Joiner's Court and Falcon Court were demolished, and the Stock office, Library, Consols Transfer office, Lothbury Court, &c., were built upon the site as far as old Princes Street. The next step required more serious consideration, viz. the widening and straightening of Princes Street, which, with the younger Dance's suggestions, was considered before a committee of directors. Eventually the Grocers' garden was pierced through, and a screen wall erected in keeping with the wall of the Bank in Princes Street (south end) for the protection of their premises, thus completing a homogeneous design for the length of Lothbury and for half-way up the two side streets. The reconstruction of the Rotunda and adjacent offices in 1794 was executed in fire-resisting materials, consisting of bricks, terra-cotta, &c., bound together at regular courses with wrought iron rods. The terra-cotta bricks were bottle-shaped cylinders 7½ inches long and 4½ inches each way at the top; these were packed closely together and cemented, commencing at the haunch, up to which point the work was in brick, the holes formed by the meeting of the discs on the soffites making a good key for the plaster. All the constructional sheets for this and similar work are most carefully executed, and in the case of the Bank Stock office an elaborate central system of heating is arranged, by which the flue is taken from the central stove horizontally in serpentine fashion under the floor area before being discharged up the stack constructed in the wall. The Rotunda lantern light is supported by a single row of caryatides like the 3 per cent. Consols Transfer office built in 1797. The finest of these domed rooms, however, is the Dividend office with its caryatides in pairs, while the 5 per cent. office of Taylor's time was rebuilt as the 3 per cent. Reduced by Soane in 1817, with a row of fluted Ionic columns supporting the skylight. The other variations to this system of lighting are to be seen in the Bank Stock office, which has ornamental iron cantilevers, and the accountants' office (now called the Public Drawing office), which has a curved ribbed and coffered ceiling. The ornament is always sparing with an absence of mouldings or cornices. Beads and parallel incised lines ending in some combination of the Greek fret pattern are characteristic of Soane. The treatment of the wood panelling at the back of the Dividend office is very similar to the joinery at the Insolvent Debtors' Court (which by the way is now being demolished). Where his pendentives would not work up naturally from a semi-circular arch Soane was bound to mark the springing with a moulding, and I think this is most successful in the Consols Transfer office, where a lion's head is to be seen at intervals on the fascia. This is a feature also adopted for the cornice to Praed's Bank, 189 Fleet Street (now occupied by the London City and Midland Bank). Pateræ, sculptured plaques, and the caduceus were other favourite means of expression where ornament was desired.



BANK STOCK OFFICE, BANK OF ENGLAND.

In 1800 Soane made an entirely complete design for the whole exterior of the Bank of the same design as the Lothbury front. In consequence of this project an Act of Parliament was passed to enable the directors to increase the working area. In the report submitted with the designs, Sir John had remarked that the exterior elevations represented "a great mass of heterogeneous, unconnected and discordant parts." The work was not, however, put in hand until nearly twenty-five years later, in the reign of George IV. From 1808-10 the five houses forming New Bank Buildings in Princes Street were designed and erected, which are now destroyed. I managed to secure a plate before the second half was pulled down, and this shows a truss adjoining the centre attic storey which is not shown in the drawing in the museum; it adds a very graceful finish to the skyline. The projection with two insulated Ionic columns was repeated at the other extremity. In the rear of these buildings were Thellusson, Nephew & Co.'s premises in Meeting House Court, and the National Debt and Redemption offices, in Old Jewry, contained the cenotaph of the Right Hon. William Pitt, all of which are now removed, but models are to be seen in the museum. Lothbury had to be widened for these additions at the expense of the Bank, Finsbury Pavement not being formed parallel to Coleman Street until a much later date, although Soane had repeatedly urged the advisability of so doing.

The Jubilee of George III. in 1810 was celebrated by illuminating the Threadneedle Street front to a design by Soane, which is to be seen in a lithograph at Lincoln's Inn Fields. Subsequent alterations include the redecoration of the Parlour Library, the gutting and redecoration of the Private Drawing office by C. R. Cockerell in 1836, and the adjoining room in 1849. The lantern in the Residences Court next the Lothbury exit was added by Mr. Blomfield, and the south front attic is the work of Mr. Wyatt Papworth in 1850.

Soane used the order from the Temple of Vesta at Tivoli for the south front and the Lothbury Court, and he was undoubtedly influenced by Hadrian's Villa and the Arch of Constantine and other Roman buildings for many of the features in the Bank.

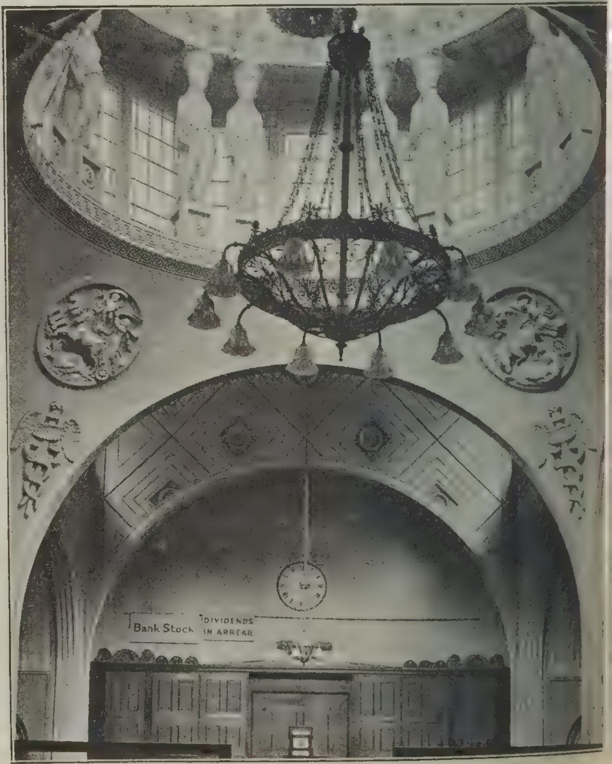
The lineal boundary of the Bank is 1,460 feet, mostly blank wall; there are nine open courts, and the barracks, printing rooms, &c., are situated in the north-west corner of the site. The basement is of course mostly occupied for storage of bullion, coin, notes, bills, and other securities.

When going to the City to-day we are in the habit of passing the Bank as thoughtlessly as any other building, without reflecting on the forty-five years' thought Soane put into it. It was his hobby if you like—his life's work I prefer to consider it—and one that will live in the memory of many when its fellows have passed away. Soane would appear to have anticipated the predicted fall of London, for he prepared an elaborate perspective of the Bank in ruins—eccentric, you say, certainly, but it is built as few other buildings are built in London; built to make ruins, such as are explored in Rome now.

Colonel Graham's house, No. 12 Stratton Street, and the stables to 49 Grosvenor Square, the Countess of Pembroke's house, erected for Robert Knight, Esq., in 1818, illustrat the Soane brick cornice which is his hall mark for this clas of work. You may see the same thing to the garden wall a the back of 12 and 13 Lincoln's Inn Fields, in the mew behind.

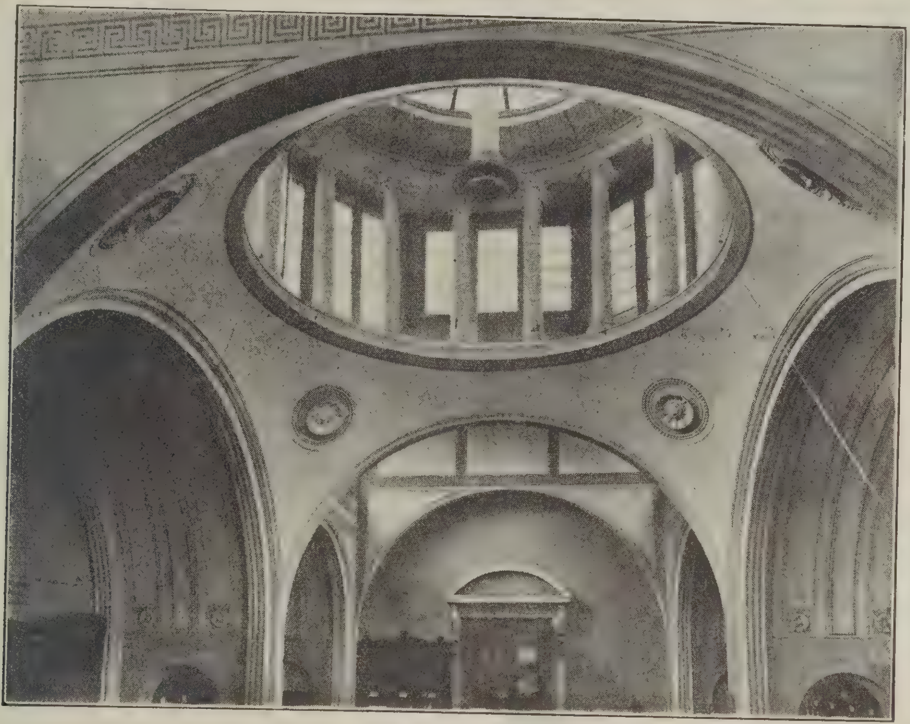
And now I must draw my paper to a close, without takin up more of your time, with a brief description of Pitzhange Manor House, Ealing, Soane's country residence.

This estate was purchased by Soane in July, 1800, fror the executors of Jonathan Gurnell, the house and land cover ing twenty-eight acres, and is situated near Ealing Broad way, in what is known as Walpole Park, which, on the deat of Miss Frederika Percival, in May, 1900, passed into th hands of the Urban District Council of Ealing, and is no being used as a library. The Council purchased the estat from the son of the Right Hon. Spencer Horatio Walpole and it is fully described in a little handbook written by t present borough engineer, Mr. Charles Jones, entitl "Ealing, from Village to Corporate Town." There a several views of the house and interior, including a ceili of a portion built by Dance while Soane was with him.

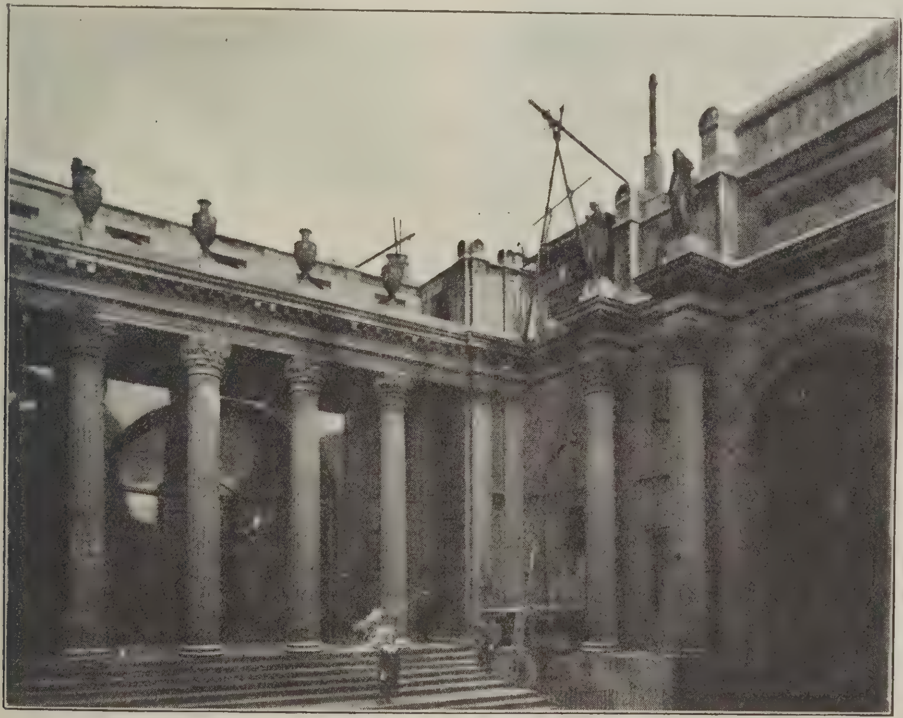


DIVIDEND OFFICE, BANK OF ENGLAND.

In rebuilding the portion for his family Soane retained me of the old work for the sake of associations, although, says, he found a conglomeration of buildings "too deficient symmetry and character to distinguish the work of an tist from that of a speculative builder." There is a legend t during the excavating of a portion of the north side he nd the ruins of an ancient building, which so interested ne that he had it measured and drawn, and restored as uin to form a curiosity for his visitors to view. The end says it belonged to a pious monk, well-endowed with world's goods, who passed his days here in the exercise aritable deeds.



COLONIAL OFFICE, BANK OF ENGLAND.



LOTHBURY COURTYARD, BANK OF ENGLAND.

he villa has a front somewhat similar to the Arch of tantine, a combination of which Soane was particularly having insulated columns, each surmounted with a similar to those in front of the Temple of Pandrosus, at Athens, and the panel under each window contains a wreath of oak encircling an eagle, copied from an antique from Santi Apostoli, in Rome. A similar motive surmounts the entrance gates to the residence, the piers of which are built in flints.

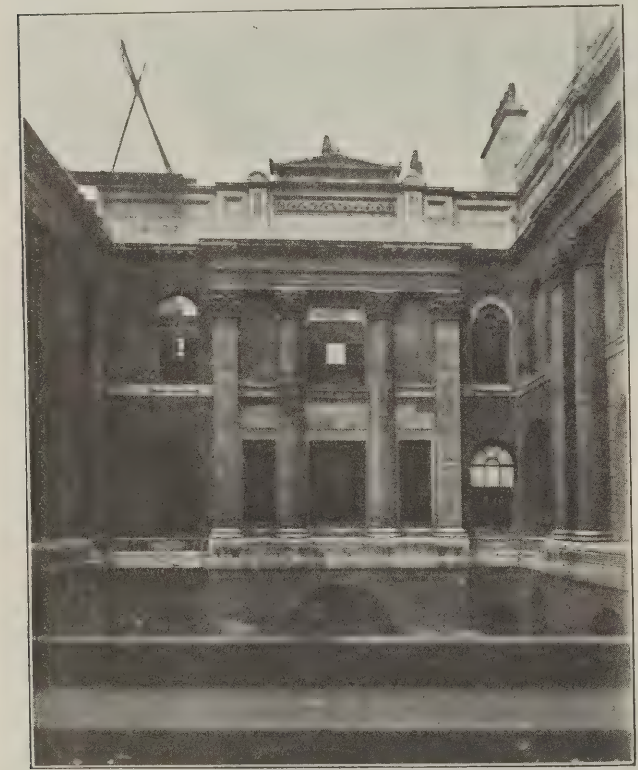
About this time Soane erected the cross or obelisk in the Market Place of Reading for E. Simeon, Esq., the plan of which is a concaved triangle, and it terminates at the top with his favourite feature of a dome-shaped block, having the sides cut off as segments. There is a house at the end of West Street, Reading, built by Soane, which was one time in the occupation of Mrs. Slocombe.

Soane fell out with Wyatt over the additions to the Houses of Parliament on more than one occasion, and it would appear that a life-long feud existed between them; it is curious that he should have married a Wyatt, had a pupil of that name, and an enemy at the same time, apparently three distinct families.

George Wightwick has summed up Soane's work in a very good article, entitled the "Soanean Episode," which he thinks to be an "essential passage in the progress of architectural taste. . . . Sir John Soane in his later day struck out a style of his own, not perhaps to be taken as model-worthy, but certainly to be studied as containing much that is extremely beautiful, and evincing a more playful fancy—if not a more vigorous genius—than has been exhibited for centuries. Never was professor more beholden to the million while he lived. Sir John Soane was certainly subject to the censure of the Press, and was occasionally attacked with much more cruelty than criticism. . . . He had a peculiar feeling for linear decoration." This last sentence refers to the development of the Grecian fret pattern which forms so distinctive a feature in all Soane's compositions.

Many of his details were the outcome of a developed form of the dome with pendentives, often flattened where cramped for height, and thus adapted for domestic dwellings, which may be best seen in his museum, the rooms of which have ceilings in several varied treatments, most ingeniously centred and constructed.

His pediments were very flat and attenuated, his brackets were of cantilever form, his consols of shallow projection, and his chimney pieces like his joinery devoid of mouldings, being usually treated with bands of beads stopped at the angles with a square block, returned at the side, the bands being about 1½ inch wide.



WAITING-ROOM COURT, BANK OF ENGLAND.

One always comes back to Soane's work with freshness; it has a quality which makes one wonder how it is done with such simple means.

The basis of all his designs was, however, Greek. Soane was indeed, as I have already inferred, the forerunner of this phase, and interpreted the style in a much more sympathetic manner than is being practised to-day; indeed, much of the modern Greek work is hard in outline and sorely lacks the natural flowing charm of Soane's work.

Of Soane's influence upon subsequent work I will not say very much. Suffice it, therefore, to say that Sir Robert Smirke, the architect of the British Museum, was in Soane's office for a time; his brother Sydney, however, was never in Soane's office, but appears to have been somewhat influenced too. He erected the Royal Academy, Carlton and Conservative Clubs, &c., while George Basevi, who was articled to Sir John Soane, was associated with Sydney Smirke in the last two works mentioned. His most notable work is the Fitzwilliam Museum, Cambridge, of which the interior was completed by C. R. Cockerell, who also completed Elmes's building at Liverpool. Basevi's short and brilliant career was c
short at Ely Cathedral, where he fell through the Bell Tow

Gandy, Richardson, Parke, and Wightwick are not
chiefly for their fine drawings and some literary work
architecture for which they were severally responsible.

Basevi, Bedford, Edwards and Henry Hake Seward bu
many churches around London and the country showi
Soanean influence. There were many other pupils a
assistants, of whom John Maddox was one in 1760; he w
a beautiful colourist, and had a drawing school at whi
Decimus Burton attended. George Bailey was one of t
later assistants to Soane and the first curator of his museu
which was settled by Act of Parliament on April 20, 18
for the benefit of the public; other curators were Mr. Wi
the late Mr. George Birch, and of course Mr. Walter Spi
is the present curator. Owing to this Act of Parliament
is not possible to exhibit the beautiful drawings and mod
outside the museum, as an application has to be made
Parliament for the purpose, and that is a very expensi
process.

Barry, by the way, either rebuilt or refaced much
Soane's work at a later date, although the two men were
a different school—among which may be mentioned the Boa
of Trade Offices at Whitehall; the College of Surgeo
Lincoln's Inn; Alleyn's College, Dulwich, and the Hou
of Parliament. Barry attempted a Greek design in the p
posed addition to King's College, Cambridge, while his Ma
chester work exhibits as much reserve as Soane's work at t
Bank.

MANCHESTER SOCIETY OF ARCHITECT

ON Wednesday, October 11, the first of the meetings of
Society's winter programme was held, when Mr. Ed
Wood, F.R.I.B.A., delivered the presidential address.

In the room was exhibited a large collection of drawi
and photographs of important architectural works of b
past and present, which were obtained for the occasion
the President.

Mr. Wood said that he proposed to depart from the us
custom which had been followed on many previous occasio
of reviewing the year's work and architectural achieveme
He could foresee that a series of lamentations might be
result, and that was not the spirit in which a new sessio
work should be undertaken. A paragraph of James Rus
Lowell suggested a subject for discussion and thou
"There is only one thing better than tradition, and tha
the original and eternal life out of which all tradition ta
its rise." We all acknowledge, continued Mr. Wood, t
tradition is the greatest factor and the greatest book t
goes to our making. The difficulty is in its interpretati
The temperament of vigour will seek to express itself u
lines founded upon his own conception of the spirit of
work of his predecessors, strengthened by an intense cra
to *create for himself*. How much originality and of relia
on the past is compatible with freedom of thought?

On tradition alone we cannot advance. If we make
past a crutch and ourselves a cripple we are exponent
intellectual stagnation. Do we show our appreciation
the Greeks more wisely in attempting the mechanical re
duction of their forms, or by endeavouring to compreh
the spirit of full-grown manhood in which they wrou
to kindle ourselves by the emulation of it, and to brin
to bear with all its plastic force on our wholly new
dition of life and thought? External imitation of a by
excellence, or even by applying the rules which anal
criticism has formulated from the study of it, produces
artificial, not the artistic. That most subtle of all esse
which eludes chemist, anatomist, and microscopist, the
is in æsthetics not less shy of the critic. The Italian Re
sance fell short in its architecture because to a living
of social and scientific new birth was bound the corpse
past art. The great and magnificent development of
was not accompanied by corresponding achievement in de
The architects were hard at work as students of antiq
while the sculptors were yearning to create.

Yet the notion of absolute originality was an absur
A man cannot escape in thought, any more than in lang
from the past. Not less preposterous than raising
styles is the invention of new ones.

Art must be at once retrospective and progressive
very progress a reflection returned from the mirror of the
Its artists must be endowed with that energy of life w
vitalises and becomes a channel of creative power. T
extent which they possess this force are they orig
creative, fecund. Not in skill, device, artifice or mecha

s originative impulse to be found, but in life—" They are orrents of will." They work in ways dissimilar, but the uality they possess is their measureless vitality, which the cademic is unable to stifle or the archæologist to smother.

From abstract thoughts and reasonings our minds can ravel to the things of to-day and inquire how they influence ur endeavours. In our planning we exercise every mental nergy in satisfying practical requirements. We visit the ost recent developments in every utilitarian direction, and his vitality has justly yielded its reward. Has there been qual success in the development of the architectural contriution, or has our energy exhausted itself *before* we are rchitects? Our clients, it may be said, do not encourage hese things, but is that sufficient to stifle aspiration? Are ot our convictions so true that we are ready to put them side before the indifference of others?

We must, again, remember that the test of an artist ill always be that he has something to say—that he is moved some faith that he holds. He may be a scholar, or ineresting, logical, industrious, but unless he is sincere he can ly be a partial success.

Mr. Wood referred to the collection of works in the room. everence forbade any allusion to those whose works were of e long past, but of the others he could touch upon some as orthy of grateful tribute, and he concluded by an analysis Westminster Cathedral, some works of Professor Pite, Ir. Henry Wilson, and others whose work was exhibited.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

A PLEASANT time was spent by the members of the Sheffield Society of Architects and Surveyors at the heffield University, on the occasion of the opening meeting the winter session. They were entertained to tea by the resident (Mr. J. B. Mitchell Withers, F.R.I.B.A.), who bsequently delivered an address.

He referred to the approaching twenty-fifth anniversary the Society, and said during the period that had elapsed nce the Society was founded nothing was more marked than e recognition by both branches of the profession with which ey were in touch, of the power of combination and organisaon for good, and the education of those who were to follow em as architects and surveyors.

Touching upon the question of town-planning, he said was chiefly an economic question, and while for health's ke open spaces and airy dwellings were needful, they must ot forget that the house was the shelter of the family, the me of those individuals, and must always be the chief conderation in a well-planned city or town. Wide streets ith costly pavements were secondary to healthy houses and aygrounds as open spaces.

So far as the city of Sheffield, the largest in Yorkshire, as concerned, he expressed the hope that the wisdom and resight of the members of the City Council might be such at the city, with its natural and beautiful surroundings, ight be fated to hold the position in their great county to hich it had so rapidly risen. He expressed sorrow that the rchitectural classes at the University were not taken greater lvantage of.

The work executed by students in the Department of rchitecture at the University was inspected, and the embers were very gratified at the all-round excellence of the ecimens exhibited, the improvement in the measured drawgs, compared with previous years, being especially noticele.

WENTY-SEVENTH ANNUAL REPORT OF THE OUNCIL OF THE SOCIETY OF ARCHITECTS.

OUR Council have pleasure in drawing the attention of the members to the twenty-seventh annual report.

Since last October your Council have met fourteen times, d at their first meeting they appointed the Standing Comttees who subsequently elected their chairmen as follows:—terature (E. J. Partridge, F.S.I.); Examination (Prossor Henry Adams, M.Inst.C.E.); General Purpose (E. J. rtridge, F.S.I.); Finance (B. R. Tucker, M.R.San.Inst., st Hon. Treasurer); Practice (E. C. P. Monson, R.I.B.A.); Registration (G. E. Bond, J.P., President).

These committees have held a total of six meetings, in dition to which a number of sub-committees have been apinted, and have met and dealt with the matters referred to em.

One hundred and thirty-nine members, four honorary members, and thirty-nine students have been elected, a total of 182, and after allowing for deaths, removals, resignations, and lapses, the total membership numbers 1,076.

The number of new members and students constitutes a record for recent years, but this number would have been considerably exceeded had not your Council closed the list in April last, in accordance with the spirit of the agreement for the fusion of the Society with the Royal Institute, in anticipation of the matter being concluded at an early date. The list has since been re-opened, but members desirous of recommending candidates should bear in mind the fact that it is liable to be closed at any time.

The Society has been honoured by the acceptance of honorary membership on the part of H.R.H. Prince Luis of Spain, the Right Hon. Lord Saye and Sele, the Right Hon. Lord Monkswell, and Sir George Riddell.

Your Council regret the loss which the Society has sustained by the death of the following members and students:—W. Andrew, Parkstone; J. T. Ashton, Altrincham; Wm. Boyer, Peterborough; W. R. Court, Liverpool; H. Crutchley, Wakefield; Geo. Heaton, Wigan; Jowett Kendal, Pudsey; P. Munro, Bristol; W. J. Rowell, Newton Abbot; E. Skinner, F.R.I.B.A., Colombo; W. T. Wire, London; and M. B Collins, Redruth (student).

They have also to record with regret the death of his Honour Judge Emden, a member of the Registration Committee of the Society. The late Judge took a very active part and interest in promoting the first Registration Bill.

Registration.—Last October a sub-committee was appointed by your Council to revise the Bill and report upon any amendments which they might consider desirable on points of detail without affecting the principle involved. This was in view of a course of action which your Council had decided to pursue to get the Bill considered during the recent Parliamentary Session. The Bill, having been practically redrafted by the sub-committee, was approved by your Council, and everything was in readiness for an active propaganda, when some of the members of your Council were approached by representatives of the Royal Institute, and it became apparent, after friendly discussion, that some basis might possibly be found for mutual agreement on the broad question of general principles, and after due consideration your Council suspended further action for the time being.

Representatives of your Council subsequently met representatives of the R.I.B.A. Council at an informal conference at Conduit Street, as a result of which the Councils of both bodies appointed official delegates to meet and further discuss the question.

The first joint conference was held in January, and was followed by other meetings, finally culminating in an agreement on the general principles of a Registration Bill, and proposals for the election of members and students of the Society into the various classes of membership in the Royal Institute on certain conditions.

The principles of the proposed Bill and the conditions and terms of the scheme for the fusion of the two bodies were made known to the members of the Society by circular on April 4, and the resolutions necessary for carrying the scheme into effect so far as regards the Society were passed by the members either unanimously or by very large majorities at a special general meeting held on April 20. A confirmatory meeting was called for May 11, an undertaking having been given previously by the Chairman that the agreement between the two Councils should be executed prior to the latter meeting.

In the meantime, the proposals as affecting the Royal Institute were approved and confirmed by the general body of their members, and all that remained to complete the matter was the signing of the agreement and the confirmation by the Society's members of the resolutions passed by them.

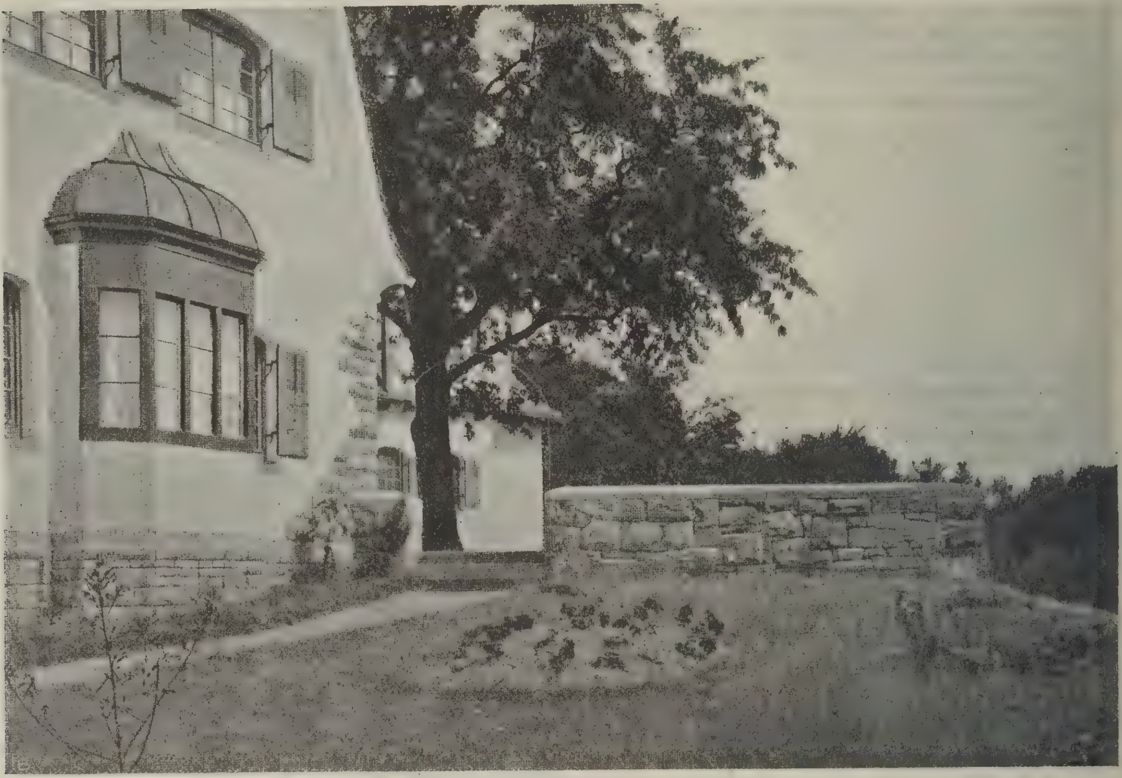
On the eve of the Society's confirmatory meeting intimation was received by your Council that the R.I.B.A. Council were advised that they had not the power under their charter to enter into the agreement, and as the Society could not definitely commit itself without this safeguard your Council decided to suggest to the members the adjournment of the meeting pending the completion and execution of the agreement.

The meeting was consequently adjourned, and in due course your Council received an intimation from the Council of the Royal Institute that they proposed to make an application to the Privy Council for a supplemental charter which would give them the necessary powers to enter into the agreement.

In the meantime, owing to all its activities having been

MODERN EUROPEAN ARCHITECTURE.

GERMANY.



[From *Dekorative Kunst.*

COUNTRY HOUSE AT WITZENHAUSEN.—Herr Richard Riemerschmid, Architect.

temporarily suspended, the Society has been put to the gravest inconvenience, and your Council were recently compelled to consider the position in view of the new session.

After careful deliberation it was decided that the work of the Society should continue without reference to the negotiations proceeding between your Council and the Council of the Royal Institute. Everything, therefore, is proceeding as usual, and will continue to do so unless the negotiations are carried through, in which case all details then arising will be adjusted.

In the meantime, your Council feel sure that the members will not take any steps which will tend to prejudice the Society in any way, or make the position of the Council more difficult in regard to the negotiations still going on.

South African Branch.—The fourth annual general meeting of the branch was held in November last, when Mr. G. S. Burt Andrews was elected President, Mr. M. J. Harris Honorary Treasurer, and Mr. E. H. Waugh re-elected Honorary Secretary.

The total membership of the branch is forty-eight; the statement of accounts shows an increased credit balance, and there is every indication that the branch is making excellent progress and doing good work. Examinations were held in Johannesburg and Maritzburg.

The following addition to the rules of the branch has been confirmed by your Council:—"The retiring President shall be ex-officio a member of the committee for the year succeeding the date of his retirement from the Presidentship."

Last December a conference of South African architects was held at Cape Town, to consider a Bill which had been drafted for presentation to the Government of the Union of South Africa for the registration of architects. The Society's branch was represented by Mr. E. H. Waugh, local hon. secretary, and a resolution was passed in favour of proceeding with the Bill, and the Cape Institute of Architects was appointed the medium of communication between the profession and the Union Government.

The branch has also lent its support to a proposal for a Chair of Architecture in connection with the South African School of Mines and Technology at Johannesburg, and several of its members are actively engaged in organising classes in various subjects.

A number of members are holding office on the Councils of the Association of Transvaal Architects, the Transvaal Institute of Architects, and the Natal Institute of Architects.

Representation at Congresses.—Your Council appointe
official delegates to represent the Society at the followin
Congresses and Conferences:—

National Advisory Town Planning Conference, Liverpoo
February 23 to 24. Mr. Walter W. Thomas, J.P. (pa
President), Liverpool; Mr. A. J. Murgatroyd (Vice-preside
and Local Hon. Secretary), Manchester; Mr. E. C. P. Mo
son, F.R.I.B.A. (Member of Council), London.

The Society is also represented on the National Adviso
Town Planning Committee by Messrs. Percy B. Tubb
F.R.I.B.A. (Vice-President), and Colonel F. S. Leslie, R.
(Hon. Secretary).

Royal Sanitary Institute Congress, Belfast, July 24 to 2
Mr. Anthony Scott (past Member of Council and Local Ho
Secretary), Dublin; Mr. G. F. Ferguson, J.P. (Member
Belfast.

Ninth International Congress of Architects, Rome, Oct
ber 2 to 5. Messrs. Percy B. Tubbs, F.R.I.B.A. (Vice-Pres
dent) and R. G. Lovell (Member of Council).

Mansion House Conference, *re* Crystal Palace, October 2
Mr. Geo. E. Bond, J.P. (President), and Mr. Percy
Tubbs, F.R.I.B.A. (Vice-President).

Architects' Benevolent Society.—Your Council, who a
represented on the Council of the Architects' Benevole
Society, have been called upon in several instances for the
support on behalf of previous members or their relatives
distressed circumstances.

In several cases it has been possible for the Benevole
Society to grant relief, but the work and utility of th
Society is greatly hampered by lack of funds, and yo
Council commend the fund to the generous consideration
the members.

Local Honorary Secretaries.—Your Council appoint
local honorary secretaries for the year in the followi
centres:—Cheshire, Cornwall, Devonshire, Dorsetshire, Du
ham, Gloucestershire, Hampshire, Herefordshire, Hertfor
shire, Kent, Lancashire, Leicestershire, Lincolnshi
Northants, Northumberland, Oxfordshire, Shropshire, Some
set, Staffordshire, Surrey, Sussex, Warwickshire, Yorkshi
Cork, Dublin, Cardiganshire, Carmarthenshire, Denbig
shire, Glamorganshire, Monmouthshire, Argentine Republi
British East Africa, Australia, British Columbia, Canad
China, India, New Zealand, South Africa, Tasmania.

The thanks of the Society are due to these members f
their assistance.

COUNTRY HOUSE AT WITZENHAUSEN.—Herr Richard Riemerschmid, Architect.

The Coronation.—Your Council submitted an address ot alty and congratulation to their Most Gracious Majesties ng George V. and Queen Mary on the occasion of their :onation. The text of the address and of His Majesty's :nowledgment was published in the Journal.

A number of books have also been purchased, and a inite sum has been earmarked for annual additions.

(*To be concluded.*)

CTURES ON HEATING AND VENTILATION, UNIVERSITY COLLEGE, LONDON,

HE first of the series of six public lectures on "The Real Nature of the Problems awaiting Solution by the gineer" was delivered by Mr. Arthur H. Barker, B.A., Sc., Wh.Sc., on Tuesday evening, October 17, at iversity College, Gower Street, W.C.

Sir Aston Webb, in introducing the lecturer, referred to importance of this subject, and said that the present ures, which were the result of the enterprise of the ıdon County Council, would provide teaching both for lents and men in practice. They would prove of great erest and value to architects, who were often supposed to trouble much about heating and ventilation when igning buildings. He could assure those present that reat deal of attention was bestowed upon both by our hitects.

Mr. Barker, in commencing his subject, referred to the nerous difficulties which beset the path of the heating ventilating engineer, some of which would probably er be solved. Problems such as confronted the gas ply companies when they had to consider to what extent ır gas escaped between their works and the customer's er showed what skill and care were necessary in effecly considering analogous difficulties. No accurate solu was practically possible as to the extent to which the l air of a crowded room leaked through the walls and f of the building itself. The function of the heating and tilating engineer resolved itself into the application and isation of heat and air: the former ranging between deg. Fahr. and boiling point for special purposes and ustries, and the latter at atmospheric pressures.

A great difficulty was that many people were their own ting and ventilating engineers. A man heats his premises by coal fires or connected gas fires to the pipes which the gas company made ready for him. He ventilated his rooms by opening the windows, whilst his domestic staff dried his clothes in the open air or at the kitchen fire. It remained for the skilled engineer to justify his existence, and it was to this end that these lectures had been inaugurated.

Rules of thumb with incorrect and inadequate methods had contributed to many failures, and thus the profession had become discredited, and the idea was prevalent that there was no real science of heating and ventilation.

The chief problem to solve was to provide healthy conditions in our buildings in the easiest and cheapest way. Healthy conditions, however, did not always mean comfort; for a building could be quite comfortable and yet unhealthy, or healthy but uncomfortable. It was, of course, largely a question of adaptability, and a great deal depended upon what different persons had been used to. For example, some people could resist hunger to a greater degree than others because they were accustomed to taking their food at irregular intervals. They were used to adverse conditions, although of a not very pronounced type.

Engineers frequently trusted to general experience in considering such problems, but this practice was sure to lead to mistakes. When, however, it was realised how difficult were the nature of experiments as to the composition of atmospheric features to be combated and how divergent were the views of various authorities as to the amount of air per head that should be allowed in buildings, it would be seen how difficult it was to deal with practical problems. Many people said that ideal ventilation consisted of supplying air as provided by nature, but it must be remembered that we were not living natural lives. What had to be aimed at was the maintenance under all conditions of our lives of the normal bodily temperature.

Many of the theories held to be true in the past with regard to essential composition of good air had, in the light of later investigation, been exploded. For instance, the arbitrary proportion of CO_2, fixed, at one time, at not more than 10 parts in 10,000, was now known to be unnecessary, whilst the importance of the presence of ozone in the atmosphere had been unduly emphasised. The assertion that seaside air contained more ozone than any other was, in his opinion, due to the smell of decayed seaweed, which odour was popularly attributed to this constituent.

This all contributed to a change in practice, and it was now thought that more attention must be paid to the humidity of the air which we were to breathe. Dry air, whose humidity is 50 per cent., takes up moisture and causes cracks in floors and fissures in beams, whilst it absorbs moisture from the throat and lungs, thereby causing discomfort. The humidity of natural air in this country varied at Kew from 57 per cent. in summer to 90 per cent. in the autumn, whilst at Aberdeen the variation was from 71 per cent. to 85 per cent. only.

Another cause of much discomfort and disease was the presence of dust in our air, produced by air currents which carried it in from outside, by wearing away of furniture and clothing, and even the detachment of scales from the skin. One had only to look at a ray of sunlight to see that the air was full of these particles of dust, which, when breathed, remained in the body. How to efficiently extract this matter from our buildings constituted another urgent problem.

We had, then, to discover what really constituted bad, and what good, air, and what quantity should be supplied; whether it should be warmed, how to prevent draughts, and finally to consider the question of cost. We were also to face the danger of setting up conditions calculated to produce fresh bodily disorders, and were to aim at such conditions as would prevent them.

Professor Simpson, at the conclusion of the lecture, thanked Sir Aston Webb for his presence at the first lecture on this important subject, and his remarks were seconded by Sir J. Creighton Brown.

Sir Aston Webb briefly replied, saying that he was there as a student as well, and only regretted that he would be unable to attend the complete course.

THE ROYAL SANITARY INSTITUTE.

THE South African branch of the Royal Sanitary Institute are arranging to hold a Congress in Cape Town on November 9, 10, and 11. This is the first Sanitary Congress to be held in British South Africa, and it is hoped that a large number of delegates will be sent by the municipalities and other authorities interested in sanitation. Among the subjects set down for discussion are the disposal of sewage, the prevention of tuberculosis, the inspection of food, milk supplies, and school hygiene; papers will also be read dealing with other aspects of public health work.

The South African branch, which has only recently been established by the Royal Sanitary Institute, seems to be energetically carrying on the traditions of the parent institution, and no doubt its work will have a beneficial effect in the development of public health administration in the Union of South Africa. The honorary secretary to the branch is Dr. A. Jasper Anderson, the medical officer of Cape Town.

THE SURVEYORS' INSTITUTION.

MR. W. EDGAR HORNE, M.P., President of the Surveyors' Institution, will give his opening address in the enlarged lecture hall at the Institution, 12 Great George Street, Westminster, S.W., at 8 P.M. on Monday, November 13. The portrait of Lord Alverstone, for twenty-five years Associate of the Council, will be unveiled on that occasion, and the gold medal for the best paper read during the previous session will be presented to Mr. E. H. Blake for his paper entitled "Some Notes on Highway Law as affecting Property-owners."

Other evenings during the early part of the session will be occupied by the resumed discussion upon Mr. Done's paper of last session on "The Development of Building Land," and papers on "The Burden of Upkeep on Rural Estates, and its Relief under Section 69 of the Finance (1909-1910) Act, 1910," by Mr. W. A. Haviland, "Recent Modifications in the Provisions for taking Land compulsorily under the Lands Clauses Consolidation Acts," by Mr. F. Hunt, "An Evening in the Institution Library," by Mr. Julian C. Rogers, &c.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) contains a number of illustrations of country houses by Mr. Wilson Eyre, Messrs. Averill & Adams, and Messrs. Bonhard & Parsons; designs for small railway stations by Messrs. Price & McLanahan; and three houses on narrow city lots by Messrs. Adams & Warren. There also appear illustrated articles on the oratory of S. Bernardino at Perugia, and on Mont Michel.

La Construction Moderne (Paris) illustrates a house a office for a notary at Noisy-le-Sec, of which Mons. Barr is the architect, and contains also an illustrated article the Hungarian pavilion at the Turin Exhibition.

Deutsche Bauzeitung (Berlin) continues its illustrati of the new Stadthaus at Berlin, and of the town theatre Freiburg, in Breisgau. The new prison at Mannheim is illustrated and described.

The *Western Architect* (Minneapolis) illustrates a num of commercial buildings by Messrs. Liebbe, Nourse & mussen, as well as some churches, a library, and some priv houses in the State of Iowa. Los Angeles Trust and Savi Bank, by Messrs. Parkinson & Bergstrom; an apartm house at St. Louis, by Mr. Edw. F. Nott; and the library of California University, by Mr. John Galen Howa are also illustrated.

Engineering Record (New York) contains an accoun the successful waterproofing of a basement floor to the fact building of the Velie Motor Vehicle Company in Moline, which was troubled with springs that blew up the origi floor.

COMPETITION NEWS.

EVESHAM.—At a meeting of the Rural Council on Mon it was stated that seventy-six applications had been recei for particulars of the competition for designs for thirty tages proposed to be erected at Broadway. Fourteen set designs were sent in. After consideration it was deci that the majority of the schemes were too costly. The f selection will be made at a later date.

MANCHESTER.—The Manchester City Council Royal firmary Old Site Special Committee met on Tuesday to sider the position as raised by the decision of the Cou at the meeting held last week and the deposit with them designs for a new Art Gallery and Free Library. Accor to the *Manchester Guardian* they adopted the report of assessor, Mr. Reginald Blomfield, A.R.A., on the selected plans, out of which he chose one as the best. Of plan Mr. Blomfield reported that "the architectural cha ter of the design generally is that of severe Classic, suc was practised in Manchester and Liverpool in the ea part of the last century, and is, in my opinion, emine suitable for the purpose. Its details have been well sidered from a practical point of view, and the result is my opinion, a fine, straightforward architectural m ment, well adapted to the site, and worthy of its positio a central feature of Manchester." The Special Comm add that in consequence of the adoption by the Counci the resolution moved by Mr. Taylor they are unable to a recommendation as regards the carrying-out of the sch But inasmuch as such resolution excepts obligations w have been entered into, it is necessary to determine the cessful architect in the competition which has taken in order that his rights and the obligations of the Corp tion may be determined. The Council are therefore in for this purpose, and for no other, to approve the re mendation of the assessor and the committee.

NEWCASTLE-UPON-TYNE.—The local Education Comm recently invited competitive plans from architects practi in Newcastle for a senior mixed school and a junior m school, each to accommodate 365 children, at Walker Mr. John Bilson, F.R.I.B.A., the assessor, has placed plans of Messrs. Marshall & Tweedy first, and thos Messrs. Harrison & Ash (Newcastle) second. The latter accepted architects for the Bath Lane schools.

MR. J. HUTCHINGS, architect to the Staffordshire Ed tion Committee, and Mr. S. B. Ashworth, architect t Stoke Education Committee, have jointly prepared plan the proposed technical college in Stoke-on-Trent. Accor to the plans which have been approved by the educa committee the college—a two-storeyed building—will be set back from the roadway. The front will be faced red brick, with stone dressings. The stonework entr facing Victoria Road is made an especial feature. wing will be devoted to pottery and the other to mi subjects. The upper floor will contain two lecture-ro museum, assembly hall, and chemical laboratory. Prov is made for the building of a large assembly hall over cloakroom at a future date. The cost is estimated at tween £17,000 and £18,000.

FORTHCOMING EVENTS.

Saturday, October 28.

Institution of Municipal Engineers: South-Eastern District meeting at Brentwood to inspect Sewage Disposal Works. Train leaves Liverpool Street 1.55 P.M.

Monday, October 30.

Architectural Association: Paper on "The A.A. Excursion to the Loire," by Mr. H. H. Hill, B.A., at 7.30 P.M.

Tuesday, October 31.

Whitechapel Art Gallery: Opening of Old London Exhibition.

The Polytechnic, Regent Street, W.: First of a special course of twelve lectures on Illuminating Engineering, by specialists, at 7.30 P.M.

Wednesday, November 1.

Royal Archæological Institute: Paper on "The Registers of John Gynwell, Bishop of Lincoln, for the year 1349," by Mr. A. Hamilton Thompson, M.A., F.S.A., at 4.30 P.M.

Thursday, November 2.

Architectural Association (Camera, Sketch and Debate Club): Paper on "Woman as a Domestic Architect," by Mr. Edwin Gunn, A.R.I.B.A., at 7.30 P.M.

Saturday, November 4.

Aberdeen Architectural Association: Intermediate Meeting; "A Holiday in Central France," by Messrs. A. E. Payne, A.R.C.A., and Robert W. Gibbon, at 7.30 P.M.

THE CASTLE OF YORK.

HE history of an ancient fortress is an epitome of the history of the country; at least of its military istory, and closely connected with this latter of the neral state of society. Amongst the ancient castles of igland there are few that have surpassed in importance at of the Castle of York. Hence the history* of this onghold which has been very thoroughly compiled by . T. P. Cooper gives us a vivid picture of life in gland in successive centuries.

Our author sweeps away all theories and statements t a castle existed at York before the time of William I., hich seem to have been based upon the authority of illiam of Malmesbury, who wrote in the twelfth century d mistakenly adopted from an earlier writer a description the walled enclosure of the Danish suburb or burh, own as the Earlsburh, outside the walls of York. There says Mr. Cooper, no mention of a castle at York any records of Anglo-Saxon date that have been preved to us, and no evidence that York Castle existed or to the Conquest.

William the Conqueror, in 1068, built his first castle York, the Castle of the Old Baile, on the south-west nk of the river Ouse, and after a revolt of his Danish jects he erected a second and more important castle the tongue of land at the confluence of the Ouse and ss. With regard to these castles our author combats usually prevalent erroneous idea that castles were ays built of stone, pointing out that the castles concted by the Normans in Britain, with very few eptions, were of earth and timber. When William ved at York he found several houses on the plot of d he selected for his second castle. These were olished, and a hillock of earth thrown up on which erected a tower of wood. This formed the keep, and outer bailey was surrounded with an entrenchment of h and bank surmounted by a stockade. At York a her defence was obtained by damming the Foss, and ausing the formation of the King's pool by the flooding he low lying land on the east side of the castle. At wer level was a second pool to provide water for the king of the mill. The first record of the use of stone ork Castle is in the reign of King John, when £37 spent for stone and lime. This was possibly for the tion of the Castle gateway, which, as the weakest point he defence, was frequently the first part of a castle in which masonry superseded the older timber construction, and at York it is known that the ramparts of the Castle were for many subsequent years defended by stockades.

The Castle which William the Conqueror constructed was sacked and dismantled by the Danes under Swegn in 1069, but the timber defences were restored by William, and the wooden keep remained more or less intact until it was burnt down in the massacre of the Jews at the Castle in 1190. When the present stone keep was underpinned in 1903 excavations were made in the mound, and at a depth of thirteen feet, beneath a quantity of charred wood, were found remains of a wooden structure. The timber keep was substituted for one of stone by King Henry III. in 1245-59, but was never enclosed within the walled area of the mediæval castle. The wooden stockades on the earthen ramparts surrounding the castle bailey gave place to walls of stone during the reigns of Edward I. and his successor.

The stone keep erected by Henry III. is one of the most noteworthy examples of mediæval military architecture in England and the only tower existing of quatrefoil plan. Details of the cost of its erection are preserved in the unpublished Pipe Rolls of Henry III. at the Record Office, from which it appears to have cost just upon £2,000, equivalent to £40,000 to-day. Though commonly known as Clifford's Tower, there does not appear to have been any connection between the Clifford family and the Castle until Sir Roger Clifford was hanged upon it in 1322. In the early documents it is invariably described as the "King's Tower," or "the great Tower near to," or "by the Castle of York." The earliest authentic mention of the keep as Clifford's Tower, Mr. Cooper believes to be found in the reign of Queen Elizabeth, when one Robert Redhead, the then gaoler of York Castle, clandestinely demolished and appropriated some of the stonework of the Tower to his own use.

The many strange vicissitudes through which Clifford's Tower passed from the time when it was the chief feature of a strongly fortified castle are detailed in Mr. Cooper's book until it and the walls and towers of the enclosed outer bailey became neglected and ruinous, although the Castle was still in sufficiently good condition during the Parliamentary war to afford a *point d'appui* first for the Royalists and then for the Parliamentarians. Subsequently the history of the Castle of York is mainly that of the county prison, and the conditions under which prisoners lived in the eighteenth century in what was then considered one of the best in Europe are described by our author from the accounts of John Howard, F.R.S.

The History of the Castle of York from its Foundation to the ent Day, with an account of the building of Clifford's Tower. . P. Cooper, author of "York: the Story of its Walls, Bars and es." (London: Elliot Stock. 12*s.* 6*d.* net.)

ARNO'S GROVE, SOUTHGATE.

In 1825 the prison at York was considerably enlarged, and at that time Clifford's Tower was bought from a private owner, Samuel Wilkes Waud, Esq., together with his house and garden in Castlegate for the enlargement of the prison area. The ownership of the Tower after the restoration of King Charles II. seems to have been for some time rather curious, for in 1660 Sir Henry Cholmeley Knight petitioned the King that "having purchased Clifford's Tower in York from one Mr. Moore (whose ancestor had it granted from the Crown in the twelfth year of King James, your Majesty's grandfather) with intention to pull down the same. But your Majesty having made Major Scott governor thereof and continuing it a garrison, your petitioner cannot make his benefit thereof." The Tower seems to have been, however, used as a military post from 1643 to 1684, when its interior was gutted by a conflagration that there is considerable reason to believe was caused by an incendiary. The lawful owners of the Tower were then permitted to enter into actual possession, and the property was sold in 1699 to the owner of the dwelling house and grounds abutting on Tower Hill ditch, from whom it passed through several successive owners to the Mr. S. W. Waud from whom it was purchased by the county for the enlargement of the prison.

NOTES AND COMMENTS.

Opposition to the general principle of town planning with a small number of houses to the acre has been a feature of several proposals for new schemes in and around Greater Birmingham, and we are glad, therefore, to learn that in his latest lecture at Birmingham University Mr. Raymond Unwin has clearly demonstrated that the reduction of the number of houses to the acre does not mean less profit to the landowner, but may mean considerably more.

Taking for the purpose of illustration an esta
20 acres, Mr. Unwin worked out and compare
development figures on the basis of 248 houses a
500 houses. Assuming the price of the land at £
in each case, he showed that whilst the smaller num
houses would require an expenditure on roads of £
the larger number would entail a cost of £14,991.
the owner of the estate would have to find £6,000
capital for development of the closely-packed area
for the more open arrangement, the total cost of lan
roads in the one case being £20,991 and in the
£15,008.

Having laid out an additional £6,000 on his
the landowner would have to offer 500 plots of an a
area of 127 square yards each instead of 248 plots
average area of 310 square yards, and to cover his ex
ture, omitting profit, must charge the purchaser
small plot 6*s.* 7¼*d.* per square yard instead of 3*s.*
per yard for the larger plot. It is unnecessary to a
more than an average amount of intelligence in th
chaser to draw a conclusion as to which is likely to
more favourable position for the landowner, assum
course, that there is a market for the plot of 310
yards. Those who oppose the limitation of 12
to the acre usually base their objections on the in
of certain classes of tenants to pay the necessary
rent for the ground value of the larger plot, which
Unwin's typical scheme he placed at 11¼*d.* as
7¾*d.* for the smaller plot; but the maisonette type o
with two floors and one residence on each seems t
be a better solution than that of each little house
own tiny plot. It is surely better that two families
share 310 square yards than that each should h
exclusive use of 127 yards.

BROOMFIELD PARK, SOUTHGATE.

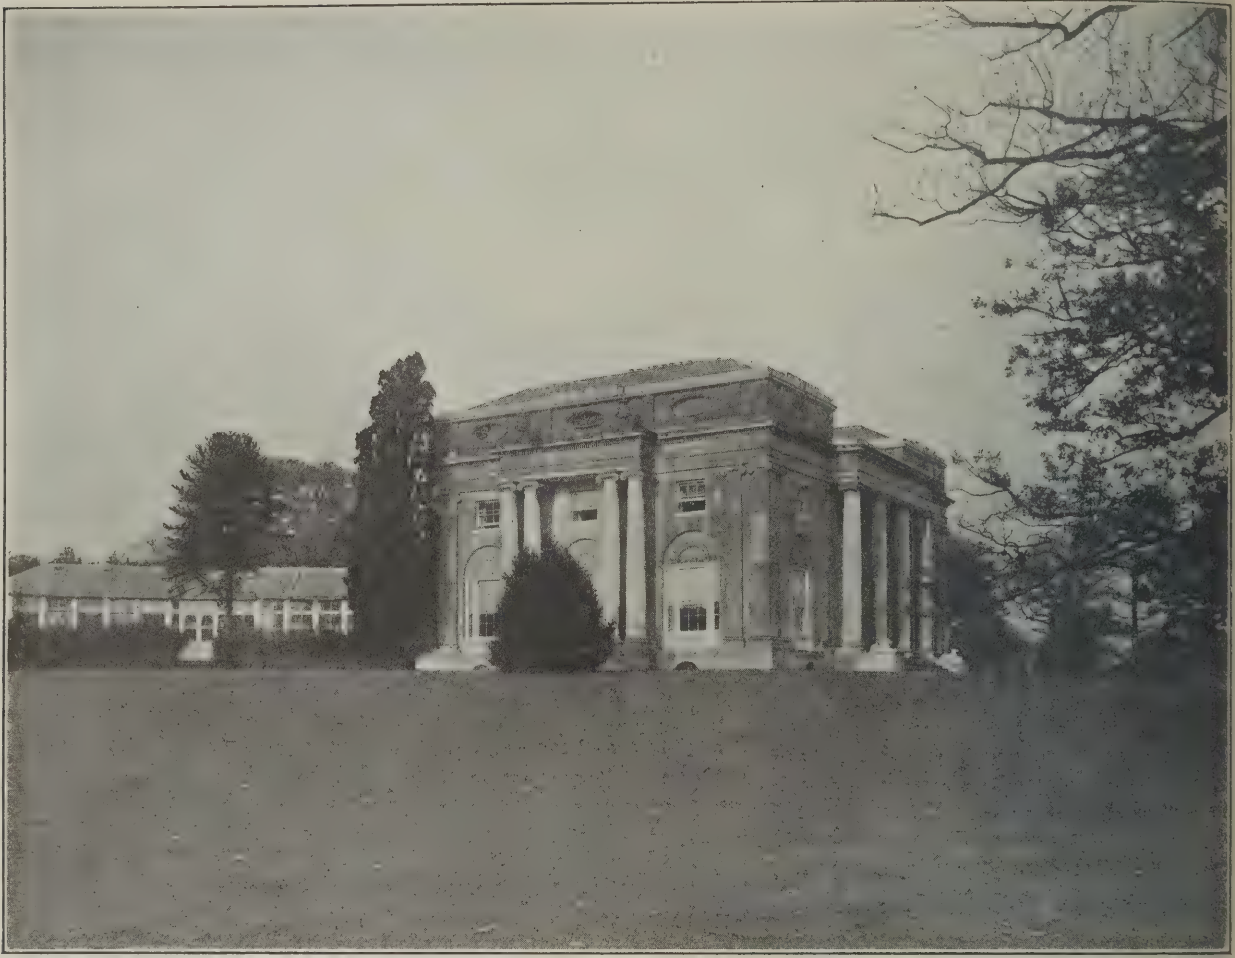
Therefore, from the point of view of a landowner hold- ıg only a small estate of 20 acres, we think Mr. Unwin as made out his case for limitation of 12 houses to the ross acre being more profitable than the full quantum of 5. But with regard to large landowners Mr. Unwin ghtly points out that the increased area of plots means larger extent of land brought from an agricultural value , say, £50 an acre to a building value of £300 an acre.

Mr. Unwin's teaching may, perhaps, be advantageous) the scheme which the Town Council of Sutton Cold- eld desire permission to prepare, affecting a prescribed rea of the borough comprising about 5,000 acres. At ıe meeting called to consider the proposals of the Town ouncil under the Housing and Town Planning Act it was nanimously resolved that the Council do not apply for ermission to prepare a scheme until the landowners had een further consulted. Now the landowners had better udy Mr. Unwin's figures.

The Newcastle City Council has adopted the proposi- on of Mr. Johnston, to which we referred in these notes few weeks back, and will "advertise and offer for open ompetition three prizes of £50, £30, and £20 respectively, r plans for the laying out of 200 acres of the Walker state upon model cottage lines." For the chance of ıese handsome prizes competitors must also design four pes of cottages. We still hope to see the conditions odified when the President of the R.I.B.A. is asked to ominate an assessor.

The meeting held at the Mansion House last Monday ves promise of a successful issue to the projects for the quisition of the Crystal Palace and its grounds for the se of the public. The Lord Mayor's motion that the rystal Palace should be so acquired and that a committee ould be appointed to make arrangements for an appeal for funds and to consider the most practical scheme for the future management and control of the Palace was carried unanimously. Lord Tenterden, on behalf of the Council of the King Edward National Memorial, offered £5,000 towards the deposit of £20,000 required, and for which the Lord Mayor had already received promises of £7,000. There should be no difficulty in completing the necessary amount now that a Mansion House fund has amalgamated the apparently opposing, or at least independent, action of separate bodies of enthusiastic workers for the good cause.

The third report of the Royal Commission on the Ancient and Historical Monuments and Constructions in Scotland, containing an "Inventory of Monuments and Constructions in the County of Caithness," is a volume richly illustrated with drawings, reproductions of photographs, ground-plans, and maps, including a map of the county indicating the position of the various objects of archæological interest. The Commissioners in their report say that the monuments and constructions of Caithness were found to be more numerous and important than was expected, and, though belonging mainly to prehistoric times, they include a number of castles characteristic of the various periods of Scottish castellated architecture from the fourteenth to the seventeenth century. The list of long cairns, the earliest monuments of prehistoric times, was considerably augmented, many of these being identified and examined for the first time, while of later cairns, chambered and otherwise, there were found a number of fresh examples. In the year 1870 seventy-nine brochs were enumerated within the county. The number still in evidence, or of which the sites are recognisable and recorded, has now been increased to 145 as the result of the survey. Many of these, however, are reduced to little more than foundations, and most of them are contained in mounds overgrown with vegetation. Throughout the



GROVELANDS.

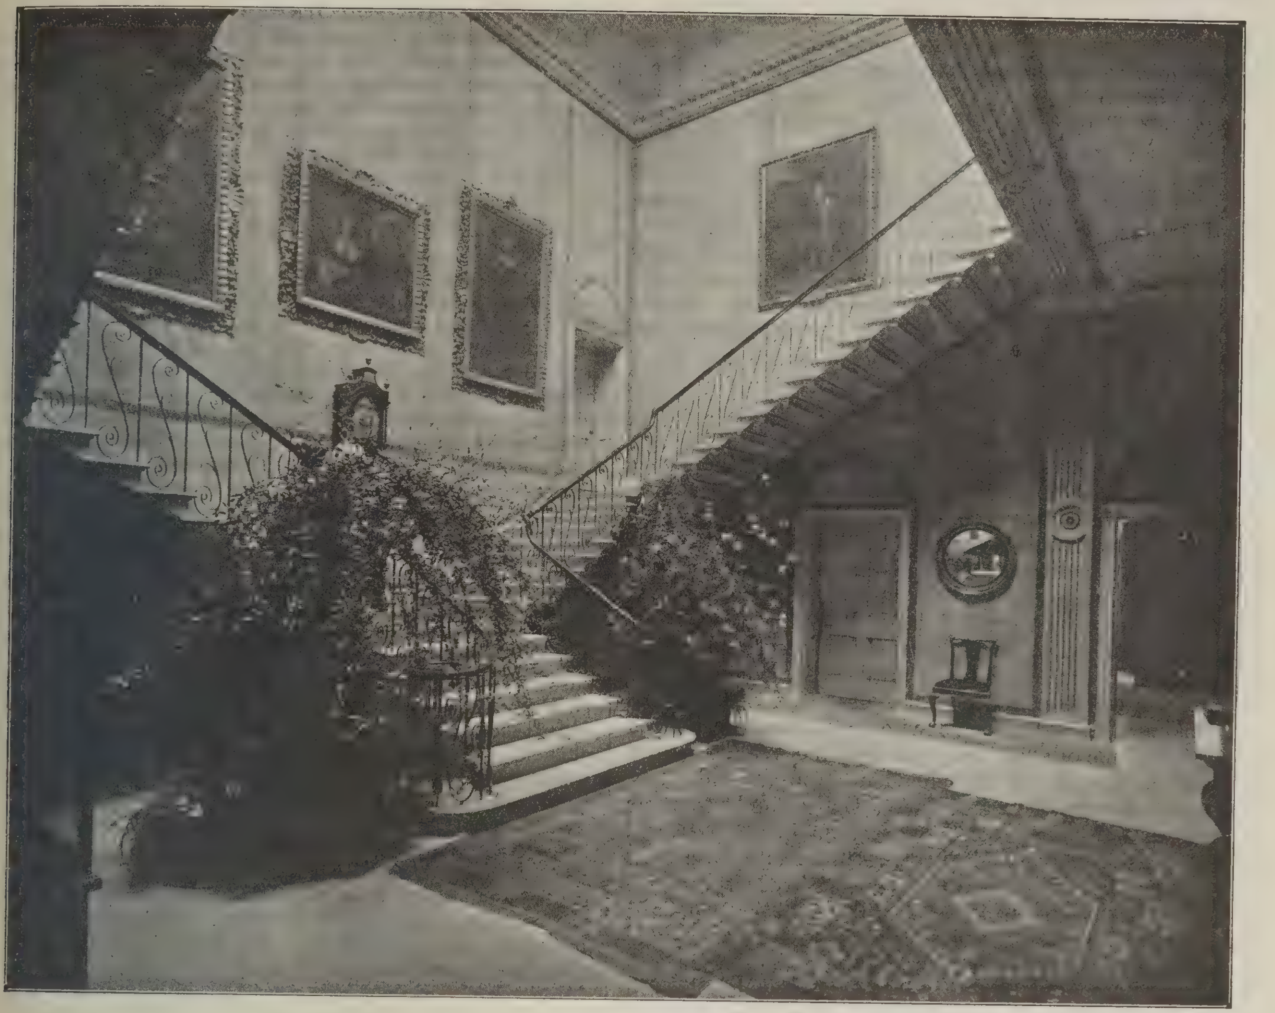
county 24 were found to have been excavated, and details of the excavations and a note of the relics recovered are contained in the inventory.

An interesting discovery that was made in the course of the Commissioners' work was that of a dwelling belonging to the Iron Age, circular or oblong in shape and megalithic in character, discovered in the parish of Latheron, the remarkable feature of which is a gallery or corridor around the interior. A survey of the monuments and constructions in Galway is now being undertaken, and work is also being organised for the survey of ancient buildings in the towns, commencing with Edinburgh. In connection with the proposed memorial at Holyrood to the late King Edward, the Commissioners have expressed their sense of the great importance of preserving existing examples of old Edinburgh architecture included in the scope of the scheme.

SOME SOUTHGATE SEATS.

In the minds of the majority of people Southgate is linked indissolubly with the Lunatic Asylum for the County of London, yet the district is from all standpoints one of the most charming suburbs on the beautiful northern heights. It is a well-known fact that with the linking up of the suburbs consequent on the ever-spreading growth of the metropolis, the outlying districts are immediately assailed by the noble army of speculative builders, who soon begin the transformation of the neighbourhood, and many a row of residences appears on the site of a once famous estate. Although Southgate has experienced the modern builder, and innumerable finger-boards may still be seen in the vicinity, inviting one to obtain particulars at the agent's office, there is some satisfaction in knowing that one or two of the famous old mansions are still standing which earned for it the distinction of possessing the finest seats in Middlesex.

The chief of these is undoubtedly Broomfield Hous an old Tudor structure, encompassed by a park of fif acres, a striking testimony to the good constructi powers of our ancestors in the art of building. Original the house was a monastery, hard by the at one ti famous forest of Middlesex, and the three large lak directly in front of the mansion were evidently of use the monks in obtaining their indispensable Friday far It is probable that when "Bluff King Hal" dealt hard with the conventual establishments of the country, evidently gave Broomfield House to one of his courtier a supposition which is borne out by the fact of the buil ing being of Tudor design. James I. inhabited t premises as a shooting-box while following his favouri sport, and a century later it became the home of t Skeffingtons and Jacksons, and in our own time was t residence of the late Sir Ralph Littler, K.C. The interi of the fine old place is quite in keeping with its outwa charm, all the walls being panelled in rich dark oak, whi the staircases bear some handsome intricate carving the same material. The walls and ceiling of the stairw —a massive specimen of Jacobean work—are adorn with valuable frescoes representing in emblematic design the Four Seasons, the work of Sir James Thornhi whose art is also represented at Hampton Court, Gree wich Palace, &c. On the ground floor are the drawin room, dining-room, and a billiard-room, the doors which are of solid oak, and of an unusual thickness, whi the mantlepieces are admirably worked in oak. Amo the fifteen smaller rooms on the floor above is a curio little anteroom resembling a secret chamber. The roo dry cellarage is of extensive range, and includes a natu spring, the water from which was made to flow in a tank, where wines and other beverages were placed f cooling. The large hooks which may still be seen und the massive gateway serve to remind us of the glories the chase, in which Broomfield House evidently play



THE STAIRCASE, GROVELANDS.

o the full its part. The park boasts much fine timber, ncluding a double avenue of elms, which tradition marks lown as having formerly been the western approach to he Royal chase of Enfield; while better examples of Scotch fir and green oak would be difficult to find. Broomfield House and grounds were purchased in 1903 y the Southgate Urban District Council for the sum of 25,000, and dedicated to the public as an open park for ver.

Adjoining Broomfield Park are the house and grounds f Arno's Grove, at one time called Arnolds. This estate vas owned by several distinguished families until, in 720, Mr. James Colebrooke leased it for a term of three ears from Oliver Horsemann, executor under the will f Sir Samuel Blewitt, of Edmonton. The property was escribed as "all that capitall messuage or mansion ouse, with the outhouses, orchards, gardens, and urtilages thereunto belonging, with the appurtenancies, 1 South Street, alias Southgate, late in the possession r occupation of the said Sir Samuel Blewitt," &c. mong the fixtures were "a sideboard with an foot," "a atchment and a picture of the Serjeant's yeoman," twelve pictures of the Apostles and two Escutcheons," a Chimney sett with Dutch Tyles," "a draught of ıe house in a picture," and "twelve leather bucketts anging on peggs." Mr. Colebrooke destroyed the old ansion, and commenced the erection of a new one, but ying while the work was in progress, it was completed y his son, Sir George Colebrooke. The estate was after-ards sold to Abraham Hume, Esq., for £10,302 5*s*.

In 1776 the owner was Lord Newhaven, who greatly nproved the premises and added a wing. A few years ter it came by purchase into the hands of Isaac Walker, sq., in whose family it has remained until the present me. The Walkers deserve notice for their devotion to ır national game of cricket, Tom Walker, a member of the old Hambledon Club, having invented, in 1785, the round or straight arm method of bowling, in distinction to the old underhand practice. The mansion possesses some interesting apartments; in the dining and drawing-rooms there are two valuable Sicilian jasper mantlepieces, executed in Italy, one of them consisting of a magnificent statuary mask of Apollo. The picturesque stairway is decorated with the triumphal entry of Julius Cæsar into Rome—one of the finest examples of the work of Lanscroon—while the large and valuable collection of paintings, Etruscan vases, and relics from Herculaneum and Pompeii, must also be mentioned. The grounds originally comprised 100 acres, covered with beautiful timber, including cedars of Lebanon, and tall Weymouth pines, the whole being watered by the New River.

Grovelands possesses the distinction of having been renamed three times within half a century. Originally called "Southgate Grove," the name was changed by J. Donnithorne Taylor—grandfather of the present owner—to "Woodlands," and again in 1850 it was re-christened "Grovelands." The building, which is chiefly Ionic in its design, was erected at the beginning of the last century by Thomas Nash, the architect, and is encompassed by undulating pleasure grounds, which are very pleasing in their effect as they gradually fall to a piece of water. The original gates of this mansion now form the entrance to Broomfield Park, and are inscribed the "Village gates." Since the opening of Broomfield Park in 1903, it has been the intention of the Council to provide a similar recreation ground for the Winchmore Hill portion of the district, but owing to negotiations falling through, this project has had little chance of being carried into effect. Quite recently, however, an agreement has been signed by the Council and Captain Taylor, the owner of the estate, whereby sixty acres have been purchased for the sum of £20,000. When the necessary formalities have been concluded, the work will at once be put into hand. Access to the new park will be gained by six different entrances, of which the chief will be 160 feet in width. This gate will be one of the chief features of the development.

Queen Elizabeth's Hunting Lodge was for a period of half a century or more inhabited by the Rev. Charles Bradley, elder brother of the late Dean of Westminster, who conducted a school there. Tradition records that "Good Queen Bess" was accustomed to watch the hunting from the garden of this lodge; hence its name. Eagle Hall, the birthplace of Leigh Hunt, the littérateur and poet, is still existing, although hidden from view by a row of modern buildings.

With regard to the famous seats of Southgate, which have unfortunately disappeared, precedence must be given to Minchenden House, the residence of the Duke of Chandos, who, after the demolition of his other residence, Canons, at Edgware, came to reside at Southgate. It was erected in 1741—a large brick building shut out from the high road by a high wall—by one John Nicholl. His daughter, who inherited the mansion, married James Duke of Chandos, who had been appointed Ranger of Enfield Chase. The house became the residence of the Dowager Duchess of Chandos until 1713, when at her decease the estate came into the possession of the Duke of Buckingham, through his wife, who was the heiress of the last Duke of Chandos. In 1847 the Walker family became possessed of Minchenden House, and they destroyed the mansion and added the grounds to their adjoining estate of Arno's Grove. To gain the entrance of this fine edifice one had to traverse a broad gravel path running parallel with the New River, and then through a shrubbery which led on to the lawn. A massive pollard oak, known as the Chandos oak, is still in existence, and is said to cover more ground than any other tree in England, its spread measuring 136 feet, which is still increasing. Although Minchenden House is now no more, the name is still perpetuated in the form of a smaller structure called Minchenden Lodge, a little to the north of the original site, at which the late Queen Victoria and Prince Consort stopped when they laid the foundation stone of the Lunatic Asylum for the County of London.

Culland's Grove was situated close to Alderman's Hill, which derived its name from Sir William Curtis, an Alderman of the City of London, and Lord Mayor in 1795. He made Southgate his residence for many years, and on being created a baronet in 1802 was described as of "Culland's Grove, Southgate." Curtis was the most caricatured man of his time, and although a friend of the Court and a mover in the élite of society, it would appear that he was exceedingly ignorant. History records that ". . . when his Royal patron was dining at Culland's Grove, a Mr. Cox being of the party, Sir William proceeded to toast his Majesty and the commoner in one health, and in these words: 'Here's to the three C's—King, Cox, and Curtis.'"

Although the purpose of this article was to give some account of the seats of Southgate, one cannot conclude without a few words on the parish church—one of the finest in England. It was erected in 1860, a handsome stone edifice in the Early English style, from the designs of Sir Gilbert Scott, R.A. The building is lofty with north and south aisles and chancel. Among the stained glass windows are two at the east end of the north aisle by Burne-Jones and another at the west end of the south aisle by Rossetti. There are also various memorial windows which do not need to be enumerated here. The north transept was converted into a Lady chapel in 1906 by Vyell E. Walker, of Arno's Grove, in memory of his parents. The tower contains a peal of fine toned bells, and also a set of Cambridge chimes, which were installed as a souvenir of the late Queen Victoria's Jubilee in 1887. Christ Church, Southgate, is indeed a most handsome parish church, standing as it does amid pleasant surroundings, with its massive spire towering far above the tallest greenery.

ROYAL ARCHÆOLOGICAL INSTITUTE.

By permission of the Dean of Westminster, the Right Rev. Bishop Ryle, the autumn meeting of the Royal Archæological Institute was held on Friday, October 20, at Westminster Abbey. During the two-days' autumn meeting of last year attention was concentrated on the Abbey itself with its monastic buildings. Last Friday was devoted to a consideration of the mediæval monuments.

The members first collected in the Jerusalem Chamber. Sir Henry H. Howorth, K.C.I.E., D.C.L., F.R.S., F.S.A., the president, said the chamber in which they met was an ideal meeting-place for an antiquarian society such as theirs, and most especially because of its memories. The Abbey itself was more wonderful than anything else of its kind in the multiform aspects in which it appealed to Englishmen and to foreigners. It is not only a magnificent monument of architecture of the very best period, but it was the cemetery of England's greatest men. Here there was more sacred dust buried than in any other place in the whole universe. The number of interesting monuments in it was so great that it would be impossible to deal with them all in one meeting. Their work that day would be limited to the monuments of feudal times reaching down to the Tudor period. There would have to be the great gap left of all the later monuments. Those awful fellows, the architects at the beginning of the Gothic period, thought that everything should be swept away with the exception of what was Gothic; but in the Abbey they had a place where the whole history of sculpture right down from the earliest to the latest times could be traced, a great museum of English art and history combined such as was not to be seen anywhere else. In conclusion, Sir Henry Howorth expressed a hope that they would be able to arrange a further meeting in order to cover what had that day to be passed over.

Mr. W. H. St. John Hope, M.A., next by the aid of a large scale plan described the mediæval arrangement and use of the Abbey church down to 1540. The mediæval monuments which they had come to examine had been in the past, he said, greatly neglected—partly because people looked on them as something of a wreck, and partly because they had become overshadowed by later work. Most beautiful pieces of work had been stowed away into corners in order to make way for tasteless piles of marble sculpture. The first point for their consideration was the question of the mediæval arrangement of the Abbey, as this was indispensable if they were to understand what they saw. The Abbey church of Westminster was really an Abbey church, and nobody had any parochial rights there. The latter rights were provided for in the Confessor's time by the adjacent St. Margaret's Church. It was, however, more or less attached to the Palace which, of course, stood on the site of the present Houses of Parliament. The King for the time being was the only parishioner ever recognised by the monks. When the Abbot claimed the body of Henry VI. who had died at Windsor, it was because the King was their sole parishioner.

In consulting the plan of the Abbey one had not to think of outsiders at all, for any outsiders who attended only did so on sufferance. So the middle part of the church was practically the chapel of the monks, perfectly self contained and enclosed by a screen, where they sang the services. At the west end of the choir stood a very substantial screen containing the organ, and against which there seem to have stood two altars, one dedicated to the Holy Trinity and the other called the altar of St. Mary o the North Door. Why that small door in the north aisl wall was so important is difficult to say. The altar of th Holy Cross stood undoubtedly in the nave, and probabl against the barrier which stretched right across the churc at a distance of one bay west from the pulpitum. Agains it also was apparently the altar of St. Helen. All th arrangement of the west end can be satisfactorily accounte for as to its uses and the positions and need for the doors A very magnificent rood was put up by Henry III., an presumably was that alluded to afterwards as the crooke rood. At the end of the choir hung a certain number o bells; they must have been in the lantern. About the middl part of the choir—*i.e.* under the crossing—was a platform called the Lower Pavement, on which stood the choir altar Behind it stood for a very considerable time an enormou seven-branched candlestick of bronze, the result of th Judaising movement of the twelfth century by which man church ornaments were based on those of the Temple. Th exact position of all these things is fixed by the record o two burials near by. The whole area from the pulpitum was shut in from the aisles by screens with doors. From the Lower Pavement one ascended two steps to the Upper Pavement, or sanctuary. Dividing the two was the Lantern Veil of rich material.

The choir was remarkable for the number of superb things in it. The most beautiful mosaic pavement in front of the altar was the work of Abbot Ware. The long inscription in brass letters, pieces of which still remain, record that the materials were brought from Rome in 1268 by Abbot Ware, and put together by Odericus of Rome. The mosaic was here arranged in a background of Purbeck marble instead of the white marble customary in Italy. The east end of the presbytery was closed in by a wall against which stood the high altar, and which was continued westward so as to link up behind the tombs with the wall down each side of the choir. In the first bay on the south side are the wooden sedilia erected in 1308. In the adjoining bay in the sanctuary used to stand the King's pew or closet. It was reached from the Palace through a small door on the south side called the *posterum palatium*, and here the King sat whenever he was minded to come to hear a service. For a very long time the east aisle of the south transept was kept free of monuments so that the King might have direct access from his private door to his pew. At the time of Henry VIII. this pew was removed and the tomb of Anne of Cleeves substituted for it.

Mr. Hope next spoke of the extraordinary artistic merit of the early monuments. There was also an astonishing collection of brasswork, which has been spared by a miracle. More mosaic work was to be seen here than in any church north of the Alps. All of the examples are works of extreme importance. A certain amount of post-Conquest decoration has been generally overlooked. Perhaps the most remarkable piece was the great tabula, which was in all probability made in 1269, at the time of the opening and rededication of the church. There is, besides, still remaining beautiful iron and wood work. The collection of heraldic work was extraordinary, including as it did the earliest examples of monumental heraldry from 1250 to 1500 odd. Then there was the galaxy of sculpture. It did not matter on that occasion to whom these monuments belonged, for they had to be quite cold-blooded historically and only consider them from an artistic standpoint.

The party then passed into the nave, where the heraldry of the carved shields in the spandrels was examined. Some of the spandrels in the north transept are carved with beautiful foliage and others with figure subjects. This carving was first introduced in the thirteenth century. Unfortunately much of it is now mouldering away through the effects of the London atmosphere. It behoves students to examine it before the surfaces get more decayed. Although usually the shields are passed with a cursory glance from visitors, they must have aroused great enthusiasm originally and spread the fame of the Abbey as a sculpture gallery.

The mosaic pavement in the sanctuary was next inspected. This is usually covered with three layers of carpet as being far too precious, as Mr. Hope pointed out, for ordinary people to walk upon. Fortunately, the central part had been exposed. The reredos behind the altar is, of course, modern, being part of the restoration under Sir Gilbert Scott. Its large mosaic of the Last Supper was executed by Salviati. In the famous tombs on the north side "weepers" were introduced. This is the first occasion on which this subsequently almost inevitable feature of a mediæval monument was employed. At the back of the tombs to Aymer de Valence and Edmund Crouchback a heavy iron grate took the place of the wall (still behind the tomb of Aveline), which isolated the choir and presbytery. In Henry VIII.'s reign the royal pew was cleared away entirely. The portrait of Richard II., which is now hung in that bay, was considered by Mr. Hope to be one of the finest royal portraits in the world. It was painted for King Richard in 1394. Difference of opinion exists as to its authorship; Mr. Hope believed it to be English work. The whole groundwork was originally covered with gesso, while the crown and sceptre were modelled. About fifty years ago it was given to an eminent painter (Mr. George Richmond) to clean, and he removed all the gesso surface under the impression it was a modern accretion. Fortunately, a friend came into his studio in time to save one small patch. Probably, suggested Mr. Hope, the figure was painted by one artist and the panel was then handed over to another, and inferior, artist to finish. Its present frame was designed by Sir Gilbert Scott, or rather copied from an illuminated MS.

Writing in 1734, an American amateur in a lengthy account of the Abbey made the following, among many startling observations:—"The enclosure behind the chapel, commonly known by the name of St. Edward's Chapel, has nothing very remarkable in it but certain Gothic antiquities which are made sacred by tradition only, and serve to excite a stupid admiration in the vulgar." How different this from the claim of Mr. St. John Hope that the chapel contained more works of art than any other chapel of its size in the world! Besides the seven wonderful tombs encircling the shrine there is behind the reredos of the high altar the sumptuous stone screen with its series of representations of legends connected with the life of the Confessor. It was probably carved in the time of Edward IV. Below this frieze the screen is divided into panels with elaborate canopies. In the centre stands the oak coronation chair and the sword and shield. The former was made by King Edward I. to contain the stone of Scone. The original order was for a chair of bronze, but after this was completed the king was not satisfied, so another one was made in oak and covered all over with gesso decoration, of which traces still remain. In 1901, said Mr. Hope, the stone of Scone was taken out and examined in the presence of himself and others. It was found to have been cut at the back and front to fit the chair, and hanging rings had been let into the end so that it could be carried on a pole. The four small gilt lions supporting the chair are modern. The long two-handed sword and battered wooden shield of State are accepted as having belonged to Edward III. The shrine of St. Edward is remarkable for being one of the few royal tombs which still contain the original bones. It always had an altar at its west end for use in connection with the coronation service. The pall suspended above the shrine was put up at the instance of the late Mr. Micklethwaite. The whole chapel used to be paved with beautiful mosaic, though of a less elaborate design than that of the adjoining presbytery. A fragment of it may be seen in front of the coronation chair. Henry III.'s mosaic tomb was considered by Mr. Hope to be one of the most beautiful things in the world.

The party next divided into two groups to inspect the six chapels entered from the ambulatory; the first went round with Mr. St. John Hope and the second under Mr. E. S. Prior, F.S.A., and Mr. C. R. Peers, secretary of the Society of Antiquaries. Mr. Prior had drawn up the following broad divisions of the monuments in the sanctuary and chapels:—

The Order of the Mediæval Monuments in a Chronological Scheme is given by Roman Numerals.

	Dates of Making
CLASS A. The first Westminster styles.	
(*a*) Marble monuments with bronze effigies, c. 1270—c. 1300.	
I. Princess Catherine (d. 1257) and young children of Edward I.	c. 1270
II. Henry III. (d. 1272) . . . Mosaic tomb, c. 1280	Effigy c. 1291
III. Queen Eleanor of Castille (d. 1291)	1291—1294
IV. William de Valence (d. 1296).	c. 1297
V. Edward I. (d. 1307)	c. 1305(?
(*b*) Caen-stone monuments with gesso enrichments, c. 1280—c. 1320.	
VI. Aveline, Countess of Lancaster (d. 1273)	c. 1280
VII. Crouchback, Earl of Lancaster (d. 1296)	c. 1295
VIII. Aymer de Valence, Earl of Pembroke (d. 1324)	c. 1320(?)
(*c*) Monument of marble, alabaster and stone, with alabaster effigy.	
IX. Prince John of Eltham (d. 1336)	c. 1340
CLASS B. The second Westminster styles.	
(*a*) Royal monuments in marble, alabaster, and bronze, c. 1365—c. 1400.	
X. Queen Philippa of Hainault (d. 1369)	1367 & 1377
XI. Edward III. (d. 1377)	c. 1378
XII. Richard II. (d. 1399) and Queen Anne of Bohemia (d. 1395)	1396 & 1397
(*b*) Monuments of ecclesiastics and nobles in alabaster, stone, and brass.	
XIII. Cardinal Langham (d. 1376), marble and alabaster	c. 1380
XIV. Sir Bernard Brocas (d. 1395), stone	c. 1395
XV. John de Waltham, Bishop of Salisbury (d. 1395) Robert de Waldeby, Archbishop of York (d. 1398) Lady de Bohun (d. 1399)	"Brasses" in marble 1395—1400
XVII. Philippa, Duchess of York (d. 1431) XVII. Abbot Colchester (d. 1420) XVIII. Abbot (?) XIX. Sir Ludovic Robesart (d. 1431)	Freestone monuments 1420—1435
CLASS C. Chapel Monuments.	
XX. Henry V. (d. 1422)	c. 1425

In speaking of the tomb of Henry VII. Mr. St. John Hope made some interesting observations as to its possible connection with Windsor. Henry VII. conceived a desire to build a Lady chapel at Windsor and to accommodate there the shrine of Henry VI. and his own tomb. The accounts reveal that between 1501-3 large sums were expended on the king's tomb. It would appear as if the present bronze grille was begun for Windsor and then brought to Westminster. The tomb within it was undoubtedly specially made by Torrigiano, though even here it is suspected that a little of the original English work was incorporated.

(To be concluded.)

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Breaking Up of Landed Estates.

Sir,—The breaking up of so many landed estates throughout the country will remove an influence which for centuries has been identified with our great landowners in the preservation of natural scenery. This may be seen on all sides, in town and country. In London it gave us the 400 garden squares of which we may well be proud, and in the country that influence has preserved the landscape in innumerable places.

As this influence wanes, can we look for another conserving force without the intervention of a public authority? This question appears to me to be answered in the affirmative by a landowner who, in submitting to auction lands in Eynsford and Farningham, bars the erection of objectionable buildings by a condition of sale that each building shall be subject to the approval of the Royal Institute of British Architects. All purchasers being under like restrictions, all are alike benefited and the community gains.

Those who know the valley of the Darenth, with Lullingstone Park, the seat of Sir William Hart Dyke, and the Elizabethan mansion of Frank's Hall, recently purchased and restored by Earl Bathurst (whose ancestors occupied in Tudor times) will appreciate this effort to preserve the old-world setting of a valley which owes so much to the celebration of Arbor Day by the annual planting of shade trees in the thoroughfares and fruit trees in the cottage gardens of Eynsford and Farningham.

This proposal to substitute the influence of the Institute of British Architects for that of the great landowners will, I trust, be cordially supported.—I am, &c.,

THE ROYAL HOSPITAL, SHEFFIELD.

This important addition to Sheffield architecture replaces an older institution known for many years as the Sheffield Public Hospital and Dispensary. Their present Majesties, King George V. and Queen Mary (then Duke and Duchess of York), opened the out-patients' department and wards known as the York Block in May 1895, and laid the foundation stone of the Nurses' Home. The administrative block was added in 1898, the central ward block in 1900. The remainder of the work has been in progress during the last two years, and consists of operating theatres, ophthalmic wards, further administrative offices, and a three-storey ward block. The completed hospital will provide accommodation for some 220 beds. Dental and electrical departments are also included. The design has been, as far as possible, based upon the earlier traditions of the Italian Renaissance rather than upon those later phases which are in evidence at the present time. Weldon stone and hard, thin local bricks on a plain grit-stone base have been used externally, and cement concrete construction with steel joist reinforcement was adopted for the earlier portions of the buildings, while in those recently completed reinforced concrete construction on the "Wells" system has been introduced with much economy in space and constructional advantage. Low-pressure heating, by Messrs. Haden, of Trowbridge, has been installed throughout, combined with a natural system of ventilation, and has obtained eminently satisfactory results. The operating theatres are specially and separately treated, and have an installation of powerful electric fans. A feature internally of the ground and first floors are the spacious main corridors with cement concrete groined ceilings. Mr. C. Hadfield and Mr. C. M. Hadfield have collaborated on the design and carrying-out of the buildings. Mr. Edward Lewtas has acted as clerk of works for the present buildings. The present and more recent portions have been erected by Messrs. George Longden & Son, Ltd. The reinforced concrete work has been done by Stuart's Granolithic Stone Co.

Mr. Charles King, F.R.I.B.A., Plymouth, has prepared revised plans for the King Edward Memorial Pavilion, to be erected at Didworthy for Plymouth phthisis patients. The foundation-stone will be laid shortly

NTH INTERNATIONAL CONGRESS OF ARCHITECTS, ROME, OCTOBER 1911.

the courtesy of the Council of the Society of Architects
we are enabled to reproduce the report of the Society's
al delegate, Mr. R. G. Lovell, member of Council, pre-
d and adopted at the twenty-seventh annual general
ing of the Society, October 19, as follows:—

o the Council of the Society of Architects, London.

entlemen,—On Tuesday, October 3, I attended as your
ate the inaugural ceremony of the ninth International
ress of Architects in the Hall of the Horatii and Curiatii
e Capitol, Rome. The Minister of Public Instruction
med us in the name of the King of Italy, and Sir
y Tanner, as the delegate of the British Government,
nded on behalf of his fellow-countrymen.

was also able to attend the five sessions of the Congress
e Congress Hall and offices adjoining the Castle of St.
lo. A translation of the subjects discussed and the
itions carried is appended.

*ubject VI.—The desirability of a dictionary of compara-
architectural terminology.*—This was made clear and
omprehensive nature of the proposed international
onary will be realised by referring to the trial sheet here-
The Congress resolved that the Permanent Committee
d undertake this work and that the text should be supple-
ed by illustrations.

ubject IV.—Considerations as to Modern Architecture.
veral papers were read of widely divergent views; but
expressed and unexpressed opinions of the members
so varied and antagonistic that it was found impossible
rmulate any resolution.

*ubject III.—The technical and artistic education of the
itect and the Architect's diploma. The exercise of his
ssion beyond the limits of his own country.*—Consider-
interest and excitement was created during the discus-
following the paper read by Monsieur Albert Louvet
ior of the Grand Palais des Beaux-Arts). M. Louvet's
were embodied in five resolutions; the first one being
e effect "that the right to practise architecture should
ee in all countries." This appeared to be entirely
sed to all ideas of registration. Neither the paper nor
resolutions had been printed or translated, and the
sity of following the discussion in four languages made
y difficult for the bulk of the members to properly appre-
the importance of this proposal. Your delegate was
orted by Mr. W. E. Riley, the delegate of the London
ty Council, and strenuously opposed any voting being
that day, until members had had an opportunity of
erly understanding the resolutions. Although M.
et was willing to delete this first resolution, there was a
derable number of members who insisted upon a vote
taken. Fortunately, however, we were able to main-
our objection by a small majority, and the contentious
e was struck out. It will be noted that this resolution
dmit of another construction—namely, that an archi-
hould be free to practise his profession beyond the limits
s own country; but the discussion was so involved and
vording so ambiguous that the British and American
ngents considered that it was more prudent to adopt the
e we did. During the whole of this very important
ssion, which referred principally to the education of
rchitect, I heard no reference whatever made to the
sity of any form of commercial training.

xtra Subject.—Copyright.—The resolutions were passed
ically without any discussion. They had been carefully
ılated by Monsieur Daumet, the honoured President of
Permanent Committee; Monsieur J. M. Poupinel, the
tary-general; and Monsieur Georges Harmand, advo-
and member of the Permanent Committee. The work
dy done in England appears to entirely cover these
itions.

ubject I.—Reinforced concrete.—Several interesting
s were read, including one by Mr. W. E. Riley,
I.B.A., which was very well received; but it was felt
the study and development of this material from an
tic standpoint had not made sufficient progress, and
s decided that the Congress should record no vote on the
ct.

veral papers were read on—

*ubject II.—The duties of the Architect with regard to
mployer.*—A very heated discussion arose when it was
that under certain conditions an architect should be
itted to accept payments from the builder. Mr. John
r, B.A., F.R.I.B.A., made quite clear to the Congress
trong views existing in our country upon this point. There appeared, in other countries, to be a certain justification for this custom. For instance, it was shown that in Spain the responsibility for the stability of a building was fixed by law upon the builder, consequently it was usual in big buildings for him to employ an architect to protect his interests, while the property owner employed another architect who was usually responsible for the design and also for the foundations. The discussion brought to light so many varied views that the Congress only voted upon the main issue—namely, "that the architect should under no pretext receive fees except from his employer." The further study of this important question was referred to the Permanent Committee.

I append a translation of the paper contributed on this subject by Architect Baumann, entitled "The Principles to serve as the basis of a Bill regarding the legal protection of the Architectural Profession."

Subject VII.—Foreign Academies in Rome.—Although the American, Spanish, and French delegates shortly described the work which their academies were doing (principally that of research), no announcement was made as to the great work for the establishment of a British Academy in Rome. This ambitious scheme Mr. J. W. Simpson has been fathering for some time, and although his earnest efforts appear to be on the point of realisation, he considered it more prudent not to imperil the ultimate success of the enterprise by any premature disclosure. It is undoubtedly a most praiseworthy undertaking and one that claims the cordial support of all those who aim at raising the standard of architectural training in the British Empire.

Subject V.—The carrying out of Architectural work for the State or other public bodies.—This proved possibly more contentious than any of the other subjects. The matter had been exhaustively discussed and a decision arrived at at the last International Congress in London. The London resolution was attacked, on the one hand, by those members who desired to have a distinction drawn between the architect and the engineer, and, on the other hand, by those who wished to have a distinction drawn between the official architect and the private architect. The bulk of the British members had considered it wiser to support the resolution of the London Congress and to ask that no fresh vote should be taken, but, upon it being decided to take a vote, they felt free to follow their individual opinions and most of them considered that "all public works of a monumental character should be open to public competition and not be designed by the official architects." A great deal of confusion arose in framing the various resolutions and amendments and in properly translating into the four languages; consequently, in recording the various votes the resulting resolutions are somewhat involved, although they represent what your delegate and the bulk of the British and Americans voted for. The official architects were naturally opposed to the last resolution and, in the confusion, a protest was lodged with the President, objecting to this resolution on behalf of the British members. I am quite satisfied, however, that the bulk of them did vote and approve, and do now approve the resolution as it stands at present—namely, "That with the object of obtaining monumental buildings embodying all the essentials of art, the schemes in all cases must be prepared by qualified architects and, before the work is put in hand, the schemes must be submitted to the approbation of an institution such as the Académie des Beaux-Arts or to committees the majority of whose members are architects."

Earthquake Commission.—The resolution asking the Government of Italy to take the initiative in this matter was passed without any discussion.

Next International Conference.—It had been exhaustively discussed by the Permanent Committee and decided that the next Conference should take place at St. Petersburg in 1914. A cordial welcome was promised by the Count de Suzor, the delegate from the Russian Government, to all those who would go. It is suggested that the Conference should take place in the winter during the period of the high season at St. Petersburg. The general meeting of the Congress unanimously confirmed the decision of the Permanent Committee.

We were given to understand that only about five hundred members and associates had inscribed, but no official list was forthcoming before we left Rome. The British numbered about seventy, and we believe they were the most numerous, being closely followed in numbers by the Germans. It is said that many absentees were occasioned by the exaggerated reports of the seriousness of the plague in Italy, and in addition many Roman Catholics declined to attend a Congress held as part of a festival to celebrate the fiftieth anniversary of United Italy and the abolition of the Papal temporal power.

It was evident on all sides that our hosts and confrères, the Italian architects, did everything in their power to render our stay agreeable and entertaining. Possibly, we Britishers were too exacting in requiring the Congress meetings to be of a more formal character. It was repeatedly stated that the London International Congress and the Town Planning Congress were so excellently organised that it made it almost impossible for any other city to approach them. On the other hand, we found that the generous hospitality of our hosts filled up every moment of our time to overflowing, and certainly there appeared to be more to be learnt outside than inside the Congress Hall. I therefore refer to some of the functions that your delegate was privileged to attend.

St. Angelo.—This monument of Imperial Rome forms part of the International Exhibition. The Congress Hall and offices are constructed in the adjacent grounds. An interesting show of retrospective art is on view both inside the castle and in the buildings surrounding it. This becomes entirely dwarfed by the dominating influences of the towering mass of masonry, constructed by the Emperor Hadrian for his tomb and for that of his successors. The travertine cylinder of 80 yards diameter was originally faced with marble and with columns and entablature surmounted by numerous marble statues. Its present appearance is that of a mediæval fortress, and its present name was bestowed by Pope Gregory the Great in 590, when he beheld the Archangel Michael sheathing his sword above the castle.

Santa Prisca.—Mr. Filippo Galassi, one of the Permanent Committee, was kind enough to include your delegate in an invitation to a luncheon here, which he offered to Sir Henry Tanner, Mr. John Slater, Mr. Collcutt, Mr. A. E. Murray, and Mr. Henry Tanner. Santa Prisca is on the slopes of the Aventino, with beautiful views on to the ruins of the palaces of the Cæsars on the Palatine Hill, and across these and the modern city to the distant Albani Mountains. In the valley at our feet could be traced the form of the mighty Circus Maximus, greatest of the stadia of ancient Rome, first erected in the time of the Tarquin kings and subsequently enlarged by the emperors to accommodate over 200,000 spectators. Mr. Galassi conducted us down to inspect the Cloaca Maxima, formed before the time of the "Rape of the Sabine women," to drain the swamp between the Capitol and Palatine Hills, and it is still used to drain a part of the city—a period of over 2,600 years. Mr. Galassi also explained that it is now established that the ancients only employed the famous long Roman bricks for arch and vault construction. The bricks that are now found in wall construction are only broken pieces which had been previously employed in some demolished building.

Victor Emanuel Monument.—This great work, designed by Count Sacconi, suggests many reflections. The bulk of the sculpture, parapets, pedestals, &c., are at present only in plaster. Since 1885 the work has been progressing, and it was hurriedly completed in the present temporary manner for the celebrations this year. Many important modifications can, therefore, be made in the completed work. The main relief on either side of the standing figure of Peace is actually in duplicate, divided into sections and ingeniously hung on internal rails so that one design can be slid behind the other. By this means the public has the opportunity of judging the work of both of the first competitors *in situ.* Needless to say, no expense is spared. We had the opportunity of judging the work from the roof to the basement. The honeysuckle ornament on the highest cornice is as well finished as if it were being used at the eye level. Many of us felt that, grand and mighty as the monument appears in mass, greater dignity still might have been obtained if less ornament had been employed in the lower part; and some of our number considered that one or two less columns in the colonnade would have improved the spacing and widened the end porticos. Mr. Galassi was able to let us see the various models prepared during the progress of the work. The original one made by Count Sacconi appeared to us much the more noble. The lower part was heavily rusticated and with only one centre opening and very little ornamentation. The whole building was three or four metres less in length with two less columns, and consequently wider spacing in the colonnade. The existing modifications became necessary in consequence of an important development when getting out the foundations. The construction is erected on the northern slope of the Capitol Hill, and it was found that what was supposed to be solid rock, only requiring a facing to be fixed, was so honeycombed that it had to be cleared away and high halls were formed, necessitating the vari
windows and openings which now exist. For similar reas
the N.E. end had to be extended. While admiri
the magnitude of this colossal monument to a great King
comparison was drawn with the monument, erected in L
don, to a great Queen; while bounding over the ruts of
ill-kept streets, another comparison is drawn as to the m
utilitarian expenditure of public money in our own count

The Capitol.—A brilliant reception was held at t
historic spot on the invitation of the Syndic. The th
buildings surrounding the antique bronze statue of Mar
Aurelius are at present united at the two angles by w
and plaster constructions, repeating the façades designed
Michel Angelo. This enabled the guests to circulate fre
between the well-known collections, which were all seen
very great advantage by the aid of our well-informed c
rones. One interesting fact was brought home very clea
to us. We found ourselves admiring frescoes and decorat
features of the fourteenth and fifteenth centuries on
walls of a building designed by Michel Angelo, but
executed until after his death in 1564. This was explai
by hearing that his façade had been applied to a mediæ
building of the thirteenth century.

Lectures.—Commendatore Boni, who is the curator,
is in charge of the excavations of the Fori, gave an inter
ing lecture, with slides, on the Forum of Trajan—the hig
development of Roman art. He described his discovery
the grave of Trajan at the base of the column, and
method he had adopted for determining the exact len
of the Roman foot, 100 of which represent the height of
column, including the pedestal. This also represents
depth of earth removed from between the Quirinal
Capitoline Hills. Professor Boni has found that 27.
metres represent the exact length of 100 Roman feet, roug
91 English feet, instead of about 97 English feet as
viously supposed. Professor Stübben also gave a lecture
slides on town planning, similar to the one he gave at
London Town Planning Conference. He described
garden cities of England as the apogee of domestic work,
claimed that in Germany they were making great adva
in the town planning of towns.

Palazzo Colonna.—A luncheon was offered by the Orga
ing Committee to the delegates in the Pavilion of Pal
Colonna, and afterwards we were escorted through
famous picture galleries and gardens. Here we saw a f
ment of a colossal architrave, believed to have been pa
the main entrance to the Temple of the Sun.

Villa Albani.—With the permission of Prince Torl
an afternoon reception was held in the beautiful gar
and in the galleries of antique statuary.

Villa del Vascello.—A delightful garden party was g
by the Marquis Luigi Medici del Vascello. The view
the tower over Rome and the Campagna was most exten
The original Villa had been destroyed when the Fr
attacked Rome in 1849, and we had the pleasure of b
presented to an old gentleman who had helped to defen
place and was one of the veterans of Garibaldi.

Villa Borghese.—A whole day was spent in and a
this beautiful gallery and park which encloses the
Zoological Gardens. These certainly are the most real
in the world. The large animals are not confined in c
but have an open space allotted to them in which they
free to roam; the back part of this enclosure is forme
wonderfully realistic overhanging rocks with caves or
and interspersed with cacti and other tropical plants; ap
ently there is nothing but a slight wire fence to sepa
the animals from the visitors. Courage seems to ooze
beneath one's boots while watching a couple of roaring
apparently about to choose their meal from among the
tators, of which you happen to be one. The same prin
is employed here as at Hamburg, but the results obtain
Rome are much finer.

The Ethnographical Exhibition is a most comprehe
collection of typical buildings of each Italian prov
correct in every detail, both inside and out. To an arch
tural student there are gathered together in the P
d'Armi samples of all the motifs and details that he w
have to search the whole of Italy to discover. It is gene
admitted that nowhere has better reproductive work
seen.

The Fine Art Exhibition is also admitted to be the
international collection of pictures ever gathered toge
and, to lend additional interest, the exhibits of most o
larger countries are each housed in buildings specially
structed as typical of the architecture of the country.

tish pavilion is by Mr. E. L. Lutyens, and is founded the upper storey of St. Paul's Cathedral. It is most tifying to know that, on all sides, it is admitted that the tish collection is by far the best in the Exhibition. One urious to know how such a very excellent and comprehen- collection was gathered together. All phases of British seem to be represented. The pre-Raphaelite men form emarkable gathering. Although the collection in point number and quality surpasses any other country, the hod of display is entirely eclipsed by the methods adopted Hungary, Germany and Austria. The exquisite plicity of the whole interior arrangement and the careful ging of each individual picture is a study in itself. tainly the British Pavilion would have required enlarg- to three or four times its present size to have attempted thing like it.

Model of Ancient Rome.—This is the work of Monsieur Bigot, who has spent seven years in careful study with foremost archæologists and in completing this wonderful roduction of the Imperial City in the fourth century A.D. s built to a scale of 1 to 400, and covers an area of ut 150 square yards. Only the centre part of the city iown, but it is sufficient to include the Baths of Caracalla the south to the Mausoleum of Augustus on the north, from the Aventine Hill on the west to the Quirinal on east. Nothing can equal this ambitious work as a means reconstructing the general aspect and topography of the ital of the world sixteen hundred years ago. Every ail of historic or architectural interest is shown. The itheon, rebuilt as at present, but standing amidst the hs of Agrippa; the house where Julius Cæsar was mur- ed at the east of Pompey's Theatre; the river Tiber ing from north to south and skirting the city on the t; the busts known to have existed in the upper storeys he Colosseum and the colossal statue of Nero from which name is derived; the barracks for the sailors employed ig the sun-awning to protect the spectators; the barracks the gladiators and arenas in which they practised; the nan Forum in every detail excepting, of course, the well- wn Phocas column erected some four hundred years later; Cæsars' Fori and their palaces on the Palatine; the itol; the Baths of Constantine; the altar on the Quirinal, ed to mark the spot where the burning of the city was ested. Facing this is the Doric Temple, on the spot where nulus appeared to the Romans after his death, telling m that he was to be deified under the name of Quirinus. this spot now stands the Quirinal Palace of the Kings Italy. After studying this model, modern Rome takes quite another aspect. We can live back in the days of Republic or of the Empire. The present busy Corso is itically the same as the Via Lata and Via Flaminia. Column of Marcus Aurelius is in the identical spot that vas, and the busy Piazza has practically the same form. enormous solarium or sundial has now disappeared. It situated between the column of Marcus Aurelius and Mausoleum of Augustus, and was formed by a marble ement inlaid with bronze lines. The gnomon was formed an Egyptian obelisk of the seventh century B.C., which stands facing the Chamber of Deputies. The mere con- plation of the photograph and plans, herewith, is most inating. When the lights were adjusted to give a moon- it effect or the effect of the rising or the setting sun, the ilt produced in silhouetting the contour of the ground the buildings was most impressive. So impressive, that elieve among many it will be the last picture to fade n the many pleasing impressions we carried away from Ninth International Congress of Architects in Rome. excellent arrangements made for the comfort of the nbers by Mr. John W. Simpson, F.R.I.B.A., the Hon. retary, British Section of the Permanent Committee, were itly appreciated, among others by—Yours faithfully,

(Signed) R. G. Lovell.

RANSLATION OF THE RESOLUTIONS PASSED.

First Meeting.—October 4.

Subject VI.—The desirability of a dictionary of compara- architectural terminology. The following resolution carried:—

The Congress recognises the desirability of a dictionary comparative architectural terminology, and resolves that Permanent International Committee of Architects should anise an International Commission who shall continue work commenced and present its work at the next Inter- ional Congress.

The Congress is of opinion that drawings and sketches should accompany the text in order to make the definitions clear.

Subject IV.—Considerations as to Modern Architecture. On this subject the Congress was of opinion that no resolution should be voted.

Second Meeting.—October 5.

Subject III.—Technical and artistic education of the Architect and the Architect's diploma. The exercise of his profession beyond the limits of his own country. The Congress carried these resolutions:—

1. That the right to use the title of Architect should be reserved to those who have obtained it as a result of a proper examination passed after an artistic, technical and scientific education.
2. That the title of Architect should be placed in the same rank as the title Master of Arts, Doctor of Medicine, &c.
3. That the schools of architecture may be varied in different countries, while adhering to the same general rules.
4. That students should not be able to enter schools of architecture until after having obtained in previous schools the same general culture or a similar culture to that which is required in the other professions.

Extra Subject—Copyright.

The Congress draws attention, on the one hand, to the resolutions on copyright made during the last thirty-four years at the International Congresses of Architects and also at the International Congresses of Literature and Art; notably at Madrid in 1904, at London in 1906, and at Vienna in 1908.

The Congress draws attention, on the other hand, to the progress accomplished during the last thirty-four years in European legislation for the protection of architectural works, notably the Spanish law of 1879, the French law of 1902, the German law of 1907, and the Convention of Berne, 1886, and by the Conference of Berlin of 1908, and the Congress also draws attention to the resolution made at the International Art Congress held in Rome in April 1911, when uniform protection was declared legitimate for all works of art, including architecture, during the life of the author and at least for fifty years after his death.

The Congress resolved:—

1. That architectural work should be protected in all its artistic aspects.
2. That architectural designs, including the designs of exterior and interior façades, the plans, sections and elevations and the decorative details, constitute the first evidence of the thought of the architect and of the architectural work.
3. That the building is only a reproduction, on the ground, of the architectural design.

The Congress confirms the resolution that architectural work, and all the designs which compose it, together or separately, also that the construction and all other reproductions, should in all International Laws and Conventions be protected during the life of the author and during a minimum period of at least fifty years after his death, in the same manner as all artistic works of painters, sculptors and others.

Third Meeting.—October 7.

Subject I.—Reinforced concrete, the mode of using it in different countries and how it may be applied to great buildings as regards the technical and the decorative point of view.

On this subject the Congress determined to pass no resolution.

Fourth Meeting.—October 9.

Subject II.—Duties and rights of the architect with regard to his employer.

First resolution. The Congress decided that the architect should under no pretext receive fees except from his employer—State, town, administration, or individual.

2.—The Congress decided to refer the further study on this subject to the permanent committee.

Subject VII.—Foreign Academies in Rome: Their history, the studies and works of the pupils, their influence in their respective countries.

No resolution was passed.

Fifth Meeting.—October 10.

Subject V.—The carrying out of architectural works for the State or other public bodies.

The Congress repeated and confirmed the resolution made in London in 1906. The Congress considered that it was necessary to carefully observe in principle a very clear division between the practice of the art of the architect and that of the engineer, and consequently the following resolutions were passed:—

1. That architectural works intended for the State, municipalities, or other public bodies should only be entrusted to qualified architects after competition or otherwise.

2. That with the object of obtaining monumental buildings embodying all the essentials of art, the schemes, in all cases, must be prepared by qualified architects and, before the work is put in hand, the schemes must be submitted to the approbation of an institution such as the Académie des Beaux-Arts, or to Committees the majority of whose members are architects.

Extra Proposition.

The Congress begs the Government of Italy to take the initiative in the formation of an International Commission of representatives of countries subjected to earthquakes in the following manner:—

a. To unite all the studies and the works which have been made, and are being made, in all that concerns earthquakes, and also the stability of buildings in earthquake countries. *b.* To elaborate general regulations and local regulations for constructions to be built in these countries; and to require the representatives of the foreign countries present at the Ninth Congress of Architects to ask their respective governments to create seismatic stations, where they do not yet exist.

And to ask that the earthquake commissions should be composed not only of learned geologists, but of architects and engineers, in order that these commissions may, by their work, contribute to the technical and artistic solution of the question of stability of the constructions in earthquake countries.

THE ARCHITECTURAL ASSOCIATION.

(*Concluded from last week.*)

AFTER the reading of Mr. Raymond Unwin's paper on Town Planning on October 16, the following discussion took place:—

Mr. S. C. Ramsey said that the word "regular" as applied to towns, he took it, meant that which had been planned to a preconceived system; while the word "irregular" meant that which had been built up unit by unit, being no part of a complete scheme and controlled only by immediate requirements. Obviously any preconceived system must provide for and meet all the conditions of the problem. The American gridiron type was a very elementary idea of a formal plan. St. Louis, Chicago, and Washington are all now considering schemes of reconstruction in order to avoid the defects of their original lay-out. That curved lines of plan and undulating surfaces were not incompatible with formal design was illustrated by Edinburgh, which, according to Craig's plan, was to be a formal town on hills. There seemed, broadly speaking, to be three different types of towns. First, there were the types of cities or towns that have been built on ordered and regular lines. In recent times for instance there were the plans of Haussmann for modern Paris, of L'Enfant for Washington, and of Craig for Edinburgh. Both the Greeks and the Romans seem to have realised the mistakes in their confused capital cities, for in their colonial cities one finds often absolutely regular and formal plans. Among such Greek cities are Ephesus, Miletus, Priene, and Rhodes; and in Roman cities are Treves and Silchester. The second class are towns or cities that have grown fitfully, either entirely uncontrolled or controlled only partially, such as ancient Rome and Athens and most mediæval cities. Rome was unity itself in the lay-out of separate buildings like the Forum, baths, and public places. These symmetrical units, however, were unsymmetrically arranged. The third type of cities is a combination of the two previous types in which the formation was partly due to growth and partly to pre-arranged planning. Under this head come most modern towns, such as London, Dublin, Glasgow, Bath, Ramsgate, Margate, Hastings, and Dublin. In London one must particularly regret the loss of Wren's plan. The confusion of the central part of the metropolis should be contrasted with the comparatively well-ordered west and south-west districts which possess such centres as Cavendish Square, Portland Place, Regent's Park, Regent Street, Belgrave Square, &c. The desire for formality is shown by both ancients and moderns, and no city of any importance has ever been purposely laid out on any but formal orderly lines. The basis of town planning to-day is the question of population. The opportunity of building an entirely new city hardly ever presents itself. We are now chiefly co
cerned with city improvement, or re-construction and d
velopment, and in providing for sections of the communi
as in garden cities and suburbs. The real aim of all su
efforts is the creation of a delightful environment. T
advantages of the formal or preconceived type of town pla
ning in dealing with modern problems include the followin
the proper distribution of a city into residential distric
by zonification or stratification, business districts, comm
cial zones, park systems, and pleasure places; the provisi
of proper communication between the parts; the anticipati
of traffic problems; the consideration of future extensio
and the grouping of buildings with reference to their relati
use. It was a pity that Mr. Unwin in his paper did n
dwell at greater length on the position of the architect
relation to the town and the architectural expression su
able to a town planned on formal or regular lines.
himself would venture to suggest that the more importa
buildings alone should demand conscious attention, leavi
the rest to be subconsciously felt. This is illustrated
comparing the modern streets of Paris with the mode
streets of London. In going up the narrow streets of
cathedral town we see the fine general effect of the rich co
fusion of lines, both vertical and horizontal. The dang
of individualism lie in the resultant loss of monumental a
architectural effect. For an example of this one mig
compare the Regent Street of ten years ago, when it w
a type of formal architecture, with the present Kingsw
In his inaugural lecture on Civic Design at Birmingh
University Mr. Raymond Unwin, when speaking of
architect, declared that he may in the design of his bui
ing consider the total effect of the town as more importa
than the individual prominence of his own buildi
Again, Mr. Unwin in the paper just read had said in ref
ence to the influence the town-planner should exert on
buildings which go to make a town:—"He will be able,
a greater or lesser extent, to influence the result by det
mining the position of main buildings, and sometimes
fixing frontage lines, and limiting the heights and char
ter of the building." If the architect can accompli
this he will have achieved a noble work, and have done m
than anything else to bring about the unity of expression
our towns and cities which should characterise the work
a great and progressive nation.

Mr. W. Curtis Green, F.R.I.B.A., said he had recen
re-read a very interesting paper entitled "Comparat
Desirability of the Formal or Irregular Treatment of Str
Architecture in Large Cities." It was by Mr. A. Mary
Watson, and won the Royal Institute essay medal in 19
The paper seemed to have a great deal of wisdom and shre
ness, and to be well worthy of being read by all studer
Mr. Maryon Watson had many interesting things to
about the formal and irregular. One of the points m
was that there were two different sets of people to be c
sidered: one was the man in the house, the other the man
the street. In his (the speaker's) opinion, now that arc
tects want to work towards some definite scheme, there w
a great many difficulties to contend against in the for
movement. Regent Street, for instance—our finest exam
of a formal treatment—was gradually being destroyed.
city development was a question of use, and architects
to decide whether their work was to be of a perman
character or whether their buildings were to be taken do
when the immediate use was at an end. It was necess
to understand that in this formal movement there was so
thing more than the mere formal architecture.

Mr. G. H. Jenkins said that there were one or two thi
in Mr. Unwin's remarks which struck him as being cont
dictory. For instance, many of the views he had shown
the screen showed a formal plan around a building fad
away into informality in the gardens. It seemed to b
fine thing, if the centre of a town were planned on for
lines, for it to become less and less regular as the hou
got further into the country, where there is more opp
tunity for making the lines informal. Nearly all the
amples given on the screen suggested two ideas. One wa
fine formality, and the other was absolutely at the oppo
end of the pole. That variety seemed to him to be
crux of the whole matter.

Mr. A. E. Richardson contended that irregular to
planning competed with nature, and in doing so betra
its own littleness, while the formal line struck a contrast,
was to be seen in many great cities in England, and in Ed
burgh. He noticed that Mr. Unwin had displayed on
screen views of only German and foreign architectu
London's architecture was comparatively unknown to m
people. He would recommend a study of the squares

elgravia and Bloomsbury, and a comparison of such a ondon building as Somerset House with any of Paris. ost of the London squares had been built around fields hich, instead of being built upon, were enclosed. These reets were self-supporting, and formed residential centres all that was best. In his opinion London offered some of e best examples of town-planning in the world. If irre- lar town-planning was cited he would refer to the setting the Royal Exchange. Here the streets were allowed to cut most awkwardly.

Mr. A. E. Bullock, A.R.I.B.A., pointed out that in the dy of town-planning they had to go back a very long way deed. He was, therefore, particularly pleased to see nong the lantern views a restoration of Ephesus. They ked on Hippodamus of Miletus, who was employed by the reeks towards the end of the fifth century B.C., as the ther of town-planning. The Greek plans were based on a ry clever idea. They were regular, and the axial lines re treated in a manner the present generation hardly alised the beauty of. When one came to Continental and glish town-planning, it is found that little advance has t been made in the matter of the traffic problem. The nk of England, for example, and Cheapside, are a con- ual trouble to the police. Town-planning, indeed, ap- ared to have been regarded from many points of view, but t from that of the traffic. It seemed curious that no one d thought of a good way out of the traffic difficulties. ren's plan, if carried out, would have prevented much of e present congestion. He quite agreed that attention ght to be paid to what had been done in the past in the est-End of London. Much of it was very clever. The escent, for example, helped very much in the lay-out. ound railway stations the roads ought to be wider.

Mr. C. G. Boutcher, A.R.I.B.A., totally disagreed with e statement by Mr. Unwin that the same principles applied a small garden suburb as to a large city. In his opinion e two were in direct opposition. A city was a thing of owth, and it was impossible to plan a city knowing exactly at would happen in the future. A week-end cottage did t include the problems as to axial lines that a large mansion l. The garden suburb should be planned so as merely to ke usefulness into account, as in the designing of small uses. But in the large city, where one was treating the mmunity as a whole, the formal treatment comes in. It uld be, in his opinion, limited to that.

Mr. F. M. Elgood, F.R.I.B.A., said the main impression had derived from the paper was that there could be little nder if every one was in favour of a formal plan, chiefly cause in formal planning one could see very definite results, d sometimes very magnificent results; whereas with in- rmal planning one cannot say how much of the effect is e to the designer and how much is probably from acci- ntal causes. The view given of Amiens Cathedral, with e buildings piling up around it, was, of course, instructive d very fine, but it had arrived in that way more or less accident. He did not expect that any one present would in a position to prepare plans for a new city except on per. But there were many practical opportunities offered the planning of garden suburbs. The previous speaker d insisted on the undesirability of formal designing for ch occasions, and especially on the absence of need for long, aight street lines in a small area. But he (the speaker) ieved that even if they began with a formal plan they uld have to turn eventually to the informality of the non- aight line. Another way of breaking up formality was break the frontage lines, so as to bring portions forward as to form what was something like three sides of a quad- ngle. With regard to the height of buildings, whereas re did not seem to be much room in the case of garden burbs for discussion or need for control, in city-planning re seemed to be very great need to keep down the height. gent Street of to-day was very different from the Regent reet originally planned, and the enormous height of the w buildings will gradually destroy entirely its effect. It uld be a very interesting subject to discuss how far the aracter of a building should be controlled in town- nning. He himself did not think it at all improbable t presently some provision may creep into such schemes, d architects will wake up to find that their designs must approved by some body more or less incompetent. If such tep could be brought about by architects taking the initi- ve, it would have a very desirable effect.

Mr. Gerald C. Horsley, the President, in closing the dis- sion, said it seemed to him that the balance of opinion s more in favour of formalism than of irregular town- nning. He would quote the following extract from a per read by Professor Haverfield, perhaps the greatest authority on ancient Roman work, at the Town-Planning Conference:—"Ancient life differed from modern in nothing so much as in its preferences for set and almost crystallised forms within which to express itself. This is especially seen in the form given to the town. It was an old form—the familiar rectangular street plan. That, I think, is the town plan which in all ages, till twenty or thirty years ago, men either invented or instinctively borrowed for their systematic town-planning. We meet it in early China, and in Greece from the fourth century B.C., and in mediæval England, and in many modern towns across the seas. The square and straight lines are, indeed, the simplest marks which divide man civilised from the barbarian!" That was a very interesting statement, and it explained, perhaps, the general preference for formalism in town-planning. The same feeling to have things done decently and in order is seen in the quotation made by Mr. Unwin of Ruskin's dictum about liberty. How necessary it was to confine one's actions within certain definite lines; how impossible to go through life without some distinct principles!

A vote of thanks was then passed by acclamation.

Mr. Raymond Unwin, in replying to some of the points raised, said that possibly he ought to have mentioned in his paper the different principles in favour of town-planning put forward in Germany. It was sometimes thought that formalism in the past arose by accident. Rather it arose from the fact that every one was working in one style with one general instinct, and did what was right in the particular style and time and particular opportunity. That was not quite the same thing as accident. Indeed, it approached nearer to the conditions which govern natural growth than any other condition existing in architecture. Whether architects would ever be able to work more freely because of a greater allegiance it was impossible to say. Nowadays the town-planner was handicapped by the knowledge that he possesses no idea what the next architect may desire to do. The argument put forward that there should be a difference between the planning of the suburbs and the centre seemed to him a very dangerous one. There was no sense in the statement that because one got away from the centre one had to be informal. In his opinion there ought to be the same formal plan, while bearing in mind the different class of buildings. He entirely agreed with much that had been said about London, where a great deal of useful work had been done. But not so many useful examples could be found in England as abroad. It would be unwise to go off into questions of conveniences for traffic or the distribution of areas, as both these matters were part of the useful function of a town plan, whereas that evening they had been considering rather the character of the expression of that useful function. The town plan is a bad one if it is bad for traffic and unless it satisfies all such requirements.

The next meeting of the Architectural Association will be on October 30, when Mr. H. H. Hill, B.A., will read a paper, to be illustrated by lantern slides, entitled "A.A. Excursion to the Loire, 1911."

ENGLISH MEDIÆVAL ARCHITECTURE.—II.

THE second of the course of lectures at University College, Gower Street, W.C., by Mr. Edward S. Prior, F.S.A., F.R.I.B.A., was given on Thursday afternoon, October 19.

Mr. Prior said that his first lecture had been one of verbal assertions. In all the others he proposed to set out his views pictorially.

The history of English architectural style started in the dark ages that followed the withdrawal of the Roman legions; its first steps would be intimately connected with the foundation of Christianity among the Saxon and Anglian settlers, who had driven the British to the western borders. During the four and a-half centuries between the coming of St. Augustine and the coming of the Norman Conqueror architecture in the British Isles had little or no creative life, and in building construction contributed little to the mediæval developments. In the Anglo-Saxon stone churches and in the Roman buildings which preceded them the forms of architecture were borrowed, and the experiment of native craftsmanship and constructive skill was retrograde rather than advancing. Indeed, all the earliest Romanesque in North-west Europe must be regarded as ineffectual so long as its ambitions were stereotyped to the idea of reproducing, as far as it understood them, the effects of the Imperial architecture that still loomed grandly in the memory.

Yet this period must not be omitted. The Saxon arts and the Saxon plannings of churches stand as the special background to English mediæval architecture. That background has its negative quality. There were wanting in England the large Roman remains seen in many French and German provincial cities, as also Roman tradition, which set a standard for Romanesque effort. Rather in the provincial style of Roman building in England there was left a degradation of Classic detail and a simplification of the Classic orders for domestic construction. Columns with their capitals and bases had lost the marble characteristics and showed a preparation towards the strips and balusters of Saxon style.

Bede says that stone-building (Mos Romanus) was brought to this country from abroad by missionaries in the seventh century, and that it superseded the existing wood-building (Mos Scoticus). The Anglian crosses of North England show this foreign origin in their carving. Fragments of about a hundred are left, and they are among the most remarkable monuments that remain in West Europe of the arts of the seventh and eighth centuries. The continuance of the craft of this relief sculpture witnessed to an early Christian civilisation in Northern England. Yet this culture was conditional by its being missionary; the motives of its figure-work and ornament were not native to the peoples of the North, but show figures of classic pose and details from the ivory carvings of Alexandria. So, too, St. Wilfrid's churches at Ripon and Hexham must be taken as the transplantation of an alien architecture. As is the fate of an art of copyists, this early blossom of English art, since it grew from no native constructional style, did not develop any progress.

As far as the carving was concerned, the Anglian art was worse than unprogressive: it grew year by year less accomplished, and finally grotesque. To the age of the Anglian work there succeeded that of the Celtic crosses. From the ninth to the eleventh centuries the British Isles were subject to Scandinavian marauding. It was being continually repaganised and then being brought back to Christianity by the Neo-Celtic or Irish culture. In the later crosses, therefore, both these foreign elements of decorative carving are mixed.

The missionary preaching cross may be taken as the site on which was later erected first the wood church and then the stone one. These early churches were modelled on the two sources from which the pagan Saxons received Christianity. Where the Celtic (or Irish) church gave the missionaries, the sources of style were Celtic. Where the Roman or continental church was the Christianising influence, continental style made the tradition. The Celtic church-building was strongest in the North and West of England. At Heysham, on the Lancashire coast, is an example of a single-chambered chapel that is called the Chapel of St. Patrick, and seems of Irish make. The continental influence may be recognised in its bearing on the earliest church plan of the South of England. Out of these two elements was being developed in a mixed way that English plan which may be called our "small-church" plan, that name distinguishing it from the much more ambitious monastic plan that came to us from abroad with the Conquest and which may be called the "great-church" plan.

In the Saxon building of these "small-church" plans it is convenient to recognise three stages: the first as belonging to the first evangelisation of the Saxons in England and to the two centuries following, which were in northern and middle England times of comparative culture and ease. Representative of this period is the monastic church at Brixworth, Northants, c. 700. Its adoption of Roman models is distinct, and all the features show a close relationship to the first continental missionary churches. The second stage ranks with the times of the Scandinavian and Danish raidings. The constant burning of churches and monasteries gave no chances for the experiments of a constructive architecture in England. Nevertheless to this period is attributed the church of Deerhurst, Glos., with its development of planning beyond the earlier Celtic or Roman types, and above all with its many storeyed and double-chambered tower at the west end. This latter is reminiscent of what they had just begun to do in Germany. The third period of Saxon stone-building came as more peculiarly English in the more established government of the latter part of the tenth century. The church of Bradford-on-Avon embodies the native Celtic traditions of church plan—viz. that of a congregation of small oblong chambers—rather than the open-aisled basilican arrangement which the "Roman" monastic churches had exemplified. Other points of difference are: (1) the square sanctuary (in place of the apsidal east end); (2) the narrowed chancel-arch (as contrasted with the pillared screen of Canterbury or Brixworth); and (3) the projection of transeptal porches (instead of the west work of Deerhurst). In this building the earliest tradition of the Celtic church ran on into the after story of English church-planning.

The Saxon building art is marked by great dexterity, no to say elegance, of craftsmanship as far as the dressing o stone and its piecing together is concerned; but by a non-progressive, because non-constructive, science of building. Particularly the arch is timidly and, from the point of view of construction, ignorantly built; its span is usually kept very small, the arches most often are not properly radiated. Th arch was a formula, not an expression of construction. Th art of buttressing in order to counteract thrust is not understood; the walls are built with external projections that tak the shape of pilaster strips, or they are treated with arcade that show no knowledge of building arches, but are merel decorative adjuncts founded on the tradition of Roman style The workshop in which arose these meagre parodies of Roma detail was that of Charlemagne's northern empire. Our mos native form was the baluster shaft, which is traceable t Roman times. A second Saxon peculiarity appearing her and there in doors and windows was the leaning jamb of Celti origin. Another lingering tradition was its use of larg stones. These characteristics are well illustrated by the towe of Earls Barton, c. 950. In the west tower lies one of th chief points of interest of Saxon architecture. The familia lofty unbuttressed western tower, square, sheer and uncompromising, had its source thus early. The motive for suc Saxon erections must, it would seem, have been primaril that of refuge combined with defence.

In the plans of Saxon times the types of the Englis church were established. The variety of small-church planning grew from mixing the basilican traditions of the earl missionary monasticism with the many-chambered usages o Celtic oblong form. Among these there appears, too, th influence of the cross-plan of churches—a method which wa the adaptation to the purposes of North-west European styl of the Byzantine domed church. This appeared in Saxo plans some time before the Conquest. The most importan Saxon uses which appear afterwards acting on the style o English churches were as follows:—(1) The square-ende gabled chancel; (2) the narrow chancel with its idea of enclosure for the sanctuary; (3) the side porches which we perpetuated in the porches, transepts and chantry projections; (4) the exiguous habit of west doorways; (5) the squa tower, particularly at the west end; (6) the baluster— which evolved the Purbeck marble shaft; and (7) the Iris Viking stone-carving. After the Conquest these elements reappear as a tendency which the subsequent development English mediæval art strengthened and amplified, and s made English architecture a different thing from the continental.

TWENTY-SEVENTH ANNUAL REPORT OF TH COUNCIL OF THE SOCIETY OF ARCHITECTS

(*Concluded from last week.*)

Reports of Committees.

In considering the following reports it should be born in mind that the completion of the various schemes development has been delayed by the negotiations with t Royal Institute.

Literature Committee.—This committee have held si meetings, the following being the principal matters dea with.

The papers read and discussed and addresses given durin the session were:—

1910.—November 17, Presidential address; December 1 "A Great London Improvement Scheme," by G. A. Middleton, A.R.I.B.A. (past Vice-President).

1911.—January 12, President's address to students February 9, "The Turned Lattice Work of Egypt," Colonel F. S. Leslie, R.E. (Hon. Secretary); March 9, "Th Relation of Sculpture and Carved Ornament to Architecture," by W. S. Frith; April 6, "The Evolution of Form i Silver Plate," by Percy Macquoid; May 11, "Hospitals, by A. Saxon Snell, F.R.I.B.A.

Arrangements have been made whereby the Society' Journal will be found in the reading-rooms of the publi libraries in Bradford, Brighton, Bristol, Cambridge, Cardif Derby, Dublin, Edinburgh, Glasgow, Hull, Leeds, Lincol Manchester, Middlesbrough, Newcastle, Norwich, Nottingham, Oxford, Plymouth, Sheffield, Sunderland.

The loan library continues to be well used, a large numbe of volumes having been issued during the past year, the greater part of them through the post.

The library has been reorganised, additional shelving accommodation has been provided, and the books catalogued on the card index system and numbered, with a view to facilitating reference by borrowers and economising the time of the staff.

Gifts of books and donations to the Library Fund have been received from a number of members, authors, and publishers, to whom the thanks of the Society are hereby accorded.

Examination Committee.—This committee have met ten times, the following being the chief items under consideration:—

Examinations to qualify for membership were organised and held during April and October in London, Manchester, Leeds, Cardiff, Birmingham, and Oxford. The number of candidates has considerably increased, but the percentage of successes is still very low.

The following members organised the Centres or acted as Moderators:—London, Colonel F. S. Leslie, R.E. (Hon. Secretary), and Mr. B. R. Tucker, M.R.San.Inst.; Manchester, Messrs. A. J. Murgatroyd (Vice-President, Local Hon. Secretary), and Tom Cook; Leeds, Mr. W. S. Braithwaite (Local Hon. Secretary); Cardiff, Messrs. Cholton James, F.R.I.B.A. (Local Hon. Secretary), and G. A. Birkenhead (Member of Council); Birmingham, Messrs. J. Goodman and E. B. Davies; Oxford, Mr. G. A. Harrison (Local Hon. Secretary); South Africa, Mr. E. H. Waugh (Local Hon. Secretary), and the Board of Examiners of the South African branch.

To fill vacancies caused by the resignation of Mr. James Bartlett, one of the examiners, Mr. Richard Willock, F.R.I.B.A. (Member of Council), was appointed examiner in Subject III. (*a*) Contracts and Specifications; Mr. E. J. Partridge, F.S.I. (Member of Council), in subject (*b*) Quantities and Prices of that section; and Colonel F. S. Leslie, R.E. (Hon. Secretary), was appointed co-examiner with Mr. C. H. Mead (Hon. Librarian) for the correspondence classes.

The examiners' report showed a falling-off in the number of candidates and in the standard of work submitted in these classes.

The following students headed the lists in their respective courses, and have been awarded the prizes offered by the Council:—First year, E. R. Frimston (Old Colwyn), value £1 1*s.*; second year, F. P. Taylor (London), value £2 2*s.*; third year, D. H. Barry (Eastbourne), value £3 3*s*.

The attention of the committee having been called by the Council to the financial loss incurred by the correspondence classes, the committee after due consideration recommended that they be discontinued after the present session, and your Council have adopted the recommendation.

The membership examination scheme as a whole is under consideration with a view to developments and changes, but progress has been delayed owing to the negotiations with the Royal Institute.

Five sets of designs were received in the Travelling Studentship Competition, the subject for which was "A Social Club on a Corner Site." Mr. J. R. Leathart secured first place, and selected Norfolk and Sussex as centres for a sketching tour. Your Council has on the recommendation of the committee approved the work done, and the balance of the award together with the silver medal will be presented to Mr. Leathart in due course. The competition designs were exhibited in London previously to their being returned to their respective authors.

The committee regret that no entries were received for the architectural scholarship.

The committee have approved in principle a scheme proposed by the Students' Committee for more frequent competitions at stated periods, in design, measured drawings, and essays. Suitable awards to be offered.

The details are under consideration, completion having been deferred pending the result of the negotiations with the Royal Institute.

Your Council having adopted in principle the recommendation of the committee, that an entrance examination should be instituted for students, have referred the matter back to the committee to work out the details. The matter is in hand, but further progress has been delayed owing to the negotiations with the Royal Institute.

Practice Committee.—Fifteen meetings of this committee have been held, and the following matters have been dealt with:—

Concerted action has been taken in conjunction with the R.I.B.A. on several occasions where the conditions of public competitions have been considered unsatisfactory, and it is understood that in every case the members of the Society have loyally supported the action of the Council.

A number of cases on points of practice submitted by members have been received and dealt with by the committee.

The committee have under consideration the preparation of a code of ethics in connection with professional etiquette, but progress in this and other matters has been delayed by the negotiations with the Royal Institute.

On the recommendation of the committee your Council memorialised the Liverpool Corporation deprecating any alteration in the Podium of St. George's Hall, such as was threatened by the scheme for the proposed memorial to the late King Edward VII. Your Council suggested that an equestrian statue would in any case be out of place in the position proposed, and that it might be more fittingly placed elsewhere.

The present system of balloting for the election of officers and Council has received consideration, and a scheme has been adopted which will tend to secure greater secrecy in the ballot, and facilitate the work of the scrutineers.

A very large number of applications for membership and studentship have been dealt with, and the committee have under consideration a proposal for future developments, but this has been held in abeyance pending the negotiations with the Royal Institute.

The committee called the attention of your Council to the procedure adopted by the Ecclesiastical Commissioners in issuing detailed designs for Parsonage Houses, together with specifications and bills of quantities.

Your Council after due consideration approached the Ecclesiastical Commissioners on the matter, and have reason to believe that the protest made by them and by others will not be without effect.

On the recommendation of the committee, your Council, with the assistance of the Society's local hon. secretaries, circularised members of Parliament calling their attention to the Copyright Bill as affecting architecture, with the result that a considerable number of them undertook to give the Bill their consideration and support.

Mr. Percy B. Tubbs, F.R.I.B.A., Vice-President, was appointed by the Council of the Royal Institute a member of their committee dealing with this Bill, and was the medium of expressing the views of your Council on the matter.

The Bill has now passed the report stage.

Finance Committee.—This committee have met ten times, and have dealt with all matters involving the finances of the Society.

A building fund was opened at the beginning of the session to which a number of the members very kindly and generously contributed, but this matter in common with others has suffered from the feeling of uncertainty in the minds of members in regard to the future of the Society.

A sum of upwards of £2,500 has been spent on adapting and furnishing the Society's premises, and there remains an unascertained balance to be adjusted before the matter is complete. It has been found possible so far to provide for all the Society's requirements in this respect out of the funds and securities in the possession of the Society without making any permanent charge on the property.

With regard to the finances, it may be stated that during the negotiations with the Royal Institute, your Council submitted the books to the scrutiny of the Royal Institute's auditors, assisted by a member of their Council, with the result that they were satisfied that there was an ample margin of assets over liabilities in the event of the Society being then wound up.

The Society's financial year does not end until October 31, and therefore it is impossible to accurately forecast the result for the year, but it is anticipated that the finances will be found to be in a satisfactory condition, and that the surplus will be increased.

Mr. Ellis Marsland (past honorary secretary) was reappointed honorary auditor for the year.

A matter which your committee has under consideration, but which has been deferred for reasons previously stated, has been the establishment of a sinking fund by means of a policy of insurance, with a view to the repayment within a specified period of the capital expended on the premises.

The committee have had under consideration the cost incurred in carrying on the correspondence classes, and after due consideration expressed the opinion that from a financial point of view the continuation of the classes could not be justified. Your Council thereupon referred the matter to the examination committee calling their attention to the financial question, and as a result of the recommendation of both committees the classes have been discontinued.

General Purposes Committee.—Five meetings of this committee have been held, chiefly for the purpose of organising meetings and visits.

Last November a reception followed by a conversazione was held in the Society's premises, the guests being received by the President and Mrs. Bond, and the members of the Council. The students' prize designs, measured drawings and sketches were on view. The President and other members of the Council of the Royal Institute were present as guests of the Society.

The evening of January 12 was devoted to a smoking concert, and during the evening the President delivered an address to the students. A similar concert was held on May 4.

The twenty-seventh annual dinner of the Society was held at the Holborn Restaurant, on April 28, when some 230 members and their friends attended. A number of distinguished guests honoured the Society with their presence, than whom none were more welcome than the President and other members of the Council of the Royal Institute.

Visits have been made to the following buildings in progress and places of interest:—Royal Automobile Club, New Wesleyan Hall, model dwellings for the Sutton Trust, Festival of Empire (Crystal Palace), Building Trades Exhibition, and Lambeth Palace.

GENERAL.

The year has been one of continued progress and development, but as will have been gathered from the committee's reports, the work of the Society has been seriously hampered by the unfortunate delay in the completion of the negotiations with the Royal Institute.

Important proposals in connection with the extension of the library, the development and reorganisation of the examination and membership schemes and questions affecting every branch of the Society's work have been held up.

LECTURES ON HEATING AND VENTILATION AT UNIVERSITY COLLEGE, LONDON.

THE second of a series of six lectures on the "Real Nature of the Problems in Heating and Ventilating awaiting solution by the Engineer" was delivered by Mr. Arthur H. Barker, B.A., B.Sc., on Tuesday, October 24.

He had in the first lecture considered some of the root problems of ventilation and what constituted good and bad air, and now proceeded to consider the question of temperature requirements, or what constituted good and bad heat. Here also we are very much in the dark as to the truth, and it remains for the engineer to lead the way by providing satisfying conditions, the explanation of and reasons for which could then be left to the scientist. This was the mode of procedure that we had become accustomed to, although only a little thought was necessary for one to realise the saving of time, expense, and effort that would be effected were the men of science—in this case the physiologists—to point out what conditions were necessary to obtain satisfactory results from the point of view of health. Such guidance was, however, not forthcoming, and he remembered the case of the professor who showed that it was impossible, theoretically, to drive a golf ball more than three hundred yards. The following day his unfilial son upset this assertion by accomplishing a drive twenty yards in excess of this distance—a good example of what occurred when the practical person came to test the dogmas of the theorist.

There is no real point of separation between heat and air requirements, for the good properties of breathing air have been shown to consist more in their physical than their chemical properties. For example, the temperature and humidity of air were quick to affect our comfort by their effect on the skin. Many time-honoured theories as to temperature requirements have been exploded, as is evidenced by the change in our ideas regarding what were known as colds. It had been established that we were no more likely to contract colds in a low temperature than in a high one. Consumptives who had undergone open-air treatment in cold climates found that they were not only immune from colds, but were cured of their disease, which was probably due more to the cold than to the fresh air. The effort required on the part of the automatic temperature-adjusting mechanism in their systems, to supply the necessary amount of heat loss, so stimulated other organs that they were virtually enabled to build up fresh tissues by reason of the increased quantity of nourishment which they were thus enabled to assimilate. It had been generally accepted that efficient heating resolved itself into the maintenance of a uniform temperature of 60° F., but here again it became largely a question of custom. What, to some persons, were ideal conditions, produced in others feelings of discomfort, and it was necessary for the engineer to educate the public as to what constituted healthy conditions.

Many persons are not clear as to the true meaning of temperature, for a thermometer could be made to record almost what one wished, especially in taking readings of what was known as "the temperature in the sun." Could there be any accuracy in such a reading when the thermometer was subjected to the direct rays of the sun? The mere coating of the bulb with lamp-black would increase the number of degrees registered to a surprising degree. We must recognise this possibility in dealing with the temperature of a room, which was something between that of the walls, of the air, and of the radiations of any heating apparatus.

Comfort consisted of the extent to which heat was given off or radiated by our bodies. In a temperature of 60° F. an unclothed person would part with eight hundred thermal units per hour, which quantity would be reduced to two hundred per hour when clothed; the exposed surfaces being from eighteen to twenty superficial feet and three and a-half superficial feet respectively in these cases.

It is for the engineer to discover how much of this loss was due to contact or conduction and how much to radiation.

Another condition to be considered in rendering a room comfortable is that which takes into account how the occupants are employed. Hard work, excitement, and emotion all have their effect—differing in degree according to the individual—on bodily temperature. He had said that the heating engineer must take into account the temperature of the walls as well as that of the air. It is a question whether we should aim at producing warm walls and cool air, or warm air, the walls being left to take care of themselves as was the practice at present. His own opinion, backed up by experiments, was that the former set of conditions were to be sought after. His experience was that a room containing uniformly warm air produced an effect of dulness more conducive to sleep than active life, whilst cooler air currents served to keep the brain mobile. What conditions in Nature were found to be most pleasant and bracing? Surely those which existed on a bright frosty day, when the feeling of exhilaration peculiar to such weather was due not so much to the temperature itself as to the change of effect from frost to sunshine.

Passing to the question of economy he thought that it was patent to the thinking portion of the public that the recent announcement that within a given period our fuel supply would become exhausted was a most serious question. It would be the policy of the spendthrift to shut our eyes to this fact and to continue the consumption of our coal supply at the present rate, trusting to the future to solve the problem. So long as this fuel supply lasted just so long could we expect to hold our place as a successful commercial nation. It was now a commonplace that of the fuel used for the heating of inhabited buildings only, at the most, 19 per cent. of its energy was being used. The heating engineer, who was concerned with the 32,000,000 tons consumed annually for this purpose, must discover how to effect a reduction in this enormous waste and how to attain—and maintain—the requisite temperatures with the minimum expenditure of energy. The low cost of fuel had largely contributed to the prevalent waste, and the problem would gain in importance or prominence as this cost increased. Something might be done in the way of retaining the heat contained in vitiated air by extracting its bad properties. The energy wasted in producing heat for industrial purposes might also be collected, transferred, and utilised in domestic heating, where it was only required at low temperatures. The economy of heat-loss was the point where the architect could assist by providing houses of such design and quality that the loss of heat was reduced to a minimum. If a heating engineer were asked to guarantee the quantity of fuel consumption necessary to heat a building it would be pure speculation on his part to do any such thing; for so much depended upon the building itself as to the extent to which heat would leak through its walls and roof. This produced a consequent effect on the fuel consumption necessary to maintain a given temperature. The architect and builder were the best qualified to advance any such opinion, being familiar with the nature and quality of the design and construction of the building under consideration.

FORTHCOMING EVENTS.

Saturday, November 4.

Aberdeen Architectural Association : Intermediate Meeting ; "A Holiday in Central France," by Messrs. A. E. Payne, A.R.C.A., and Robert W. Gibbon, at 7.30 P.M.

Monday, November 6.

Royal Institute of British Architects : Opening Address by Mr. Leonard Stokes, President, at 8.30 P.M.

Liverpool Architectural Society : Opening Address by Mr. Arnold Thornely, F.R.I.B.A., at 6 P.M.

Tuesday, November 7.

Nottingham Architectural Society : Exhibition and criticism of Designs for "A Co-operative Stores in a Mining Village," at 8 P.M.

Institution of Civil Engineers : Opening Address by Dr. W. C. Unwin, F.R.S., President, and Presentation of Prizes, at 8 P.M.

Wednesday, November 8.

Manchester Society of Architects : Informal Discussion, to be opened by Mr. J. J. Burnet, A.R.S.A., Hon. LL.D., F.R.I.B.A., at 6.30 P.M.

Thursday, November 9.

Concrete Institute : Presidential Address by Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A., at 8 P.M.

Sheffield Society of Architects and Surveyors : Paper on "The Architecture of Oxford," by Mr. W. S. Purchon.

ELECTRIFIED MILK—AND WATER.

In the columns of the *Daily Express* many of our readers have no doubt seen a number of articles and considerable correspondence under the subject-heading of "Electrified Milk," with reference to a process now being demonstrated by Mr. Douglas Browne. To the general public "electrified milk" is no doubt an attractive headline, and the possibility of preventing milk from turning sour and going bad is a matter of public health of considerable importance and interest to the community. It seems, however, that there are some people who do not admit that sour milk is necessarily bad, and who even go so far as to assert that sour milk is a cure for many ailments and its use a sure road to long life and sound health. The truth probably is that there are some micro-organisms of a beneficent nature that turn milk sour and others of a virulent character that also produce sourness or acidity. With the preservation of milk, however, we need not greatly concern ourselves in the world of architecture.

We are all aware nowadays that there are good bacteria and evil bacteria, and we need not further pursue the subject of milk than to recognise that absolute sterilisation may not necessarily be an advantage. Architects are, however, deeply concerned with the purification and sterilisation of water and sewage, and Mr. Browne by his process claims to be able to sterilise water and sewage as well as milk and other liquids. This claim appears to be substantiated by the experiments of Mons. Roussel (doctor of the University of Paris and expert to the Paris Law Courts), who has found that cultures of certain typical micro-organisms including bacterium coli and the bacillus of tuberculosis, when treated by Mr. Browne's process, were sterilised, and refused to develope; whilst Mr. Leo Taylor, F.I.C., experimenting with water containing the bacilli of typhoid, found that these also were sterilised by the process.

It must therefore be allowed that Mr. Browne by his process is able to sterilise certain micro-organisms of pathogenic character. Whether he at the same time destroys the activity of any good bacteria is a matter that has so far, we believe, not been investigated by bacteriologists. Nor are we aware personally whether such good bacteria are present in ordinary wholesome water, but from our knowledge of the action of septic tank and allied bacterial treatments of sewage, it is certain that here at least we have micro-organisms of utility to health, and, as water can also be purified—at least to the extent of the removal of pathogenic bacteria—by simple storage for a sufficient period it may be presumed that in ordinary water there are useful or good bacteria.

Many chemical means have of course been employed for the purification of water and the sterilisation of pathogenic bacteria; caustic lime, milk of lime, calcium hypochlorite, iron sulphate, and live steam have all been employed with greater or less success; but whereas these are injurious to fish life, we have it on the authority of the *Daily Express* representative that fish live in water sterilised by Mr. Douglas Browne, so that it would appear that, although the water is sterilised, it is not devitalised or poisoned.

We all know nowadays that hard water can be softened by chemical action, and in this respect also water electrified by Mr. Browne's process becomes soft, and so is economical in soap when used for washing; but there is a great difference in the potability of electrified water and distilled water, for whereas the latter is mawkish, flat, and unpleasant, the former is particularly pleasant and bright.

The electrification of liquids is carried out by Mr. Browne with electric currents of very low voltage passing through suitable electrodes of special composition, which is the principal element of the process. Electricity has been, and is being, used by other processes for purifying water, but these generally operate by the production of ozone from air, which necessitates the employment of very powerful currents of high voltage and frequency. The purification is therefore effected by ozonisation rather than by electrification, and demands special machinery for the production of the powerful currents required, whereas in the Browne process current can be taken from the ordinary supply mains with the help of a simple transformer.

As ozonisation—that is, the impregnation of water with ozone mechanically—has been proved to be effective in sterilising and purifying water, it might be supposed that Mr. Browne's electric currents act in a similar way by transforming the oxygen suspended in all ordinary water into ozone, but we gather that he rather favours the theory of a development of radio-activity in electrified water. The operation of purifying water by the Browne process has, on the other hand, an apparent physical similarity to some of the chemical processes, as in each case coagulation of suspended impurities occurs, and this is removed by filtration.

We understand that Mr. Browne is consulting Mme. Curie on the point of the presence of increased radio-activity in electrified water, as he is of opinion that this is one result of his process. Radio-activity, of which our scientific knowledge is only on the threshold, probably exists in all substances, and it has been found to be present to a greater extent in some natural waters than in others. Should the theory prove to be correct that the passage of electric currents through water endues this latter with considerable radio-activity, we are then face to face with the question whether this quality is, as it may be, of high medicinal value, or whether, like X-rays, it possesses potentialities for mischief as well as curative properties. Coming back again to milk, Mr. Browne already knows that the beneficial action which he claims can be rendered destructive by the use of currents of too high a power, that electrolysis rather than oxidation or ozonisation takes place, and we might therefore suspect that so great a radio-activity might be induced in water as to be injurious.

There are accordingly, it seems to us, possible potentialities in Mr. Browne's process that require careful investigation before it can be considered, as they say in the States, fool-proof, but we think it must be admitted that he has already shown that the process will purify water and sewage. The cost of this is another matter as to which definite figures are required. At present it appears that only a small amount of electricity of low power is necessary, that it is easily and readily applied, and that therefore it should ordinarily be cheaper than other processes already in use, whilst it certainly possesses the advantage of ready applicability.

NOTES AND COMMENTS.

The Manchester City Council has continued its ill-treatment of the architectural profession by deferring till December the consideration of the motion for the adoption of the report of the Special Committee on the successful competition plans for the new Art Gallery and Library. The Lord Mayor stated that no great hardship would be caused if the matter were postponed till the December meeting of the Council. Of course not, architects never feel it a hardship to wait for payment of money they have fully earned.

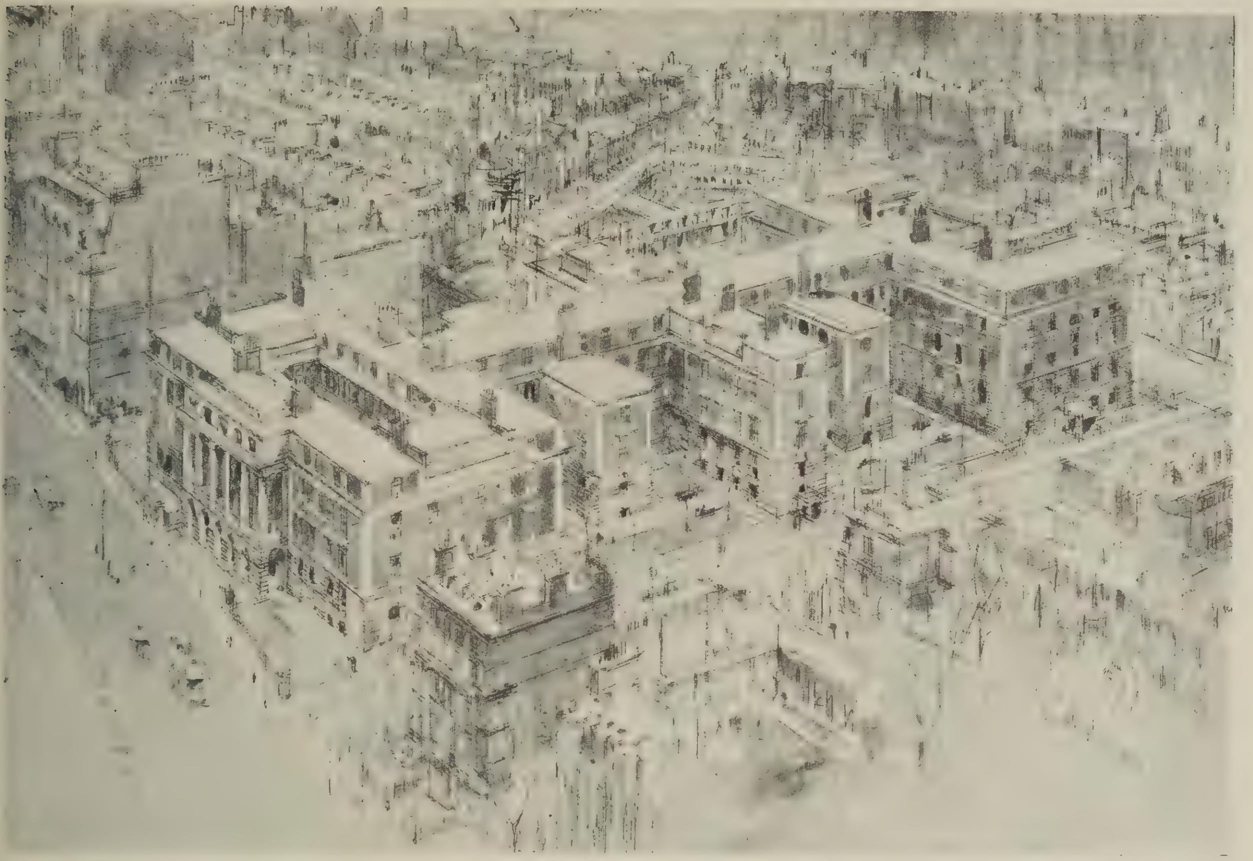
It seems that Manchester will finally decide what it is going to do, and do it a day or two after the Greek Kalends. It has bought the old Infirmary site cheap on the understanding that it should be used for a specific purpose, the erection of an Art Gallery and Library; but some of the citizens want to keep the site as an open space, others as a location for a new Exchange, and the advocates of each of the three schemes are all agreed on one point, that the partisans of any two should block the way for the third.

Mr. Raymond Unwin is educating the people of Birmingham in his lectures on town planning at their University in a manner that is causing them some astonishment as well as interest. In his latest lesson he said that it has sometimes been suggested that if we lessen the number of houses to the acre to about ten we shall spread towns indefinitely and seriously increase the distance from the centre. But he demonstrated, in opposition to this theory, that if the present area of Greater London was town-planned on the basis of Bournville or the Hampstead garden suburb, where there are not more than ten houses to any one acre of land, it would accommodate more than 12,000,000 people instead of its present 8,000,000. The overcrowding of houses in London and other large towns is not general, but local. In the most densely populated district in London—Southwark—there are 186 people to the acre, but the average of the whole of inner London (London County Council area) is sixty-four people per acre, while the City of London has only twenty-eight people to the acre. Two reasons were given why the increase of the diameter of a town will be unexpectedly small, even if overcrowding is absolutely done away with, provided it is properly arranged. The first is that the area increases in the ratio of the square of the diameter—the distance from the centre required to double the population is a constantly diminishing one; the second that careful planning will do away with the waste of land resulting from lack of adequate means of communication. In illustration he applies his figures to towns smaller than London: a circle, the radius of which is one and three-quarter miles, would accommodate 160,000 people, with not more than fifty people to each acre; but if we double this population we need add only three quarter miles to the radius of our circle, making it two and a half miles, to accommodate them.

We are glad to see a letter in *The Times* from Mr. Norman Shaw and Mr. Basil Champneys protesting against the proposed destruction of the present chapel of Balliol College merely because someone who can afford to pay for a new one does not like Butterfield's work. As the writers truly say, "By this wanton act of destruction Oxford will lose a valuable specimen of the art of the nineteenth century, the work of the greatest genius of the Victorian age. Whatever can be said against Butterfield, most architects agree in praising the dignity and originality of his work."

The Highways Committee of the Cumberland County Council seem to be inclined to persist in their vandalistic destruction of old Portinscale bridge, having adopted the view of their sub-committee and recommended that a new bridge be built at the cost of some £4,000, instead of repairing by grouting the old one for £800. We hope the County Council will accept the offer of Canon Rawnsley and Mrs. Slack, of Derwent Hill (the property nearest to the bridge), to guarantee the cost of grouting the bridge if the result is not satisfactory. Thus the Council have the opportunity of possibly saving the ratepayers £3,000 without risk, but with the advantage of maintaining one of the beautiful things of Cumberland.

Smoke abatement does not meet with the approva of Professor Arnold. In addressing a meeting of the Sheffield Electro-Metallurgical Society he asserted tha smoke was vitally necessary to the production of steel and particularly to that of the finest quality. "If yo start to tamper with the manufacture of this steel," h said, "by putting on restriction after restriction and, above all, if you try to limit the smoke our quality will be gone, absolutely and surely and I ask those who in a genuine way wan to reduce the smoke, to think what the communit is: It is a steel-making community. As in actual warfare you have to take some risks, so in industrial warfare and particularly in this metallurgical warfare, and so i does not do to take these Utopian ideas about smoke. I smoke is necessary for the industry, it must be endured or that industry must go. I am perfectly certain," h continued, "if there is anything like a crusade to sto smoke from metallurgical furnaces unreasonably manufacturers will not make their extensions in Sheffield, bu elsewhere, and so much money will be lost to this particular community." They must be careful not to kill th goose that laid the golden egg. But whilst thus championing the production of smoke in steel-making, h admitted the lack of necessity for smoke from boiler furnaces and household fires, and urged that it was th furnaces and the household fires pouring out their gase which were really injurious to health, of which the anti-smoke people took no notice whatever. One of thes gases was carbon dioxide, one of the most deadly o poisonous gases, and another was sulphur dioxide, whicl affected the throat very much. These gases were invisible and though very injurious were contemptuously ignore by the smoke inspectors; yet they probably injured th health of the community far more than the particles o carbon upon which their eyes were so thrown in thei inspections.



SUGGESTION FOR REBUILDING ST. GEORGE'S HOSPITAL.—By Mr. Mark H. Judge.

HYDE PARK CORNER AND ST. GEORGE'S HOSPITAL.

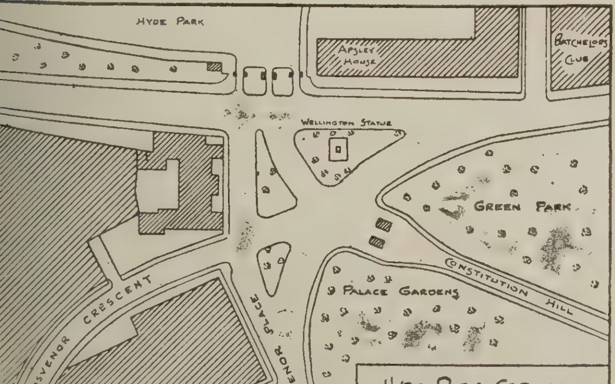
By Mark H. Judge.

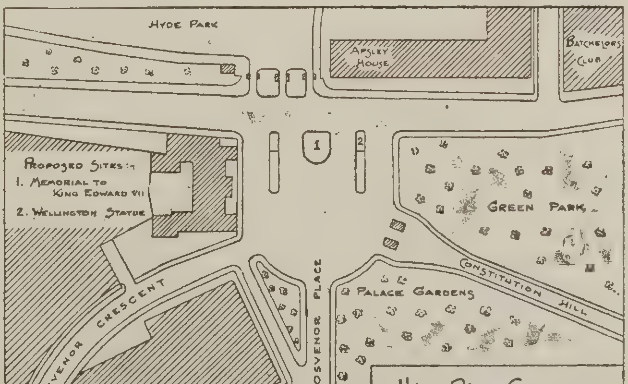
THE favourable reception given to my proposal to remove St. George's Hospital from its present exremely valuable, but, for the purposes of a hospital, nost unsuitable site, to some quieter spot in near proxinity to Hyde Park Corner has led me to give further onsideration to the proposal. The open spaces at Hyde Park Corner, the Strand, and Piccadilly Circus are erhaps the worst examples of bad planning we have n the Metropolis. No place in London is more capable f successful treatment than Hyde Park Corner, with Decimus Burton's noble entrances to the two parks, he Wellington statue, Apsley House and other dignified uildings adjoining. How chaotic the present planning s and what might be made of it by a bold and dignified cheme is shown in the two accompanying diagram plans, 1) as at present, and (2) as designed by Professor S. D. dshead in connection with his proposal for the King Edward Memorial. Whether the memorial will be placed on this site or not, all must hope that some such ordered design as Professor Adshead's may be adopted for this important open space.

The realisation of so great an improvement would not be complete without the removal of St. George's Hospital and the erection of some great public building in its place.

St. George's Hospital was instituted in 1733 in what was then Lanesborough House. The present building was erected in 1827-1834 and added to in 1879. It is one of the largest institutions in the Metropolis, and the total number of beds available in 1910 was 334, in which year there were 4,844 patients admitted, 679 being children under twelve years of age. The number of new out-patients seen last year was 48,583. Attached to the hospital is an important Medical School, with laboratories and museum, where an immense amount of pathological and bacteriological work has been carried out, and the school has thus afforded medical students a first-class training.

The hospital as now situated, surrounded by noisy thoroughfares, is certainly out of place. Piccadilly is





the main west London road, and all day, and all night, a constant stream of traffic is passing, as also on the route to Victoria Station, while motor omnibuses have their stopping-places alongside the very hospital doors. It is doubtless very desirable for a hospital such as this to be situated near the great parks, but the advantages thus gained must be greatly nullified by the noise and dust of a great London thoroughfare like Piccadilly. Last year 1,671 cases of major operation and 131 cases of minor operation were performed in the hospital, while in the out-patients' department there were 1,244 cases of operation. Such cases should be treated away from dust and noise. Here both the suffering patients and the hard-worked nurses must find the noise of the constant traffic very trying.

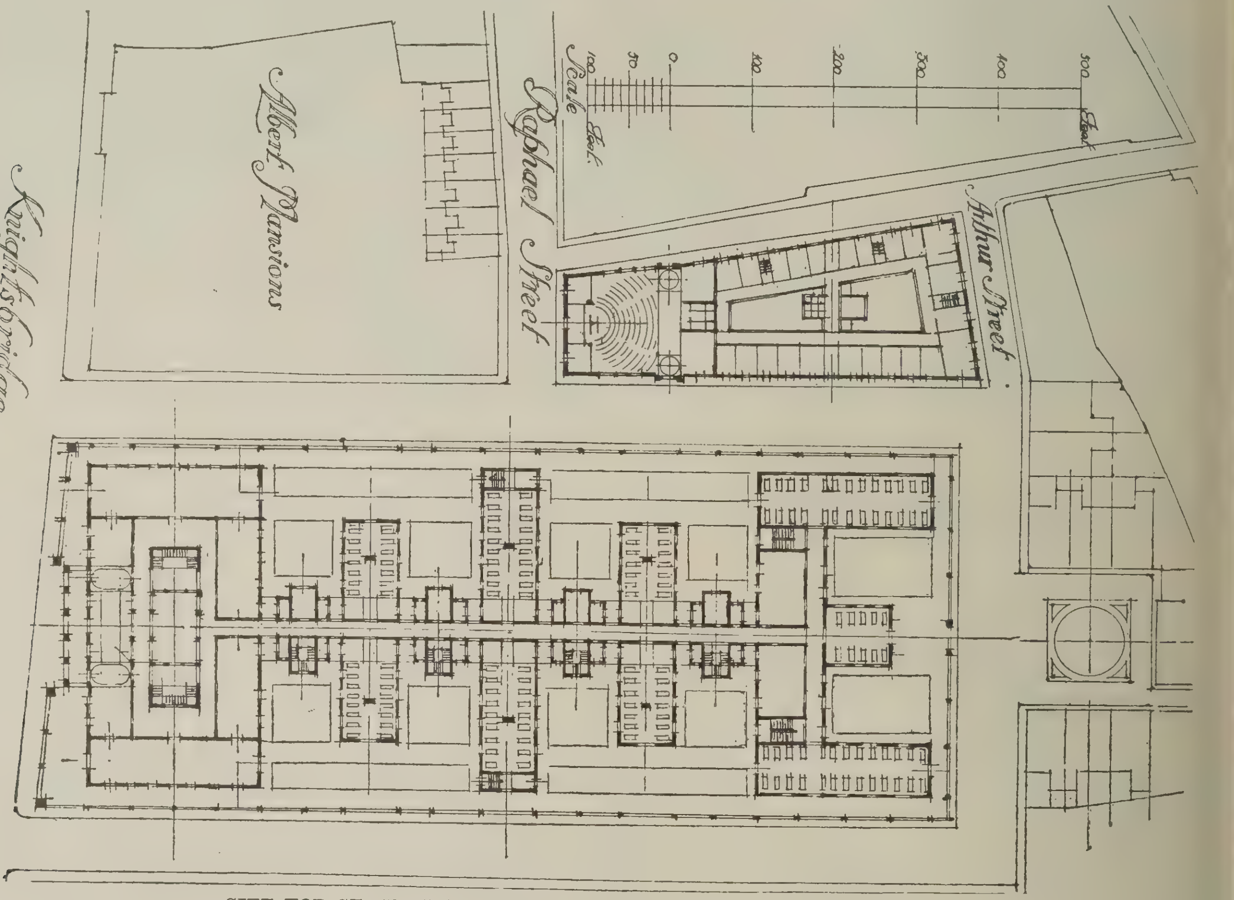
As evidence that the hospital is not well placed I may quote the following from Sir Henry Burdett's work on Hospitals: "St. George's Hospital occupies one of the finest public sites in London. It is believed, however, that the finances of the institution suffer from this circumstance, because many wealthy people who so frequently pass it during the season, instead of being attracted to its support, console themselves with the reflection that a hospital so well placed, and so constantly before the public eye, must necessarily have more money than it knows what to do with. We mention this fact as a gentle hint to those immediately concerned, and by way of consolation to the managers of other hospitals, situated in poor neighbourhoods which are seldom or never seen by the wealthy."

That the hospital should be removed from its present situation must be almost the universal opinion, but the difficulty has been to find a suitable site within the radius the hospital now serves. An appropriate site now offers itself on the Trevor Estate, on which not only are the old buildings to make way for new ones, but new road planning is proposed. Trevor Square is in such close proximity to Hyde Park Corner that it is almost an ideal site for the district hospital, easy of access and yet sufficiently away from the busy thoroughfares to give that quiet which is so desirable for an institution of the kind.

The accompanying plan and perspective drawing are not put forward as proposals to be carried out either as regards arrangement or elevation, but they will give some indication of what might be done with the site. The administrative block would be next the Knightsbridge Road, and every other part of the building would be surrounded by quiet roads with no through traffic, while the gardens would afford the much needed opportunity for open-air exercise and treatment.

The accommodation of the present hospital is, on the ground floor, 7 wards with 89 beds; on the first floor, 11 wards with 135 beds; on the second and third floors, 127 beds, making a total of 351 beds.

The accompanying ground floor plan of the proposed hospital at Trevor Square shows 9 wards with 146 beds, so that with only three floors a total of 438 beds could be provided. The perspective shows three floors above the ground floor, and a lower ground floor in the Brompton Road half of the building.



SITE FOR ST. GEORGE'S HOSPITAL.—Suggested by Mr. MARK H. JUDGE.

The total area of the site of the present hospital is 67,192 square feet, and that of the proposed new hospital building is 126,000 square feet, including the gardens shown. Parts of the estate not required for the hospital building might with great advantage be devoted to a Medical School, Nurses' Home, Residence for Doctors, and other appurtenances necessary to a well-equipped institution. The site therefore affords a splendid opportunity for a comprehensive scheme, with detached buildings for those departments which are better distinct from the building in which patients are received. The situation being so desirable, the institution might well have wards for paying patients.

The scheme is, of course, only suggestive of what might be done. If something like what is proposed is feasible, it would seem that a case has been made out which is worthy of consideration by the authorities of the hospital before the land is acquired for other purposes, which before long must be the case, seeing that building sites in so central a position cannot remain in the market for any lengthened period.

The Knightsbridge Road is now practically a continuation of Piccadilly, with Hyde Park instead of the Green Park as one of its boundaries. Property in the whole district has developed at a great rate during the last few years: this development will be even greater in the near future, and it will become more and more difficult to get land for building within a mile of Hyde Park Corner, except at a price which would be prohibitive for such an institution as St. George's Hospital. Such an opportunity as is afforded by the falling in of the leases on the Trevor Estate is one that cannot occur again, and in the interests alike of a great charity, and of a great public improvement, advantage should be taken of the opportunity before it has passed away.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Concluded from last week.)

AFTER luncheon the members reassembled in the Jerusalem Chamber. The first contribution was a short paper by Professor W. R. Lethaby, F.S.A., on

The Confessor's Shrine.

The shrine, he said, consisted of a gable-roofed coffin covered with plates, arcades, and figures, all of gold set with precious stones. Similar shrines of about the same date are at Tournai and Rouen. Mathew Paris records, under the year 1241, that Henry III. caused a shrine of pure gold and precious stones to be made. Probably it was begun at this time; but it was not completed for full thirty years. When it was begun the King's favourite man of affairs was Odo the goldsmith, and his son Edward continued in his place. Two documents regarding Odo are among the muniments of the Abbey. One shows that in 1241 he lived in a big way at Westminster, and received a grant of a free chantry in his private chapel. The other shows that at one time he was Provost of Westminster. Edward, the son, called "of Westminster," is also named Goldsmith in another of the documents. As we learn from other sources that he was keeper of the shrine from the time of its commencement, we may consider it certain that the shrine was the work of the goldsmiths Odo and Edward of Westminster. In the Cambridge "Life of the Confessor" there are pictures representing scenes at the Confessor's shrine. Whether it represents Henry III.'s new work is not quite certain.

The marble and mosaic basement, of Italian Cosmati work, on which the golden coffin rested still remains. It is one of a number of examples of the art of the Roman mosaic worker in the church, and which form a group which has no competitor this side of the Alps, and must be one of the most remarkable in the world. An inscription on the Presbytery pavement shows that it was laid down in 1268 by Odericus, from Rome. A similar inscription on the shrine basement records that it was the work of Peter, citizen of Rome, in 1279. Now it was long on record that the tomb of Pope Clement IV., at Viterbo (died 1268), was the work of Petrus Odericus An inscription to that effect was noted by a writer in 1685. A local guide to Viterbo published in 1894 states that the Pope's tomb was by the same artist who xecuted the tombs of the kings in the famous Abbey of Westminster. This view, which has been adopted by later authorities, seems in the main a correct one. The facts would appear to be that Oderic and his sons were the most famous mosaic workers in Rome, and that Henry III. attracted the father to Westminster. The Pope died in the year when the Presbytery pavement was finished by Oderic. His son, Pietro Oderisi, made the papal tomb; possibly he ad been with his father and was called back to Rome. Later, when the Pope's tomb was done, Peter came to Westminster o execute the basement of the Confessor's shrine, which was inished in 1279.

Mr. Frotheringham, in his "Monuments of Christian Rome," gives this account of the author of Clement IV.'s tomb:—"A leader of the Roman school, Peter, son of Oderi- us, made the first attempt to introduce both sculpture and mosaic decoration in sepulchral art in his tomb of Clement IV., at Viterbo, in 1268. If there were any earlier xamples of this type they have perished. He also for the rst time substituted for the antique architrave and classical rders the Gothic trefoil arch and foliated capitals. It was uite a revolution." The Westminster shrine basement has trefoil arches, and the inquiry suggests itself: Did the revolution in the Roman marble-workers' style originate in consequence of their contact with Westminster? A close comparison between the shrine base at Westminster and photographs of the tomb at Viterbo shows sufficient resemblance to justify one saying that they are by the same hand. One of the arched compartments at Westminster is filled in a singular way by circles at top and bottom connected by vertical strips; the same awkward arch-filling is found at Viterbo. Then, again, we find one of the columns inlaid with an inverted chevron pattern of large scale; the same pattern appears on the soffite of one of the niche-heads at Westminster. On the tomb of Henry III., which was certainly wrought by the same master who did the shrine-base, there are large crosses on a plain field in the two recesses; there are similar crosses at the end of the Pope's tomb. It may, in fact, be accepted as proved that the shrine-base and Henry III.'s tomb are the work of Peter, son of Oderic, who made the tomb of Clement IV. at Viterbo and another tomb in the same church.

A fragment of the architrave of the basement exists which can only have found a place at the west end, over the shrine altar; it evidently projected about six or seven inches at each end of the west front. On comparing the record of the whole of the inscription with that now apparent on the east front it is found that space for five or six letters was required at the west end beyond the number at the east. Such projections would give that space. These projections must have been carried by special columns, which also shielded the base ends of the reredos slab. Four years ago there was found among the fragments stacked in the triforium two pieces of little plain spiral columns of Purbeck marble with a line of gilding up the recesses of the spiral. Apparently these were the marble columns placed round the shrine in the same manner as the twisted columns of similar size and shape round the shrine of St. Albans. These must have been fragments of three marble columns placed at the Confessor's tomb—apparently to support lights—in 1289, at a cost of 46*s.* 8*d.*

Mr. H. St. John Hope remarked that Professor Lethaby had made good his points in every particular. The paper was intensely interesting, because it was always instructive to know who had made the wonderful early works. Furthermore, the paper showed that although such a tremendous lot had been written about Westminster Abbey, there is still a mighty lot to find out by means of patience and the comparative method. Each generation ought to contribute the quota, and they might be sure that Professor Lethaby, himself, and others would do their best.

Sir Henry Howorth said it was exceedingly interesting to find the twisted columns at the Confessor's shrine so soon after they had been introduced into Rome. In one of the churches at Naples there were to be seen pieces of furniture with gilding in the recesses; but the date was very much later. At Westminster there was a splendid example of mosaic pavement. When he was last at St. Mark's, Venice, the old man who was engaged on restoration of the pavement there had told him of the great difficulty in getting glass cubes to match the old work, and that he was using cubes from pieces that had been broken up. He thought it consoling to know how careful they were in Italy now in these matters.

The second contribution came from Mr. Edward S. Prior, F.S.A., F.R.I.B.A., who took for the subject of his remarks

The London Style.

The mediæval monuments of the Abbey, he said, had certain characteristics and methods of sculpture which he had called Westminster Style. But the King's masons and craftsmen engaged on the Abbey appear to have had their shops in the City, and many of them were described in the records as citizens of London. The proposition he wanted to lay down was that London in the Middle Ages was the mart of English art, and that at the background of all provincial styles there was the style of London, its workmanship, and its art.

London influence on style was not exercised till after the twelfth century. It became strong in Henry III.'s reign—particularly with regard to sculpture. In effect this was the spread of a shop style over architectural or builders' styles. The London method of doing things made sculpture a shop speciality, and the reasons for its dissemination were obvious. The political position of London as the usual residence of the Sovereign and the place where Parliament met was one. Mediæval art was peculiarly ecclesiastical, and concerned most largely with the building of churches and with the monuments put into them. The bishops and other clerics at the head of affairs had to come constantly to London; they knew London style and ordered their monuments there, and the works were sent away to the various cathedrals and abbey churches. But London, too, would be more directly in connection with Continental art, for in the metropolis lived the nobles and heads of estates who had affairs abroad, and consequently fell under the fashions and influences of the Continent.

And there were peculiar conditions, in that London lies in a basin of clay; consequently she never possessed a sculpture craft exercised in the working of local stone. It was not as was the case with Durham, Wells, Exeter, or Lichfield. London had to introduce its stones in order to build. Much came from Reigate, Caen, and the north countries. We have evidence in Westminster Abbey itself of the employment of a great number of stones, particularly the use of mixed materials in the monuments. The beds of Reigate stone were not high enough for the purpose of effigy-making. For the monuments made in London, blocks of marble, alabaster, and clunch were specially imported; also wood and bronze were used. The London producer of sculpture, in fact, exercised himself in all varieties of material.

Since London had no masons of its own, because it had no quarries, its stoneworkers came from the outside. There are in the Abbey accounts constant references to masons from the country. At the end of the thirteenth century they seem to have been drawn chiefly from the county of Kent; eighty years later there was a run on Gloucester masons. But what happened in these cases was that directly the mason came into London he got in touch with workshop art, and developed in quite a different way from what he would have done had he remained in his native place. And when he returned there afterwards he took back with him the London style. And so it was spread broadcast. Also, from the works of the London shops around the country, provincial masons took up their ideas of art.

The first London production of monumental effigies developed the Purbeck marble style. The use came in the ordinary practice of building from Purbeck itself. But the early figures seen at Peterborough owe their distinction to the fact that London was developing this workshop art. There came a time when it was realised in London that it was just as easy to import and carve Caen stone for figures as Purbeck marble. Immediately we find these stone figures forming the basis of the English style all over England. The stone was capable of being carved in much more lively fashion than the Purbeck marble had been. Accordingly we have lively figures of knights drawing their swords, worked in the local stones in imitation of the London production. Besides these two materials there were others. Effigies of wood, with a surface of gesso and engraved brasses, were particularly London methods of memorials, and were the basis of local imitations.

The monuments in the sanctuary of the Abbey were peculiarly Westminster monuments, and they were not only copied elsewhere, but served as the foundation of the English style. One marked feature in the figures of these tombs was the new habit in the treatment of the drapery, the old architectural way passing into the natural way. The tomb of Aveline, Countess of Lancaster, in the sanctuary, shows a distinct step forward. The canopies and gables of these tombs are to be seen in a great many places in England. There can be little or no doubt that it was at Westminster they were first evolved. Again, the attitude of the effigies on the tombs of Crouchback and de Valence are new departures. The Westminster carvers represented their knights lying in a more or less negligent way, and with their hands clasped in prayer instead of drawing a sword. This Westminster method shortly grew to be a universal habit in this country. Abroad the knight had always been sculptured with folded hands. Again, the Westminster use of alabaster begins the use of that material in English monuments. The alabaster figure of John of Eltham (died in 1337) is, in its sculpture, from the same hand as that of Edward II. at Gloucester. In both cases these monuments are composed of the three materials so typical of the Westminster style—viz., alabaster, marble, and Caen stone. But the effigy of John of Eltham is just like the stone figures to be found at Rochester and elsewhere close to London which we must suppose were carved in London. It is the same with the earliest alabaster effigies of bishops; they were evidently carved in London. Then, the making of the London monuments became the model for the local productions, all of alabaster, at Chellaston and Nottingham. In the same way, later, the carvers of Henry VII.'s Chapel have left another work of theirs, or a close copy of their style, in the great tomb at Paignton, in Devon. Illustrations of the close connection of English sculpture with London models might be multiplied indefinitely.

The meeting terminated with a cordial vote of thanks being passed on the motion of Sir Henry Howorth to Mr. G. D. Hardinge-Tyler, the secretary, for all the trouble he had taken in the arrangements.

ENGLISH MEDIÆVAL ARCHITECTURE.—III.

MR. PRIOR in his previous lecture having dealt with the 450 years of uncreative Saxon style which preceded the Conquest, in his third lecture treated of the half century immediately subsequent to that event. This he considered one of the most astonishing periods of creative style which the world has seen, for in some fifty years all the principles of Gothic architecture were established. The Norman absorption of Britain meant the coming from Normandy of the "great church" in contradistinction to the preceding "small church." The chief character of this abbey church plan was to be seen in its development from the Roman or aisled basilicas, by its expanding eastward into a great hall whose centre was lighted by a lofty lantern—developed from the ambitions of the domed basilicas of Byzantium. In England its importation immediately aroused a specially creative experiment. The Benedictine ascendency ruled church building here for many years, and the architecture of the great Anglo-Norman Romanesque ought indeed to be called "Benedictine" rather than English. The Conqueror set the Benedictine houses as garrisons in a conquered country, the established masters of all around, and the power and wealth of the monks was expressed in the building of great abbey churches. For three centuries the "great church" plan of the abbey ruled the creation of English style. As compared with the "cathedral" plan of the Continent this English type may be called "monastic." The largest of our cathedrals were Benedictine churches as well as bishops' seats. Abroad, on the other hand, the cathedral appears as a rival to the monastic church. So the Benedictines set a model of magnificence, the memory of which had a constant effect on the ideal of the English great church.

Durham keeps better than other cathedrals its Anglo-Norman effect, with the most essential features of the English development. The first peculiarity of English churches lies in the great length of the church body and in the large number of bays by which the basilica prototype was extended. The great projection of the English transepts is another peculiarity, likewise the development of the imposing western façade with a broad hall—though this latter is traceable to Saxon habit. The English lantern tower was carried up with a characteristic and unique squareness, bulk, and height above the crossing. A final development lay in the eastward extension of English plans according to two types—viz. that of the "parallel apses" and the peri-apsidal. The first was that of the single high apse at the end of the choir, this apse being set against a square-gabled ending, the wings of which externally masked the apses of two parallel aisles. In the peri-apsidal ending the aisles instead of being stopped by apses are carried round the circle of the high apse, making a passage from which generally three apsidal chapels project tangentially. This type is stated to have been first used in St. Martin's, Tours, built c. 1000, and is thought to have been devised to afford a separate and convenient passage for pilgrims round the shrine of St. Martin which was placed on the apse floor. The best English remaining example is Norwich. The use of both these plans in English churches took them out of the Saxon stage.

The foreign plans of "great churches" have, as well as main apses, the transepts with apsidal chapels, sometimes to the north and south, but generally projecting to the east. These apses in the transept were common in some of the early English examples; but in others, as early as at Durham, the transept chapels are ended square to the east and take, in fact, the form of an aisle. Not only chapels but the whole ending of the English cathedral tended to be square, as at Winchester and probably at Chichester. Another point in the planning of the great monastic church as Anglo-Norman building received it was that whereas Saxon churches were aisled simply on one floor, the new church had a triforium passage which the Benedictines carried round the transept ends and also round the apse at the east end, so that it was continuous for the whole length of the church. In Anglo-Norman architecture, except in one group of the great abbey churches of Western England, this continuous second storey was a well-developed feature, and lasted as a long tradition. Its arched openings into the central nave made the bay take its three divisions. These three storeys were the distinguishing order of monastic architecture, and their presence in English style shows the mark set by the Benedictine architecture of the great Norman abbey.

The ecclesiastical dictation of the Conqueror's dominating prelates lay in the vast ground plan; the magnificence and order of the Benedictine rule gave the scheme its impressive massiveness. Next the builders took up the story and made

Anglo-Norman style out of the expediency of their crafts by a series of revolutions. The first post-Conquest building imported both workmen and style. But in the subsequent vast enterprises the English population was pressed into service. Later came the third Anglo-Norman stage, when the growing skill of the workman transformed the new character introduced by his predecessors by making the mason a free agent in construction.

The great fortresses of the Normans generally ante-dated their abbey buildings in England and influenced them. But the constructive methods of the two were not essentially different. The "ingeniator," or military engineer, was also a mason equally skilled in the building of castles, churches, and bridges. In the halls or chapels at Durham Castle and the Tower of London we see the unalloyed work of Norman masons. Their feudal lords wanted strongholds at once, and so brought over the actual masons or engineers who were building in Normandy.

But the magnitude of the ecclesiastical erections c. 1100 needed an army of builders. Not only were the plans vast in their setting out, but the masses were hugely constructed. The rubble core was faced with squared coarse ashlar left rough from the pick and the axe with thick mortar joints. The surface was overlaid by a thin plaster, and on this internally came a painting of figure-subjects which were set in great panels of broad colour with borders of Byzantine and Carlovingian decoration. For the outside face, it is believed, a stucco was usually applied and all the walls were whitewashed. The figure decoration was not necessarily a Norman importation, for in the great Saxon monasteries the productions of the native school of manuscript painting take the first place among the arts of West Europe. Accordingly the broad flat surfaces of Anglo-Norman style, though now naked, rough, and formless, were in their day likely to have displayed the most finished painting art of Europe.

English construction, however, did not long continue unskilful. Native slave labour ceased in the times immediately following the Conquest. Continually building in the service of the monasteries the Englishmen often became lay brethren, if not admitted monks, and shared in the same religious aspirations. At Norwich and Durham c. 1100 the considerable bodies of masons were skilled in stone-dressing and had acquired the secrets of stone-construction. No restrictions of chisel-work appear—on the contrary the surfaces of elaborate dressing begin to multiply. Moreover, the theory of construction took enormous strides, and there began that course of constructive experiment which was to continue throughout the whole English mediæval period. It was to fine away almost to nothing the mass of walling, transforming the whole function of material, replacing the concreted amalgam of Roman style by the Gothic webs of fitted fibrous cohesion that followed on the advance of the mason in chisel-work.

The prominent necessity of mediæval building that had most to do in producing this wonderful transformation was the vault. In the Anglo-Norman abbey and cathedral churches the builders may be credited with the intention of vaulting them, though the expression of vaulting lay more in the faith of the religious founders than in the knowledge of the building mechanic. But in the building of Durham choir in 1093 vague aspirations were replaced by definite ideas, and the builders who carried it out about 1104 were among the earliest in Europe to work out and achieve that system of ribbed vaults with intersecting ribs which is taken as the mainspring of Gothic construction. Here they discovered how a stone roof could be lighted at the side. Their new method did more than provide a window-lighted stone-ceiled hall, it established a principle of building which consists in the concentration of thrusts. So that, instead of the solid ceiling resting uniformly on the body of the wall, as in Roman groins, dome construction and barrel vaulting, the pressures and stresses were directed on a point where it could be met by an abutting or flying arch to a point outside the area of the building. Thus the interior of the building was relieved of the necessity of encumbering its area and providing continuous support to its ceiling, that support being arranged outside. Now this was making a new principle in building; it was giving masonry a coherent and artistic fibre in place of its being an inert conglomerate.

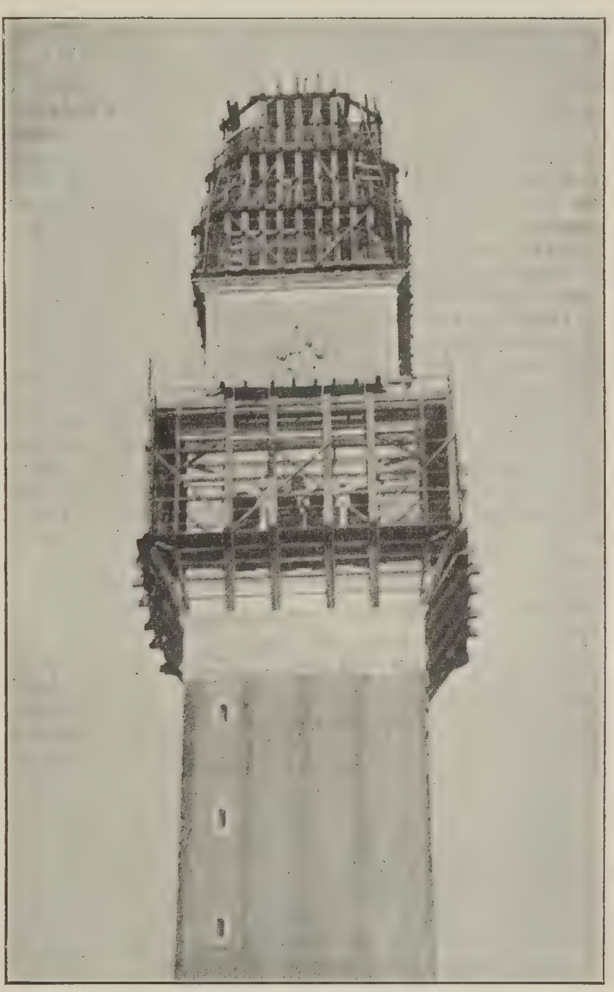
The carriage of large stone was a great difficulty in mediæval building. It was therefore impossible to make the arch or jamb in a Norman wall, say 10 feet thick, of a single stone. The Romanesque arches were contrived for the use of stones of small scantling (say a foot wide and high) by the expedient of building a series of inner arches. Any number of rings could be put, and so any thickness of wall compassed with the use of little material. This recessed construction of arches was a method pregnant all through mediæval architecture, shaping doors, windows and arcades in a constant succession of forms.

ST. MARK'S TOWER, VENICE.

By Robert Williams, F.R.I.B.A.

Some nine years ago I journeyed from Egypt on my way home to view the ruins of the noble tower of St. Mark's. Only the stump from 10 to 12 feet high, surrounded with the débris of mortar and broken brick and stone, remained. The authorities had put a strong close-boarded hoarding around all. Inside, the workmen were carefully gathering together and sorting out the moulded stonework and unbroken bricks. The broken marble work and sculptured panels of Sansovino's beautiful loggia had been already reverently collected and carried into a court of the ducal palace just across the square.

Can anyone feel real sorrow on viewing the destruction of a work—a work by human hands? One may think so. The great square, with its mighty watch-tower at the corner nearest the sea, seemed empty. The great new hoarding with signs of débris at its outer margin looked like the hedging in of the new grave of one even mightier than Cyclops—a proud sea-mark struck under, never to rise.



ST. MARK'S TOWER, VENICE.—OCTOBER 1911.

Thoughts of the spirit of Ruskin for the moment chased other thoughts away. It was one of his "noble towers." What would he say were he to see the great tower thus prostrate? He, Ruskin, had compared St. Mark's Tower in a special plate in the first volume of the "Stones of Venice" with a "British" tower, much to the discredit of the latter, although in a later work, "Modern Painters," Ruskin says in a note that the "college tower (Edinburgh, finished in 1850) is not kindly represented." He might have confessed, also, that it was hardly fair to compare a British tower 121 feet high with an Italian campanile some 350 feet high. But the lessons in towers in his chapter on "Superimposition" in the "Stones" are nevertheless good. "There must be no light-headedness in your noble tower," he writes; "impregnable foundation, wrathful crest, with vizor down, and the dark vigilance seen through the clefts of it; not the filigree crown or embroidered cap. No towers are so grand as the square-browed ones, with massy cornices and rent battlements." Thus generally on towers, and of St. Mark's specially, he wrote in his diary: "I think the campanile of St. Mark's is the most perfect instance of the power of proportion that can be given."

Thinking on these words, fair and true as they were, I turned away with a feeling of sadness. The lantern, with its emblematic figures of the Venetian Republic and of Justice; the bells, which had tolled warnings out to sea; the golden angel fitly crowning the steeple and the massive shaft, all—all of this goodly tower of noble proportions had fallen prostrate to the ground. The Queen of the Adriatic had lost her highest pinnacle; the book of the world's art had lost an invaluable page. What was to be done—nothing but go and sit among the heedless blue pigeons in the piazza and sip coffee!

Later I saw a manufacturer and dealer in those works of glass and mosaic for which Venice is still famous.

"What will the city do? Rebuild?"

"There's talk of it, but the money had far better be spent on other works more needed in the city."

Nevertheless it was wisely decided to rebuild. In due course new, wider and deeper foundations were begun, and in about two years I had the pleasure of viewing the foundations, then partly above ground, built in strong, massive, carefully dressed Istrian limestone, set on concrete packed on to deep-driven piles. A small nucleus of the old concrete was left in the centre. There was no hurry, no American hustling—the architects built with care and love. The base of the old tower had stood the test of a thousand years, and they desired, at least, a like period for the life of the new tower. So the work went on for years.

Again my sail set for fair Venice. It was dusk when I approached a week ago, and looming up before me as the gondolier plied his oar towards the mouth of the Grand Canal I could see the head of the splendid tower reared on high once more, enveloped in the bandages of a bracketted scaffold, the body having been stripped of scaffolding some time before. There was the tower, as before, only stronger and better and endowed with a new and longer lease of life. It was a glorious treat to be allowed to accompany the superintendent up the inclined way to the lantern balcony and to see as we ascended how lovingly and well the architects had done their rebuilding. And here I felt that Ruskin's words were, once more, true of the tower: "It is built as simply as it well can be to answer its purpose: no buttresses; no external features whatever. . . One bold square mass of brickwork, double walls, with an ascending inclined plane between them, with apertures as small as possible, and these only in necessary places, giving just the light required for ascending the stair or slope, not a ray more." An exact description of the new tower.

I might add that Sansovino's beautiful loggia, at the base of the tower, is also approaching completion. This, too, is as beautiful as ever.

All architects will, I am sure, be glad to know of the near completion of this fine tower, and I am sure they will rejoice with me that the architects and the local council with whom they worked have carried out their task with so much love, care, and artistic taste.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has issued two special numbers on hospitals, which contain valuable information on the most modern practice both in the United States and, for comparison, on the Continent of Europe.

Arkitektur og Dekorativ Kunst (Christiania) illustrates the monument to Rikard Nordraak, which is remarkable for the peculiar—we might almost say eccentric—character of the enclosing iron fencing. The exhibition buildings for 1914 are illustrated from photographs of a model. An illustrated article on English garden cities also appears.

Construction (Toronto) illustrates the new premises of the Standard Bank, Toronto, by Messrs. Darling & Pearson, and the Mason & Risch Company's new premises also in Toronto, a show house for the display of piano and other musical accessories. A bungalow in North Toronto, by Messrs. Curry & Sparling, is a curious but effective design carried out in boulder stones.

La Construction Moderne (Paris) illustrates a new church at Rouvres (Seine-et-Marne), a weird design by Mons. Julien Barbier, and a prize design by Mons. Camuzat in this year's Concours Chaudesaignes at the Académie des Beaux-Arts.

Deutsche Bauzeitung (Berlin) continues its illustrated descriptions of the new Stadthaus at Berlin, the new theatre at Freiburg in Breisgau, and the new prison at Mannheim. A scheme for the improvement of the central area of the city of Louvain, by Dr. Josef Stübben, is also described and illustrated.

Het Huis (Amsterdam) has an interesting illustrated article on Old Gouda, an account of the restoration of the church at Loon op Zand, and plans of the new Royal Sanatorium at Groesbeek.

Stone (New York) illustrates the Eighth Church of Christ Scientist, Chicago, the new wing of the Metropolitan Museum of Arts, New York, and the Geographical Society Building, New York. The collapsed concrete dam at Austin, Pa., is a fine object-lesson for our contemporary, and is supplemented by other telling examples.

Engineering Record (New York) gives a full description and views of the destruction of the Austin Dam, with an explanation of the probable causes of the catastrophe.

THE INSTITUTE OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have made the following awards in respect of papers published in Section II. of the proceedings for the session 1910-1911:—*Telford Premiums* to Messrs. S. M. Dixon, M.A., B.A.I. (Birmingham), H. J. F. Gourley, B.Eng. (London), J. Holden (London), A. Rogers (Horsell), A. E. Griffin (Hong Kong), F. C. Lea, D.Sc. (Birmingham); and a *Crampton Prize* to Professor W. E. Dalby, M.A., B.Sc. (London).

They have also awarded the *Indian Premium* for 1911 to C. E. Capito (Ahwaz, Persia), and the *Webb Prize* to F. W. Bach (London).

ILLUSTRATIONS.

"NATIVITY" WINDOW IN ST. ANN'S, MANCHESTER.

THIS window was designed by Mr. Arthur A. Orr, and was carried out by Mr. Rueben Bennett, Manchester. The subject is the Nativity of Our Lord: the Infant Jesus surrounded by adoring Shepherds.

WINDOWS DESIGNED BY MR. ARTHUR A. ORR.

THESE two windows were designed to the memory of a child. They represent "Christ blessing little children" and "The Good Shepherd." Angel figures representing "Gentleness," "Purity," &c., take the place of ornamental canopies. These designs were exhibited in this year's Academy by Mr. Arthur A. Orr.

STAPLEFIELD PLACE, SUSSEX.

THIS house, which has been completed this year for Mr. Henry Denny, occupies an elevated site adjoining one of the old Sussex commons, which is skirted by a former coach road from London to Brighton. As the garden and grounds were occupied by a mid-Victorian building, now removed, the new house stands among well-grown trees and matured lawns, and by the use of old Sussex tiles and stone the effect of newness is still further removed. The endeavour of the architects (Messrs. Clayton & Black, of Brighton) has been to reproduce the simplicity and quiet charm of the seventeenth-century manor house, of which so many examples may be found in the county. The builders (Messrs. Norman & Burt, of Burgess Hill) have well seconded their purpose. Among other contractors employed were Messrs. Henry Hope & Sons, for casements and glass; George Jennings, Ltd., for the sanitary fittings; and Phillip & Son, of Westminster, for heating appliances.

PREMIATED COMPETITION DESIGN FOR SCHOOLS, WALLSEND-ON-TYNE.

THE design we illustrate this week was submitted in competition by Mr. Edward Cratney, and was awarded the second premium.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held at Tufton Street, S.W., on Monday, ctober 30, Mr. Gerald Horsley, F.R.I.B.A., President, in he chair.

It was announced that the annual conversazione will take lace on November 23, at 8 P.M., and that the Athletic Club ance will be held in the Wharncliffe Rooms on December 8. r. E. N. Walker and Mr. R. C. Horsley were elected embers, and Mr. F. C. Eden was elected a member of the ouncil.

Mr. H. H. Hill, B.A., then read the following paper on

he Architectural Association Excursion to the Loire, 1911.

Mr. President and Gentlemen,—As there are many minds, are the points of view numerous from which the arts may studied and enjoyed. And I think in no art are people's leas of what is or is not to be admired so varied and so pricious as in our own art of architecture. To some a autiful building only means one very much enriched in its tails, exquisitely finished, and lavishly bedecked with rving and ornamentation. Others imagine that they have a eat taste for architecture, because they love to visit old ildings and try to conjure up visions of the personages and ppenings that history associates with their walls. In both ese classes professional architects are rare. There are some nong us, however, who have a curious knack of never regardg a building that is much more than a hundred years old real, living architecture. Rather, they treat it merely as example, more or less important, of architectural development, an illustration to the history book. And they are far ore concerned about the dates of its erection, the state and anner of its restoration, than they are about the æsthetic alities of its design. But this point of view is now oldshioned, and is only a belated and extreme phase of the eat and valuable movement towards the scientific study of chitectural history for which the last century is remarkle. For the majority of us nowadays I am sure I am right saying that our chief interest in all buildings alike, ether new or old, lies in their actual appearance, whether e result of time and alteration or of pure design.

Personally, I think it a good thing when one is looking at d work to consider it, for a while, at least, as design only; study how certain means have brought about certain effects, d the æsthetic value of these effects, detaching altogether r the moment the various historical circumstances that have d their share in determining the form of the architecture. course, from this point of view alone one could not make omplete study of any particular building. But we really e not often concerned in the making of such studies. We, modern designers of buildings, go out to see the work done our ancestors. We are not so much interested in our cestors as we are in their architecture.

So this evening, since time did not permit us completely study any of the buildings that we saw in the Loire Valley st August, nor will it now allow me fully to analyse them, want to do my best to describe to you the architectural pressions that I then received. These, I fear, being no re than the impressions of a first visit, will have little value serious criticism. I hope they will have this merit, at all ents—that they will evoke the expression of riper judgnts than my own.

The chief aim of the excursion this year was to visit the rly Renaissance châteaux, the work of the School of Tours, ich are so plentifully scattered about the Loire country, m Orleans downwards. There was also a considerable ount of interesting church work to be seen. Yet it seems me that in Touraine we were in a kind of ecclesiastical man's land. To the south of us was the great province Aquitaine, with its distinctive type of Romanesque rch. To the west was Anjou, where the development of lting made its own peculiar progress in the twelfth tury. And to the north-east lay the Ile de France, where rteenth-century Gothic shone with its greatest brilliancy.

In Touraine we were not in the rut of any particular e of work. The most important influence seems to have e from the south. And the further we travelled down river the more we seemed to encounter it, until finally reached Fontevrault, whose domes are hardly less epochking in the history of architecture than of Périgueux elf.

The Abbey of Fontevrault has had its vicissitudes. In 4 it was turned into a prison, and at that time the church s sadly mutilated. Three of the domes, I think, were taken down. Now restoration is in progress, and the almost Classic magnificence of the nave can again be seen. The east end is differently designed. There are no piers, pendentives, or domes. Closely-spaced columns of unusually long proportions are used, and their rising lines, crowned by small arches, have a very vigorous effect. Our only view was the outside of the gateway, an interesting piece of work of the eighteenth century.

The next most important church of the domical type, but a variant of it that is unique, was that within the castle precincts at Loches. Begun in the tenth century, the first bay at the west end of the nave is all that remains of the earliest portion. This is barrel-vaulted, and carries a tower and spire added in the twelfth century. The next two bays carry extremely curious pyramids, octagonal on plan. The internal effect of these is most weird and mysterious. Viollet-le-Duc was enraptured with the romanticism of the whole church. We saw it under the best of conditions, when the brilliant August sun sent the light right up to the apices of the domes. But in dark weather I should think the building must appear to be vaulted in inscrutable darkness, gloomy, and terrifying to an extreme degree.

At Blois the most interesting church is that of St. Nicholas, of which the nave is Early Gothic and the choir twelfth century. Here the influence of Aquitaine and its domes is very slight. There is an attempt at one over the crossing, but evidently the plan was changed, and eight ribs, carrying a vault, spring from the rim of the pendentives, upon which also stands a blind arcade, as though there had been an idea when changing the plan of converting the dome into a lantern. The capitals of the choir are also interesting, and are full of Classic feeling.

Of quite another type is the church at Candes. This dates from the end of the twelfth century to the fourteenth century, and is one of the "hall" type, with the aisles rising to the same height as the nave. The exterior did not strike me as possessing much interest, except for the porch, but the interior is extremely fine and full of dignity. The piers are clustered, rise to a considerable height, and are very well proportioned. The lighting is principally from long lancet lights in the aisle walls, treated in quite a simple manner, but greatly assisting the sense of height in the building.

Among other churches seen on the excursion was a fine Romanesque tower and apse at Langeais, the latter built in the ninth century. The spire was added in the fifteenth century, and the remainder of the church, which is absurdly ugly, within the last forty years. In the parish church at Fontevrault, Angevin influence in the vaulting is strongly marked. There is also a square east end, yet vaulted as though an apse had been intended. Blois Cathedral is a seventeenth-century attempt at Gothic, and, naturally, is rather dull, except for the tower, where the architect returned to his own Renaissance. Tours Cathedral I will not attempt to describe. I barely saw it, and I would very much like to see it again, for there can be no doubt about the magnificence of the west front.

To turn now to the châteaux that we visited—to what, I take it, was the real objective of the excursion—we find that in this class of building there was much more architectural unity than in the churches. One could see also in them the continuous development of the habits and conditions of life through several centuries, and along with it the evolution of the architectural sense. In the beginning the fortress château, built for defence, often rose to the dignity of architecture, because, if not "proportioned unto the rules," it was, at all events, "solid, masculine, and unaffected."

At a later period, when defence ceased to be the first consideration, and architectural magnificence was eagerly sought, the elusive fairy sometimes all but escaped, leaving in her room but a heap of carvers' pranks. Here certainly architecture was "unaffected," and in good work there was evidence of an endeavour to understand the "rules," though it did not always look solid, and often was anything but "masculine." Finally, with the rise of the modern architect, trained in both construction and æsthetics, the four requisites of Inigo Jones could be well fulfilled, as, indeed, we saw them in François Mansart's fine wing at Blois. Henceforth the most vulnerable condition in the quartette was, and is, that architecture should be "unaffected."

In the original mediæval castle at Loches, now a ruin, though in its day one of the most important fortresses in France, at all events, there was no affectation. Nothing could be plainer than the walls of the donjon, relieved only by semi-circular buttresses. Nothing more than solid building was aimed at, and nothing more attained. The interior became a prison, I suppose, when the present château was built, and in it the art of torturing appears to have been brought to an unusually high state of perfection. What is now known as the château was built at the other end of the site by the kings Charles VIII. and Louis XII., that is to say, between the years 1422 and 1515. Picturesquely situated well above the town, the verticality of its fenestration is telling; though from the level of the terrace the unusually heavy string-course becomes almost the most important line in the composition. There was nothing of exceptional interest in the interior, which is no longer inhabited, except the tomb of Agnes Sorel, removed from the church for some reason by order of Louis XVI.

Rising out of the town in the same way as the château of Loches, but with the added advantage of being on the bank of the Loire, is the royal château of Amboise. Here what one sees to-day is but a part of what formerly existed, for Napoleon I., in an evil hour, granted it to one Roger Ducos, who, in order to save himself the trouble and expense of repairs, destroyed a portion of the buildings. What remains is, perhaps, of more interest on account of its fine situation and its exciting and lurid history at the time of the Reformation than as a masterpiece of architecture. In a novel that I read recently an admiring lady described it as looking as though it were carved out of ivory. But such damning praise is totally undeserved. Probably that very spikey row of dormers, which really detracts from the fine proportions of the lower parts of the building, was what evoked the lady's admiration. The tower is interesting. Inside it is a sloping way, up which horses and light vehicles can be brought. It is lighted from above, and the piers around the light well in the centre assist in carrying the inclined vault. The chapel stands isolated from the other buildings, and is an excellent example of what was good in late Gothic. The remains of Leonardo da Vinci lie buried here.

At Chaumont the château is again situated standing high up over the Loire. But it does not rise up out of the town like the other two. From the river it appears part castle, part country house, standing among trees well above the straggling village by the waterside. At closer quarters, however, it becomes much more like the work of the military engineer than of the architect, in our sense of the term. The exterior originally must have been strongly defended. Even now the inserted windows are comparatively few. The entrance to the courtyard is between the towers at the south-east angle, and whether deliberately designed for its effect or not, it is a fine piece of architecture. The coats of arms on either side of the drawbridge—an unusual position—would have been better omitted; but for them, I suppose, the client was to blame. The slots over the entrance to take the arms of the drawbridge are effective features, and we saw a number of them in different places. Originally the building entirely surrounded the courtyard, but in the eighteenth century the north side was taken down, in order, I suppose, to open up the fine view across the river. The increased light and air is probably an advantage to the comfort of the house, which is still inhabited, but the general design naturally suffers from being thus dissevered.

Langeais is another mediæval castle, grim-looking enough from the outside, though restored and inhabited at the present day. The original donjon was built in the tenth century, but practically the whole of the building now standing dates from the fifteenth. In the Middle Ages this château was of great importance, but from the sixteenth century onwards it seems to have passed fairly quiet days. I suppose it was too mediæval to tempt anybody to covet it and fight for it, and too solidly built to suffer much from decay and mutilation. In the year 1840 it was restored, and again about thirty years ago. The work has been most carefully done, and the late owner has gathered together within its walls a most interesting collection of furniture, tapestries, and other domestic accoutrements, mostly work of the fifteenth century. Indeed, both here and at Chaumont the frowning mediæval architecture gains greatly by being continuously inhabited and furnished, if not with the original, at all events with the kind of furniture that it must once have contained. There are also some very good chimneypieces in Langeais, by the way.

Not far from here, and also at the north side of the river, is the little town of Luynes, the chief glory of whose château is its picturesqueness and its magnificent situation. Perched at the end of a range of hills, it has a fine view over the Loire, and looks very imposing when seen from it. But at closer quarters it is neither so big nor so powerful-looking as its neighbour. The buildings are partly fifteenth-century and partly early seventeenth, the latter marking the transition from the exuberance of the early Renaissance to the Classic school of Louis XIV.'s reign. The smallness of scale still remains, but a much greater quietness and sobriety of treatment has arrived.

Brickwork is not common in our part of the Loire country, and the only example that we saw of a brick château was Du Moulin. Built in the latter half of the fifteenth century, this château remained certainly until the middle of th nineteenth in the possession of the descendants of the origina builder. But since then, I fancy, it must have fallen upo evil days. Victor Petit, in 1861, describes it as being carefully furnished in the style of the time of its building. Bu an edition of the Guide Joanne, published twenty years ago only mentions the château casually, remarking that a portio is still standing. Its luck, however, has again turned. Th house was restored about six or seven years ago, is inhabite again, and beautifully furnished with contemporary furniture.

The general plan consists of a square platform surrounde by a moat. The whole of the east side is occupied by th gatehouse and adjoining building. In the centre of th north stands the house itself. Its plan is simple. There ar two rooms on each floor. A projection to the south contain the entrance and staircase, one to the north the offices, pantr and basement stairs on the ground floor, and bathroom above. A picturesque chapel juts out at the north-east corne The kitchen is in the basement, which is not sunk low enoug to be below the water-level of the moat.

The whole group is very quiet and very charming. It i historically a step in advance of the other châteaux that have mentioned, for it is no longer the castle of a feudal lord but the house of a gentleman, fortified, as the times still demanded. One envies the architect who had so interesting building to restore, and his skill in restoring it. I notic he has kept faithfully to the view in Petit's book. One addition only has caught my attention. The flèche over the gate house did not exist in 1860, and as an improvement it i open to question.

At the château of Blois we reach the Renaissance. Th building, indeed, really contains work to suit all tastes—Lat Gothic, Renaissance, and Early French Classic (for I alway think the term Renaissance is hardly suitable to mature an adult architecture, like that of the Louis XIV. wing here) But the chief glory of Blois, in the mind of the ordinar tourist, at all events, is the François I. wing. And certainl it is brave stuff. Curiously enough, it contradicts th proverb that "distance lends enchantment to the view," fo the closer one gets the more one admires the beauty of th detail, and the more one tries to get back and look at it as whole the more one is amazed at the happy-go-lucky way i which the design was set out. Philibert de l'Orme was n born a day too soon. At the time of the Renaissance Frenc masons were past masters of their craft. At Blois, indee there was no difficulty that they could not surmount, an the staircase is undoubtedly a very marvel of dexterity an beauty. But beautiful features do not necessarily mak beautiful architecture. And what was lacking in the earl days of François I.'s reign was the mind of the architect conceive and to control. The Renaissance meant the rebirt of architecture as intellectual design, and although the ol combinations of craftsmen tried hard to master its form they only attained to picturesqueness of detail, and neve reached with them the nobility that they had attained wit their own Gothic. To put what I think of this part of th château into present-day office slang, I should say that it ha been very cleverly "half-inched," but on a series of sma pieces of paper, and that the eight-scale elevations had neve received any consideration. As a result the building is alt gether without rhythm. The vertical divisions of the si facing outwards are almost exasperating. And it seems su a pity that this great accumulation of fine details (for th overloaded cornice on the courtyard side is the only one th is objectionable) were not combined and unified by some sy thetic mind.

The earlier entrance front is a happier piece of wor Here there is no pretence at regular fenestration. Stone sha make vertical divisions, and windows occur anywhere in th panels between. The effect is quiet, and the only blot the design as a whole is the doorway, a feature pushed anyhow, instead of one developed out of the general schem and one again showing the need for the modern archite that was growing even when the Renaissance had hard begun. The figure on horseback is of Louis XII., and modern. I cannot help thinking, by the way, from th iiche in which he stands, that the designer of the doorway vas more used to making tombs and monuments.

This whole front was greatly restored during the latter ıalf of the last century, as, indeed, was the whole château. ıfter the Revolution it was turned into a barrack, mutilated nd ill-used, until, in the early forties, after a tussle between he Minister of the Interior and the Minister for War, it ʼas rescued to be preserved as a *monument historique.* The nly part now remaining unrestored is the interior of the atest building, designed by François Mansart for Gaston 'Orléans about the year 1637, a building that was accounted sin by all true romanticists of the nineteenth century. Most eople nowadays, however, will think less hardly of it. Yet, hough well placed in the courtyard, it does not show to ıe best advantage in its surroundings, for mixed styles in rchitecture never get on together, any more than would Turner, a Raphael, and a Sorolla in close proximity in a icture gallery. The ceiling of the vestibule and staircase is ıe only part of this wing shown to visitors, and it is indeed 'orth coming to see.

After being somewhat irritated at Blois by the way in hich the François I. part, through carelessness of design, ıst misses the point of being really fine, the visit to Villeıvin on the following afternoon was indeed a blessing. [ere was a real gentleman's house, a house that no one ›uld live in without feeling the influence of its ordered renement. The disposition is eminently architectural, not ›solutely symmetrical; for instance, the two end pavilions ıry a little both in dimensions and detail, and the blank all of an orangery comes opposite the west wing shown on ıe screen, but the balance is perfect. The house seems to have ›en fortunate in having been built all at one time, and ithout serious alteration since. I should think that there ust have been stone mullions and transomes in the windows 'iginally, but I don't feel their loss is much to be regretted. › my mind, French mullioned and transomed windows are 'ten rather heavy-looking, and by no means so elegant in ıeir proportions as are the usual English variety. Villeıvin was built by Nicholas le Breton, Financial Secretary Francis I. The Le Bretons were a family of masons, and .is one managed somehow to improve his own house with aterials from Chambord, at the same time in course of ection. Two of the dormer windows on the right-hand side the courtyard were intended for Chambord, and for some ason not used there. Also, the beautiful Italian fountain, ing thought not good enough for a Royal residence, found ; way here. And possibly the exquisitely-refined doorway the orangery wall may have been another little picking. 'hether Francis ever got credit for these when the Chamrd accounts were being settled I have no idea, but the ct that De l'Orme, when appointed Surveyor-General to e Royal Buildings, dropped severely upon another member the Le Breton family, making him refund 18,000 livres er-payment for work at Fontainebleau, is significant.

(*To be concluded.*)

PARLIAMENTARY BILL ON "SEWERS AND DRAINS."

SESSIONAL meeting of the Institute of Sanitary Engineers was held on Monday, October 23, at Caxton Hall, estminster, for the purpose of discussing the Parliamentary ll on "Sewers and Drains." Mr. A. J. Martin, Inst.C.E., F.G.S., F.R.San.I., the president, occupied the ıir.

The discussion was opened by Mr. Percival M. Fraser, R.I.B.A. (Fellow).

The Bill, he said, has been introduced by the request of › Associations, viz., the Association of Municipal Corporans and the Urban District Councils Association, which ve the same objects in view. These societies have as their in objects to protect the interests of ratepayers as affected Public or Private Bill legislation, and are concerned with matters of local government, consequently they cannot ly be said to be representative of property owners.

Their task that evening was the twofold one of deciding ether the promoters have made out a good and sufficient e as to desirability of an amendment of the existing Act l whether the new Bill will fairly achieve this object in the t and most efficacious manner. Probably they would all unanimously in agreement with regard to an amendment the existing Acts. This left them with the single broad ıe for consideration, namely, whether the Bill is one ich will operate fairly between owners of property on the hand, and ratepayers on the other.

The matter has been receiving attention for many years past from property owners and others, and has been actively dealt with by associations interested in questions of Local Government. Bills have already been introduced into Parliament, but up to the present none have succeeded. They have either been dropped or mutilated to such an extent that the promoters have considered themselves justified in withdrawing them. The Lord Chief Justice (Lord Russell of Killowen), at the time, suggested that the time had arrived for consolidating in one Act the whole of the provisions of the Public Health Acts which were not only difficult to read comprehensively, but were not always easily reconcilable. The law might then—to use his Lordship's actual words—"be brought into a coherent and simple form, instead of being, as now, a fruitful source of litigation."

The Public Health Acts Amendment Act, 1907, originally contained clauses dealing with the matter, which were withdrawn as being prejudicial to the interests of the present Bill. The Local Government Board have been approached from time to time with a view to their introducing a Government Bill, but the Board up to date have got no further than promising to give their careful attention to any proposals which might be submitted to them.

This is the genesis of the Private Bill now before Parliament, which is supported by members representative of the associations named.

The Bill was presented and read for the first time during the present Session, but it is practically certain to fall through owing to the pressure of other work, precedence, of course, always being given to Government measures. This means that the Bill is to all intents and purposes even now dead. Should this be its ultimate fate, it will doubtless be resuscitated, and with small but important amendments will be a very great improvement on the existing law.

Mr. Fraser said he did not believe it to be possible to frame an Act on so controversial a subject which would not give rise to legislation, but at the same time an effort should be made to draft an Act free from absurdities so glaring as those which abound in the present Acts.

Under the definition the Public Health Acts, 1875, any drain which conveys sewage from more than one house becomes a sewer vested in and repairable by the local authority. It is not clear whether this is intended to apply only to underground drains, or includes vertical soil pipes, &c. There are many cases of combined use of soil and rain water pipes in terraced or semi-detached houses.

The exact definitions of "drain" and "sewer" read as follows:—"Drain" means any drain to and used for the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating therefrom with a cesspool, or other like receptacle for drainage or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed.

"Sewer" includes sewers and drains of every description, except drains to which the word "drain" interpreted as aforesaid applies, and except drains vested in or under the control of any authority under this Act.

The promoters of the present Bill state that these are faulty on the following grounds:—(a) The extensive litigation which has taken place demonstrates the practical difficulties which arise. (b) It involves frequent interference with private property by the local authority. (c) It burdens the ratepayer with the cost of maintenance of private property in no way to the benefit of the community. (d) It does not permit of the best methods being employed in considering the drainage as a whole.

So far, so good. Nobody would dispute that these comments are just, and to the point. They at the same time show a state of affairs which—though obviously difficult to remedy—present a problem in Local Government (economics) which, aided by the experience of past troubles, should be capable of a rational solution.

The justness of these comments is vindicated by the fact that when the Public Health Act in 1890 was amended, an attempt was made to overcome these difficulties. (This Act, it should be noted, is adoptive wholly or in part, that is to say, the local authority need not, unless it suits their convenience, adopt the Act, or any part of it.)

A section amended those quoted above by providing as follows:—

Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application can be made under Section 41 of the P.H. Acts, 1875 (relating to complaints as to nuisance from drains), and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section, from the owners of the houses, in such shares and proportions as shall be settled by their surveyor or (in case of dispute) by a Court of Summary Jurisdiction.

For the purpose of Subsection 3, the expression "drain" includes a drain used for the drainage of more than one building.

The section of the original Act referred to is briefly as follows:—Any person may notify the local authority as to any drain, &c., in their district being a nuisance, when the local authority is empowered to examine such drain. If the drain is defective the local authority shall cause the owner or occupier to put same into a proper condition at his own expense, or in certain circumstances may do the work at their own cost.

Objection has been raised to this amendment on the following grounds:—(a) It applies only to houses in different ownership. (b) A "single private drain" continues to be a sewer vested in the local authority and, according to the finding of the Courts, unless they are the first to call attention to defects, they must repair it at the public expense. (c) A combined drain conveying sewage to a cesspool is under this section a sewer repairable by the local authority. (d) According to the finding of the Courts, the section only applies if the drain is one which the P.H. Acts, 1875, requires the owners to provide under sections 23 or 25. (Section 23 empowers the local authority to order drains to be constructed to houses without sufficient drainage. Section 25 provides that new houses shall be provided with proper drains.) (e) There must exist in every district many sewers repairable by the local authority, who do not even know of their existence.

It is difficult to know what is really intended by this section, as its effect has been to greatly multiply the number of law cases, and cause unceasing controversy.

The main object of the Bill is stated to be to effect a broader distinction between a drain and a sewer.
